THE BUILDERS'
JOURNAL
AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb.

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND,

An Architectural Causerie.

Cruciform Churches.

THERE has lately been a great deal of talk about the desirability of placing buildings hallowed by Time in charge of a State-appointed Director of Works to whom all proposals for restoration shall be submitted, and whose business will be to be sure that not a stone is displaced unless its removal has been proved to be necessary; the expense of maintaining the office to be borne by generations-to-come of irreverent tourists who, because they pay rates, will maintain their right to be heard. The argument is that we are more than sufficiently burdened already by having the expense of the Church as Established in England to bear, and that as often as Dean and Chapter come begging they should be directed to address their appeals to the said Minister. The change will come by-and-bye. Meanwhile, we hear every day that some beautiful building, either the whole or a part, is in imminent danger of falling, and that funds to avert the impending disaster are urgently needed. The people, thanks to the Press, are being taught by degrees to appreciate the value of what they possess, and we venture to hope that a little information, if it helps them to see where the danger lies, will not be considered superfluous. The cruciform church, with its great central tower, if not peculiar to England, is at least more common here than elsewhere. It is at any rate certain that the collapse of so many towers is due to the fact that the churches were built on these lines. The vulnerable points in every such building are in the piers which carry the lantern. To support the assertion there are more than sufficient facts. The central towers of all these churches have fallen, and we have no doubt that a much larger list could be made:—

Worcester, 1107, and again 1221
Winchester, 1175.
Bury St. Edmunds, 1210, and again 1420.
Evesham, 1207.

St. David's, 1220.
Ely, 1321.
Ripon, rebuilt 1459.
Selby, 1690.
Chichester, 1861.
And Hereford even more recently.

Those of Peterborough, Gloucester, and St. Albans were taken down simply to prevent them from falling, while others, as at Salisbury and Wells, have been saved from ruin by extraordinary precautionary measures. There is a popular book about churches whose author, the Rev. H. H. Bishop, says: "Excepting Beverley, I know of no instance in which the builders of the thirteenth century made any special provision to meet the thrust of the aisle arcades," and, further, that "the Gothic builders almost universally adopted a scheme of plan and section which, although of unequalled beauty, was inconsistent with the fundamental principle of Gothic design. That principle I take to be this—that no pressure shall be left unbalanced." A casual glance towards the centre of almost any

cruciform church will convince the reader that this is a fair account of the matter, and his conclusion will probably be that such awfully bad builders as the Normans undoubtedly were should never have built on these lines. Granted perfectly sure foundations; granted even stupendous weight in the tower, and that the downward pressures permit no deflection from the vertical line, then no amount of force applied laterally would dislocate pier or tower, and to the mind of the modern builder the problem would present no insurmountable difficulty. If he were to work in as reckless a way as the Normans, then would his biography, when it came to be written, be

weakness. But those of Westminster and Salisbury bend like reeds. At Westminster they are held up by iron ties." (As a string to a bow is a "tie" to an arch; it has the effect of converting outward into downward pressure, and the arch, if treated in this way, becomes in effect a "beam.") The case of Peterborough Cathedral supplies a flagrant example of unprincipled building. The central tower was pulled down only to keep it from falling, as that of Ely had done just before. The piers that remained carried only a lantern (or *fleche*) until 1883, when the late Mr. Pearson set up his tower in the style of the Norman original. The piers, to be fit for the weight they were originally

Poblet

A SKETCH BY F. HAMILTON JACKSON, R.B.A.

enlivened throughout with the details of actions for manslaughter. So will it be seen that what we have said applies not to the church of to-day. "The grand old Norman work," says the writer just quoted, "was not altogether good building . . . the central tower in most cases either fell down or had to be rebuilt or buttressed up in order to avoid the ruin which their fall would otherwise have caused . . . the huge piers (which command so much admiration) are mere cases of wrought stone filled up with rubbish." "Very massive piers like those of Lincoln, and those of Durham and Winchester earlier, held down by the weight of the great tower above, show no signs of

intended to bear, had to be rebuilt altogether. His report on the building was that the whole church, in so far as it was Norman, stood upon no proper foundations at all—upon rubble, in fact. The bed rock upon which it should have been founded was only 3ft. below. The massive piers that we boast of are rotten at the core, like our own earth according to Tennyson, and are merely cased with wrought stone—

The arch never sleeps.

Whosoever has this in his mind will come by the shortest way to a well-nigh complete understanding of the loveliest of architectural styles.

E. R.

TALKS WITH BURNE-JONES.

"POPULARITY" & GREATNESS IN ART.

MR. WILLIAM SHARP contributes to the Fortnightly Review, an interesting article on the late Sir Edward Burne-Jones. Mr. Sharp saw Burne-Jones for the last time in May, and found him in a mood of depression. He had but a short time left him, the painter said, in which to work. "Do you remember," he said, "what Rossetti used to say about the fatal month of May?" Mr. Sharp replied that after all Rossetti died in April. Burne-Jones rejoined, "A few days one way or another means little." On June 17th he died.

AN UNPAINTED "AVE MARIA."

Mr. Sharp had met the master in Trafalgar Square, and found him murmuring to himself: "I was thinking," he said, "of a large picture I have long had in my mind to paint—an 'Ave Maria!' I have pondered this in a hundred ways for years past; but ever since dear Morris died I have thought of it much more, for we had talked about it not long before his death. Still I have not been able to get at it. Something brought it into my mind to-day, and what I was recalling to myself, when we met, was a strange little poem that 'Topsy' (a favourite nickname of William Morris among his intimate friends) wrote when we were both undergraduates at Oxford, more than forty years ago. You will find it in a lovely little tale that has never been reprinted since it was published in the Oxford and Cambridge, called 'The Hollow Land.' This is how it goes:—

Queen Mary's crown was gold,
King Joseph's crown was red,
But Jesus' crown was diamond,
That lit up all the bed.

Mariae Virginis.

Ships sail through the Heaven,
With red banners dress'd,
Carrying the planets seven
To see the white breast.

Mariae Virginis."

"Then, abruptly, and with a petulance foreign to his singularly sweet and courteous disposition, he exclaimed, 'But there, you don't expect a spent horse to win a race. Let us say no more about my work. I have done what I could. As for what I have told you, well, we all love to live among our dreams.'"

NEWMAN AND PATER.

In discussing further "the singular raptness in vision" which was characteristic of Burne-Jones, Mr. Sharp says that one of his favourite passages in modern literature was that fine saying of Newman's: "Every breath of air and ray of light and heat, every beautiful prospect is, as it were, the skirts of their garments, the waving of the robes of those whose faces see God in heaven." Another modern author for whom Burne-Jones had great admiration was Walter Pater. "I recognise so much of myself in this book," he once said, "of 'Marius the Epicurean,' that at times it is almost too personal to me to read without disquietude." Another mention of Pater will occur presently.

BURNE-JONES ON MILLAIS.

On one occasion a somewhat Philistine connoisseur was rallying Burne-Jones on his uncompromising devotion to his ideals. "Look at Millais," he said, "no one has achieved so big a success as he has. Yet if he had stuck to his early principles like you and Rossetti, and Hunt, and Morris, and the rest, do you think for a moment he would have become the successful man he is?" "Perhaps not," replied Burne-Jones, slowly, "but he might have become a greater artist." When the connoisseur left, Burne-Jones took up his parable and said to Mr. Sharpe:

"As for what I said about Millais, I feel that deeply, though I could not say more than I did before our friend who has just left, who would repeat my words to all and sundry, and probably to Millais himself. But at nearly all his later work I look with bewildered pain. He might have been so great; but just when his noble powers had reached maturity, the artist died in him, and left only the splendid

craftsman. And this was because he listened to that fatal siren-song of the ignorant and spiritually vulgar multitude, who love to look at pictures, but who are distrustful of—when they are not actually resentful against—Art, unless it be as old (and foreign) as Rembrandt, or as old (and foreign) as Titian and Rafael. As a younger man Millais set himself to interpret noble things nobly, beautiful things beautifully. Are not his 'Autumn Leaves' and his 'Vale of Rest' worth leagues of works such as he has been doing of late? And I for one do not hesitate to aver that Rossetti, in his splendid failure in Art, was far greater both in achievement and influence than Millais is in his brilliant success—as man is to be measured by his soul's reach as well as by that of his hands. What is a man's outlook is as important in Art as it is in life. Many an artist is redeemed from failure by the power of the spirit within him."

"POPULARITY" AND GREATNESS.

Enlarging on this theme, Burne-Jones spoke with swift and eager emphasis:

"If the greatest artist is the man who achieves the greatest success—if the greatest because of this—that author is the greatest whose books have the largest sale. Take this book here ('Marius the Epicurean'). I don't suppose its sale will exceed a couple of thousand copies. But Mr. So-and-So's romance of the impossible in Africa, or Miss So-and-So's romance of the intolerable nearer home, runs to tens of thousands. Therefore, according to you, the shallow and necessarily ephemeral work of a person with inventive mind and a certain literary faculty is greater than a book like this, the deeply considered and exquisitely wrought work of a true literary artist, any single page of which is literature. But the matter is really not worth arguing. There are too few who care for beauty in any Art. The very name of a great writer like Pater is unknown to the vast Mudie world. Yet what writer, truly moved and actuated by the quest of beauty, but would rather be Walter Pater than (leaving aside Meredith and Hardy) all the popular novelists of the day concentrated in one gigantic 'success,' as you would call him? What poet would not rather be Keats, and read by a few hundred, than be Tupper read by a million—or even so good and true a writer in verse as Longfellow?"

THE PAINTER AS SIR GALAHAD.

In another very interesting passage Burne-Jones defined his ideal of the painter's art:

"To be a painter is to be an impassioned votary of truth, whether that truth be a spiritual idea, or an historical circumstance, or an external fact; and to be so wrought by the need of recreating what has moved him that whatever else he has to do in life must be subservient to this end; and to see this new persuading aspect of actual or symbolical truth in the atmosphere of colour, with the contours and horizons of line, to see it to the point of adequate and convincing reproduction within the boundaries of line and the just and beautiful relation of colour. But to be a great painter, a man must also have a great spirit. He must be a dreamer, and not be ashamed of his dreams; must, indeed, account them of permanent worth; he must be prepared for both indifference and hostility; he must be so continent of his faith that he will not barter the least portion of it in order to win a worthless approval; he must be so proud that he will disdain to prostitute his genius to a public use; he must be so single-hearted that, like Sir Galahad, there can be for him only one Sanc Grael, beauty, and only one quest, the lifelong, insistent effort to discern and to interpret in beauty that loveliness, that beauty, which is at once his inspiration, his dream, his despair, and his eternal hope."

THE Metropolitan Tabernacle, London, it is expected, will be ready for reopening in about twelve months. A lecture hall, with accommodation for 1400, is being pushed forward for use in the meantime. The total cost is estimated at £32,000, which is £10,000 over the amount for which the building was insured at the time of the fire.

In the Heights of St. Paul's.

A PILGRIMAGE TO THE GREAT BALL.

A PILGRIMAGE to the top of St. Paul's is a trip to be undertaken once, in one's youth, and once only. At least this is the conclusion come to by a Daily Mail pilgrim. The commencement of the ascent, it is true, is simple enough; the broad, shallow steps being apparently designed for the express object of luring the unwary one upward and onward. After the Whispering Gallery is passed the passages grow narrower and more tortuous; and the way wended becomes darker and dustier. It is not until the Golden Gallery is reached, however, 300ft. above the floor of the dome, that the real difficulties begin. From here the ascent is by a series of iron and wooden ladders; some set at a slight angle, others quite perpendicular. Up, up, up,

AMID A MAZE OF STAYS,

joists, and brackets! Higher yet, to where huge iron girders—hand-worked, and made of charcoal-smelted iron from the Sussex iron-fields—bind the mighty ball and its superincumbent cross to the main fabric of the building. In some places it is hard to squeeze one's body between these self-same girders, of such monstrous thickness are they. And they need be thick, and tense and flawless into the bargain, for they support a weight of more than 600 tons, poised nearly 400ft. in air. Again higher, creeping cautiously up iron ladders set inside a gigantic, up-ended drain-pipe. And then—a species of apotheosised gridiron! That is all. Sixty-five feet below the iron-barred aperture leading to the ball, in a little circular chamber situated immediately over the centre of the dome, but 300ft. above it, is an old man whose time is devoted to extracting shillings from visitors for the very doubtful privilege of climbing as high as the grating aforesaid. Unless the climber on his way down proceeds to ask inconvenient questions, nothing is said concerning this

CLOSING OF THE BALL,

and, doubtless, many people go away under the impression that the stove-pipe arrangement into which they have succeeded in projecting themselves is the veritable interior of the ball itself. But to those who insist upon an explanation a curious story is told. It appears that in the autumn of 1884, the year rendered memorable by the series of criminal explosions which shocked and terrified London, an anonymous letter was delivered to the cathedral authorities. Therein it was stated that dynamite was to be surreptitiously conveyed into the ball, and therein exploded, the object being to hurl the cross from its place, and send it crashing downwards through the triple dome on to the heads of the hapless worshippers below. This may have been a canard; and, on the other hand, it may not have been. The Dean and Chapter inclined to the opinion that it was not. So did Scotland Yard. Result—the gridiron, aforesaid. It was, perhaps, a wise precaution then. But it certainly does seem a pity that now, when the dynamite campaign is as dead as the proverbial door-nail, it should not be abrogated. One thing that must strike every pilgrim to the top of St. Paul's is the number of people who have not been deterred by the sacredness of the place from inscribing their names upon the walls of the galleries and staircases. Thousands of signatures have been cut deep into the solid stone itself; but these, it will be noticed, mostly bear dates ranging from 1700 up to 1760. During that period free access was allowed to this

UPPER PORTION OF THE CATHEDRAL,

and no supervision whatever was exercised over visitors. Later on attendants were stationed at various coigns of vantage, with the object of stopping the desecration. They were successful, so far as the stone-carving was concerned. To carve even one's initials in Portland stone is a work of time. But they could not stop the scribbling in pencil, and thousands of individuals have recorded, in this comparatively innocuous manner, their presence among this wilderness of ladders and joists.

SPAIN:

Its Picturesque Cities and Monasteries.

IV.—THE MONASTERY OF POBLET.*

By F. HAMILTON JACKSON.

THE royal dwelling known as the Palace of Don Martin, for the reason that Don Martin el Humano ordered it to be built in 1397, occupies the upper part of the spacious building, which served as a wine-press, just within the Puerta Real, to the right of which a staircase ascends to it. The king died before the works were finished, and political disturbances suspended them. In 1632 they began again, in the reign of Philip IV., but were soon discontinued, and have never been carried far enough to make the palace habitable. The door at the bottom of the staircase is delicately

ribs, and have been cited as examples of excellent construction in various treatises on the subject. It is thought that the one was originally intended for Royal stables, and that the other may have been a dining-hall for the lay brethren, lying as it does in a similar position to the refectory on the other side of the kitchen offices.

Beyond the library are the internal cloisters, of which there are two, both very ancient; that of St. Estéban, so called because it is close to the chapel dedicated to that saint, also known as that of the infirmary because sick monks were nursed back to health in the rooms on the first floor; and that of the parlour, through which one passes to reach the former, so called because it was the only place in the monastery where the monks were allowed to speak above a whisper and to discuss all sorts of questions. The cloister of St. Stephen was reconstructed in 1415, but the arcade is Romanesque. It is rather more than 18ft. long by 55ft. wide. The Chapel of St. Stephen is the second of the three buildings which Ramón Berenguer IV., of Barcelona, ordered to be built at the foundation of the monastery

burial-place of many kings and great nobles, but before speaking of the burial-places which formerly existed, and of which such small remains have been left by the insensate fury of the revolutionists of 1836, it will be well to give some account of the foundation of this monastery, in which are mingled facts which are historical, and legends. The story is as follows: In the first half of the twelfth century Ciurana and the surrounding country were ruled over by the Moorish under-king, Emir, Almira-Almominiz. In one of his hunting excursions he encountered a hermit called Poblet, in a humble hut in the place called Lardeta, situated in the plain called "La Conca de Barberá," from the shell-like shape of its plan, near to Esplugas de Francoli. The king seized him and put him in prison, but angels having broken his chains three times, he was convinced that he was a person of great virtues, and that Providence protected him. Wherefore he made him a grant of the site of Lardeta, and the document then executed was kept in the archives of the monastery as a precious relic, and a translation was made into Castilian. After the destruction of the

THE MONASTERY OF POBLET. PALACE OF DON MARTIN. CLOISTER FAÇADE.

moulded and carved, and above it are the arms of Aragon. The plan of the building is a rectangle of about 80ft. by 16ft., which was apparently intended for State apartments, the staircase to which was only commenced—that now existing was to lead to the sleeping apartments, which were to have been over the galilee of the church, beneath the rose window in the western wall of which is an aperture communicating with this portion of the building, by means of which the Royal family would have been easily able to assist at the divine offices. The design is of the richest later Gothic, the windows delicately carved, with crockets and moulded arches, the heads filled with graceful tracery between geometric and flamboyant, of which some are square headed and some pointed. As has been said, the basement of this palace consists of a building used as a wine-press, and there are channels which pass to the cellar on the other side of the passage, so that the grape juice might pass straight to the vats without any labour being necessary. Both of these edifices, wine-press and cellar, are vaulted with square

in memory of the three mysterious lights which appeared here, and to which reference will be made a little further on. Close to these cloisters, in front of the chapel, is a courtyard, 125ft. long by 25ft. broad, prepared for the national game of "pelota"—a sort of magnified "fives." It is thought at one time to have served as refectory, but there are no traces of vaulting, nor is it covered in any way.

On the east front beyond this court is a suite of rooms known as the Royal apartments, which have a splendid view towards the south, but are not remarkable, though they date from the fourteenth century. Following the northern wall, we come to the dwellings of the prior and of the apothecary, with their gardens and laboratories, and in the corner, close to the angle tower, is the bakehouse, with its ovens and the houses in which the journey-men lived. In the whole circumference of the wall there are twelve towers, which are known by such names as that of the prison, that of the host, that of St. Stephen, of the infirmary, of the Vicar-General, of the gardener, and so on, and are placed at suitable distances for defensive purposes.

The Monastery of Poblet was the chosen

monastery in 1836 it was removed with other documents to the Academy of History at Tarragona, and an Orientalist was commissioned to make another translation. The first represents the Arabic as a deed of gift, the second only as a permission from the King of Lérida to the shepherds of the monks to pasture their flocks in his kingdom without hindrance or damage. It is to be supposed, therefore, that the first document has perished or been lost, especially as the date given in the document is 614 of the Hegira, which corresponds to 1217 of our era, at which time there was no Moorish under-king in Catalonia, and a hundred years after the date of Poblet. It is certain that the Moorish under-kings left Poblet in undisturbed possession of Lardeta, which was called "Poblet's Garden" from that time. The hermit, with two or three companions, built a little chapel there with a small house in which to lodge.

Ramón Berenguer, the fourth Count of Barcelona, conquered Catalonia in 1148, and desiring to establish the Cistercian order in his dominions, thought that he might very well erect a monastery in the conquered territory. Having heard of the virtues and great

* Continued from page 444, Vol. vii.

THE MONASTERY OF POBLET. THE NOVICES' DORMITORY.

deeds of Poblet and his companions, he asked the Abbot of Fuen Fria to send him the requisite number of monks to form the community of the monastery which he proposed to erect in the domain of Poblet, already sweet with the odour of sanctity, accompanying his request with the donation of the territory. This gift was ratified in 1150, with a detailed account of the rights and dues which he gave up, and these documents still exist. At the same time he ordered the construction of the buildings.

The legend of the mysterious lights is this. The hermit Poblet and his companions observed while at their devotions on each Saturday various rays or streams of light, which hung suspended perpendicularly in the air, and which were so bright as to illuminate the whole space now enclosed within the walls of the monastery. Three spots of light were specially noticeable among the others, which, one may remark, were seen by the country folk as well as by the hermits. One, consisting of but one ray of light, shone in the east; another, more to the west, was composed of

two rays; and the brightest, composed of three rays, shone betwixt the two. Count Ramón Berenguer, having heard of these appearances, determined to plant his monastery in the garden of Poblet, and interpreted the apparition of the lights on Saturday, the day dedicated to the Virgin, as a sign that God pointed out that place for the desired foundation. In memory of the three wonderful lights he ordered three churches to be built, as well as the dwellings necessary for the new community. One of them, dedicated to the proto-martyr, St. Stephen, was built on the spot where the light fell, which consisted of but one ray; another, on the place where the two-rayed light fell, was dedicated to St. Catherine; and the third was the great church, the high altar of which is said to be placed on the spot where the three-rayed light fell. At the singing of the "Salve Regina" it was always the custom in the monastery to light three lights on the high altar in remembrance of the tradition of the three marvellous lights, and in sign of thankfulness for benefits received from God.

The monastery was perhaps the most celebrated and powerful in Spain, possessing, as it did, very large domains, and exercising seigniorial rights over seven baronies, while the treasures of precious objects—church plate, embroidered vestments, jewelled reliquaries, processional crosses, images of saints, candelabra, &c.—reached an enormous value. The relics catalogued numbered 285, and the catalogue ends with the words, "and many other relics without number." It received many gifts from the Kings of Aragon and from the great nobles while living, and contained their ashes after death: the royal sepulchres having been among the finest and most elaborate works of the kind in Spain. Suchet ravaged the church and robbed it of much, but the great destruction was wrought in 1836 by the Spanish revolutionists, since which time the monastery has lain in ruins. The ashes of the kings, which were cast to the winds when the sepulchres were destroyed, were in part piously collected by a local parish priest named Soret, and now rest in the cloister at Tarragona. The body of the great King, Don Jaime I. El Conquistador, is by itself in a tomb which was brought from Poblet and erected, in 1856, against the trascoro of the Cathedral of that city.

The royal sepulchres were situated in the transept between the lateral pillars, carried on arches thrown across so as to allow of passing beneath them. It was Pedro IV. of Aragon who ordered their construction, in the year 1367, with the object of providing a resting-place for the remains of his ancestors and for himself and his successors. The royal personages buried here were: James I. the Conqueror, Pedro IV. and his three wives—Doña Maria of Navarre, Doña Leonor of Portugal, Doña Leonor of Sicily—Ferdinand of Antequera (in whose tomb was also placed, by Ferdinand the Catholic, the remains of twelve Infantes of Aragon, which had previously been contained in wooden coffins). The tomb was prepared by Don Martin El Humano, but his successor appropriated it! These were on the right of the altar. On the left were buried Alfonso II., son of Ramón Berenguer, the founder of the monastery, Juan I. and his two wives, Doña Martha of Armeñach and Doña Violante, niece of Charles V. of France, also their daughter, Doña Juana, Duchess of Foix, Juan II. and his wife, Doña Juana Henriquez, and their daughter, Doña

THE MONASTERY OF POBLET. EXTERIOR OF THE CHAPTER HOUSE.

Marina. There were other royal sepulchres elsewhere in the church. Some of the same date are at the sides of the chapel of St. Benito, in which were buried four sons of Don Pedro IV., and one on the other side containing the body of his daughter Doña Juana. Juan I. also built four sepulchres for his sons above the door to the old sacristy—of all these but small remains are left, sometimes only the brackets upon which the tombs were placed, sometimes not even so much as that. Against the staircase to the dormitory are the mutilated remains of a fine tomb in which was buried the tenth Viscount Cardona, Don Ramón Folch, who defended Gerona against the French in the time of Pedro the Great. It was constructed in 1669 by Juan and Francisco Grau, of Manresa, and cost 4800 pesetas. Against the angle pier are the remains of the tomb of Alfonso V., the Learned, which was made in Naples in the seventeenth century. Opposite to this was the tomb of Enrique de Aragon, Grand Master of Santiago, the son of Ferdinand I. and his wife Leonor—with his two wives Doña Catalina Infanta of Castile and Doña Beatriz de Portugal; and yet another little tomb was here, constructed by Don Martin for his grandson the Infante Don Pedro Fadrique of Sicily, son of Don Martin and Doña Maria, monarchs of Sicily.

The Duke of Cardona, Don Ramón Folch, whose tomb is by the Novices' Staircase, altered the royal sepulchres by building walls from the ground up to the arches, decorated with reliefs of Scripture subjects, trophies of arms and battles, divided by caryatid figures. For this work, much of which still remains, he employed the same sculptors of Manresa, expending nearly 15,000 pesetas upon it. Within the sepulchral chamber thus formed were placed the remains of the following royal personages: On the left—Don Martin El Humano and his wife, Doña Maria; Doña Beatriz of Aragon, Queen of Hungary, daughter of Don Fernando and Doña Maria of Naples; Don Carlos, Prince of Kana, the firstborn son of Don Juan II., who was so dear to the Catalans that one of his arms was venerated as a relic in the sacristy, the Legate in 1542 having granted this concession; Don Pedro, the son of Ferdinand I., and Doña Leonor, and many of the family of the Dukes of Cardona, whose ashes also fill the chamber on the right.

In the Chapel of the Holy Sepulchre are several pavement slabs in high relief, among which is that of an Englishman who died at Poblet in 1731. He is described as the English duke Philip Warthon, Marquis of Malbursi, and Knight of the Garter. Close to the staircase to the lantern there is a large tomb, on the lid of which is a statue of a tall man completely armed. At the right of the Chapel of St. Benedict is the tomb of Don Pedro de Abalate, Bishop of Lérida, and afterwards Archbishop of Tarragona, who died in 1251. His effigy is on the lid wearing his archbishop's robes.

In the cloister, near to the Chapter-house, is a large tomb of the family of Copóns, which dates from 1365, and near to the refectory are five tombs fixed in the wall, better preserved than most. They are supported either by columns or brackets, and are decorated with the arms of the various families to which they belonged. The best of them is well out of the way of damage, above the refectory door, and its brackets are carved with angels, one with a violin and the other with a greyhound (incongruous symbols!), while the tomb itself bears the crest and arms. It dates from the fourteenth century, and there are about a dozen other tombs of similar design in the other ambulatories. In the Chapter-house pavement are eleven slabs carved with figures in high relief, beneath which rest various abbots who died between the years 1338 and 1623.

These tombs give its great historical interest to the monastery, for it forms, with the other great monastery of Santas Creus, a veritable Campo Santo, in which members of all the most distinguished families had their tombs. For the Catalonians and Aragonese they are what Westminster Abbey is to us.

(To be continued.)

ROMAN LONDON.

IN an interesting article on "London's Birth and Infancy," a writer in the Evening Standard observes that it may with fair probability be conceded that London is as ancient as Rome itself, though cautious historians are slow to admit any such assertion. Then, again, it is quite possible that there are in Britain still older sites of established towns; for example, the city of Worlebury, lying on the hill above Weston-super-Mare, has been given an antiquity of 4000 years, and must have been a pre-Celtic foundation. London, like this well-preserved settlement, was originally, doubtless, merely a cluster of burrows in the earth, which, after long years of slow progress, developed into huts of mud, or of clay-coloured wicker. The town was simply a small cleared space in the centre of

thick woods, visited by degrees by foreign merchants in their coracles. There were already trackways leading from it to other British settlements; we do wrong to imagine that all our old

ROADS ARE OF ROMAN CONSTRUCTION.

There were tracks in Britain long before the Romans came, possibly before the Celts came. Speaking of London, as it most probably appeared to our earliest Roman visitors, Penant says, "It stood in such a situation as the Britons would select according to the rule they established. An immense forest originally extended to the river side, and even as late as the reign of Henry II. covered the northern neighbourhood of the City, and was filled with various species of beasts of chase. It was defended naturally by fosses, one formed by the creek which ran along Fleet Ditch; the other afterwards known by that of Walbrook.

THE MONASTERY OF POBLET. PALACE OF DON MARTIN. WINDOW FACING THE GREAT CLOISTER.

The south side was guarded by the Thames; the north they might think sufficiently protected by the adjacent forest." The Romans, finding this convenient centre for commerce already established, must have lost no time in recognising its importance, and would speedily erect more

SUBSTANTIAL DWELLINGS AND FORTIFICATIONS for their own uses. It is usually supposed that St. Paul's Churchyard is the oldest site of building in London; it has even been asserted that a burial-ground of the Britons was situated where the great Cathedral now stands. When Sir Christopher Wren dug here for the foundations of his erection he discovered ivory and wooden pins, which were explained as having been used to fasten the funeral garments. Digging still deeper, the architect found sand and sea shells, representing that geologic period when the ocean flowed above the present busiest site of modern civilization:

"There where the long street roars, hath been
The stillness of the central sea."

If we can regard Wren as a satisfactory authority, we must get rid of the idea that there had been a temple to Diana on the site of St. Paul's; but, though the eminent builder failed to discover traces, figures of the goddess have been found not far from the site, though not immediately under it. It is interesting to note that in the old rhyme, "London Bridge is broken down," sung by children at their games, there is a trace of the ancient custom of burying persons alive beneath the foundations of bridges as a means of ensuring their strength and permanency. That this cruel superstition was observed in the first London Bridge is not very probable. We may safely assert that the Romans would not have practised any such barbarous rite, though the heathen Saxons might possibly have done so when they came later. The earliest mention of any bridge in London is in the writings of Dion Cassius, in the beginning of the third century; and we may be safe in concluding that the first settlers at this spot were totally unfitted, by civilisation or instruments, to erect anything at all in the nature of a bridge. The extent of the Roman London may be gauged by the

TRACINGS OF THE WALL.

This reached from the Tower to Aldgate and Bishopsgate, along Roman Wall to Fore Street, through Cripplegate, Newgate, and Ludgate. Modern London dates entirely from this Londinium of the Romans. In spite of what is said by the chroniclers about the beautifying of the City by King Lud, who was buried at the gate bearing his name, we cannot believe that any town of real consequence preceded the coming of Caesar. For traces of Celtic Britain we must look elsewhere—to Caerleon-on-Usk and to Caerleon-on-Dee (Chester), to Exeter, Gloucester, Bath. More of romantic tradition, legends of Arthur and the early bardic days, clings to these places. It is in Wales and in the West of England that Celtic Britain has been least Anglicised. Nevertheless, when treading the streets of London city we can feel that we are in the very footsteps of the ancient Britons, whose wicker boats once floated lightly over the Thames, and whose low huts were clustered on its marshy banks. Celt, Roman, Saxon, Dane, Norman, have all done something towards the making of London, as towards the making of the British people; and the patriotic Briton has the satisfaction of knowing that he is the composite production of them all. Our strength is derived from many sources.

THE Guardians of St. Olave's, Borough, have voted £2000 for the erection of a Roman Catholic Church and a Protestant Church in connection with their new workhouse, now in course of building at Ladywell, Lewisham, which is to accommodate 600 inmates.

SOME consternation was evinced in the City last week at the sight of a huge ventilating shaft, as high as the Royal Exchange, erected in front of the Mansion House, as part of the works of the Central London Railway. It is stated, however, that the structure is only temporary.

The R.I.B.A. and the Government.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The arrangements entered into for the erection of the new Government offices call for some comment.

It is generally understood that the plans for these buildings were prepared in the Office of Works, and that, after this was done, the Government requested the Royal Institute of British Architects to draw up a list of names, from which two might be selected by the Government to provide the elevations. There are two points here that call for special remark. The first is this: The Institute does not—probably never has and never will—include the best men in Architecture, or represent the highest in thought or ideal. This is the plain truth, there is no use disguising it, and no one knows it better than the Institute itself. If, therefore, the selection is to be limited to members of the Institute, the best men are necessarily left out, and the country is deprived of their services just when they are most needed. If the selection is not to be confined to members of the Institute, the Government, by leaving the choice in its hands, places before it a great temptation—the temptation to recommend its own members, to the prejudice of better men. If the Government did limit the selection to the members of the Institute, surely the plain duty of the Institute—incorporated for the "advancement of civil Architecture," not merely for the advancement of the interests of its members—was to advise the Government that the best men would be excluded, and, in the highest interests of Architecture, to insist on their inclusion, or to decline the task. If the Government did not limit the selection, it can only be inferred that the Institute yielded to temptation.

It may be that the Government knew well what it was about, and that in applying to the Institute it felt confident of obtaining not necessarily the best men, but the men it wanted, viz., those willing to accept its peculiar conditions; and this brings us to the second point—the extraordinary conditions under which architects are expected to work. Not, mark you, by a little local vestry of greengrocers, but by the Imperial Government—men of presumed education.

The essence of the architect's work, the broad conception, the scheme of construction, is to be evolved by an official, and then the architect is to be called in, presumably to invest it with artistic merit!

It can only be said that if the Government possesses an official competent to grasp such schemes as these, to mould and group them, and set them out on fine artistic lines; in short, to draw an artistic plan as architects understand the word, he will also be competent, and more than competent, to finish his conception with appropriate and tasteful detail, by far the easiest part of the work, and a thing that could well nigh be done by any clever student of five-and-twenty. So it is not very clear why they employ an architect at all.

It is quite unnecessary to point out the utter impossibility of obtaining the best work by any such means; no artist would do himself justice under such conditions. His only chance would be to consider the plans already prepared simply as a schedule of the accommodation required, and to start afresh with an unbiased mind. Judging from previous experience of the ways of officials, he would not be likely to get this chance.

In these days, individual architects have frequently to accept work under conditions which they resent, or else to starve. Possibly they do right to accept; individual protests do little good, and life is sweet—even to an architect. But what an individual cannot do a society can, or why does it exist? and one would have thought that the obvious duty of the Institute, as representing the interests of its members—not to mention the interests of the sublime art which they all profess to serve—would be to protect its members from being placed in the painful position of having to make a choice between their self-respect and their daily bread.

Although it may be considered that the Institute may safely be left to reckon with its own members, and that if they do not mind no one else has a right to complain; yet, for all that, the proceedings of a professional society do reflect on the prestige of a profession generally, whether such society be representative or not. And though the Institute may be willing—may even be proud—that its most distinguished members should be employed as chief draughtsmen to Government officials, yet this is hardly the ideal of the rest of the Profession.

For these reasons every architect who respects his vocation must deplore the fact that the Institute did not rise to the occasion, and for once really represent the whole Profession and voice the common sentiment, by entering a vigorous and public protest against conditions which it must feel to be unworthy and damaging to the truest interests of Architecture.—Yours, etc., A. R. JEMMETT.

[We are not with Mr. Jemmett in laying these charges at the door of the R.I.B.A. The fact that the name of one of the selected architects—Mr. Young—was not included in the list submitted to the Government by the Institute would seem to show that the Government reserved, free from obstruction, an "open door" to a wider field of selection. The Institute was appealed to for practical advice; it responded with a list of eight names of candidates, and we think it is uncharitable, not to say unfair, to presume that the names were not honestly chosen. Whether the Government's selection be generally approved or not, the Royal Institute of British Architects can only be held responsible for one appointment—Mr. Brydon's—and in nailing down this responsibility it must be remembered that the Government had, as stated, the free option of going entirely outside the Institute list. This fact, of course, would not justify dishonest advice on the part of the Institute; but then Mr. Jemmett does not adduce a tittle of proof in substantiation of his suppositions.—Ed. B. J.]

THE Bishop of St. Andrew's consecrated the new chapel at Mar Lodge on Sunday week. The chapel, which is of Norman Architecture, is situated at the back of the mansion.

PLANS for the reconstruction of the interior of South Queensferry Parish Church, Linlithgowshire, prepared by Mr. Chalmers, architect, have been approved of by the Kirk Session and Presbytery. The cost will be £400.

IN carrying out the programme of Her Majesty's Government, additional buildings are required at Lancaster and Bury. These are to be erected immediately, and the contracts have been given to Mr. Samuel Warburton, of Miles Platting.

HAMPSTEAD is threatened again. Plans for developing a fine site in the rear of the Hampstead Vestry Hall for high-class property having been thrown out by the London County Council, a scheme is now on foot for covering it with a colony of artisans' dwellings.

A FREEHOLD site in Nightingale Lane, Clapham Common, has been secured for the new premises of the Jews' Deaf and Dumb Home, whose building in Walmer Road, Notting Hill, has been condemned by the inspector of the Education Department as inadequate.

MESSRS. McDONALD AND ABERNETHY, the engineers for Heysham Harbour, report that good progress has been made with this work during the past half-year. The outer sea embankments have been formed for rather more than half their total length, for which purpose about 200,000 cubic yards of material has been excavated from the adjoining cliffs.

IN February the Town Council of Canterbury decided to buy two houses in Guildford Street and also two in High Street, immediately adjoining the present Guildhall, for the purpose of obtaining an enlarged site for the erection of a new Guildhall and municipal building. Since then an adjoining property in the High Street has been offered for £3000, and at a special meeting last week the Town Council decided to purchase the property.

ARCHÆOLOGISTS AFIELD.

II.—IN LANCASTER AND DISTRICT.

THE annual meeting of the Royal Archaeological Institute was concluded at Lancaster a fortnight ago. The series of visits included one to the magnificent and historic church of Cartmel. The history and architectural features of the church were explained by Mr. W. St. John Hope, M.A., who pointed out that it was founded in 1178 by William Mareschal, Earl of Pembroke, and was a priory of Austin Friars. The difference between it and Furness was that whereas at Furness the whole church and the whole Abbey were entirely restricted to the Cistercians, when the Friars came to Cartmel they found a parish church existing upon the site. They took possession, apparently, of the eastern portion of the parish church, and began to build, on a very much larger scale, a church for themselves, consisting of a central tower, the north and south transepts, and a presbytery with its aisles. After leaving the church the party were shown, in the centre of the village, a remarkably fine gateway, said to be the entrance to the original priory, and in driving to Cark Station, Cark Hall, a mansion of architecture somewhat later than Elizabethan, was pointed out to them as the residence of the antiquary Rawlinson.

HALTON.

At Halton, to which a visit was also paid, the pre-Norman carved stones in the church and churchyard were described, and the ancient road by way of Redwell was taken to Melling, where the venerable vicar, and typical antiquary, described the objects of historical interest. He said there was no church in the Valley of the Lune where there were not evidences of Saxon work, and the objects to which he drew attention (all carefully preserved in the interior of the church) were a portion of the churchyard crucifix (pre-Norman), a pre-Norman monumental stone, found below the belfry floor in 1869, a memorial slab (fourteenth century), the key-stone of a Norman arch, &c. The chantry in south aisle was formerly the property of Lord Morley, of Wennington. The oldest window was in the south aisle, 1260. The tower was of a character peculiar to several in the Valley of the Lune, evidently about the same date, 1450 A.D. The bells of that church rang out their peal to give a cheery welcome to Sir Edward Stanley on his return from Flodden Field, and the peal of six, to which they were afterwards increased, were as sweet as any peal in North Lancashire. In these days of endless societies he would, after all, rejoice in the founding of one more, for the preservation of ancient bells which have marked the occasions of joy and sorrow to successive generations, instead of their being put into the melting-pot, as had the bells of a place not sixteen miles distant. He hoped no such doom awaited the bell at St. Chad's, Clough-ton (1296), the oldest in Lancashire. Many objects of antiquarian interest were shown in the Rectory, including old bells, old china, old prints and portraits, and a drum, bullet-pierced, left at Melling by a straggler of Prince Charles's army (1745).

HORNBY.

At St. Margaret's Church, Hornby, the Rev. J. C. Cox, LL.D., F.S.A., corrected the impression that that church occupied the site of the old priory. The priory stood on the right of Priory Farm. The erection of that church was due to the first Lord Mounteagle, Sir Ed. Stanley. There was hardly anything left standing of the old priory, save a few pre-Norman stones and several slabs of a later date. The tower of St. Margaret's was of a character they did not often meet with. It was octagonal, and the upper part was set diagonally to the base. The arms of Sir Edward Stanley figured upon the church tower, encircled with the order of the Garter, of which he was such a distinguished member. He congratulated the church on possessing a monolith of early Saxon date of unique character. He thought most probably it came

from the priory. He also directed attention to a Renaissance altar cloth of the seventeenth century, which was carefully preserved in the west end of the church. One of the bells was dated 1751, and the rest 1761. Dr. Lingard, the distinguished historian, lived in that village; at his death, not only was a memorial brass erected in his own Catholic church, but one was placed in the church of St. Margaret's—showing how he was esteemed. At Hornby Castle the party were received by Colonel Foster, M.P. Mr. W. O. Roper, F.S.A., took his audience over the historic ground—Hornby, the site of a Roman station at the junction of two Roman roads, one from Lancashire and the other from Yorkshire. Thence to Domesday Book is a blank. Edward Stanley came to reside at Hornby Castle towards the end of the fifteenth century. Mr. Roper described the siege and capture of the castle by the Roundheads, also the Morley connection, and its abandonment by them on account of the fines levied on Roman Catholics. The connection of the notorious Charteris was treated, and the famous will case, which brought up the present prosperous days of the Castle.

MYTTON.

Whalley and Mytton were visited on the concluding day. The Rev. J. C. Cox, LL.D., F.S.A., described Mytton Church, and said the evidence was not conclusive that the old screen of the chancel came from Cockersand Abbey, although the inscription recorded. It was made in the time of William Staynford, who was Abbot of Cockersand 1505-9. The advowson of the church had been presented to Cockersand Abbey, but the inscription on the screen was interrupted. The idea that the small doors before a window in the chancel indicated these were leper windows was a myth. Lepers would not have been allowed to approach a church, as there were English leper houses with their Father Damiens, and the most probable explanation was that these doors were there so that the servant could ring the Sanctum bell for early mass without standing outside the church. He thought the shaft of the churchyard cross was in the angle of the chancel outside. It was not Saxon, but contemporaneous with the present church.

WHALLEY.

Mr. J. T. Nicklethwaite, V.P.S.A., described the many curious features of Whalley Church, and expressed the hope that very careful notes would be taken by archaeologists, because a future generation would not believe such curious features in the pew arrangements, &c., ever existed. With reference to the pews called cages, he pointed out that on the Nowell's pew, or cage, were two inscriptions and two dates, 1534 and 1610, the latter being a parody on the former. He thought 1610 marked the end of the quarrel as to the pews. The smaller pews in the body of the church were of the time of Charles I. Nobody could kneel in them, and he thought they must have therefore been used by the men, as the women only in bygone times used to kneel in church. The constable's pew near the church door (1714) was undoubtedly placed there so that the constable could see who came to church, as there were a great many recusants about there, and people who did not come to church were fined. The abbey remains were described by Mr. St. John Hope, M.A., and he refuted the fables often expressed in print that the monks of Whalley were fat old feasters. They lived plain and godly lives, and were vegetarians.

THE foundation stone has been laid of new day schools that are to be built in connection with St. Joseph's Catholic Church, Sale, at a cost of £2000.

THE Local Government Board has held an inquiry at Cardiff, respecting an application by the Cardiff Corporation for the sanction of the Board for borrowing the sum of £14,500 for the purpose of establishing a fish market on the eastern side of Working Street, £6220 for the alteration of Roath Market, and £2985 for streets improvements in Llandaff Road and Leckwith Road.

NATIONAL ART.

EXHIBITION AT SOUTH KENSINGTON.

THE exhibition, in the annexe to the South Kensington Museum, situated on the southern side of the Exhibition Road, of the works in various branches of pure and applied Art by students who have been successful in the competitions of the present summer is now open to the public, and will remain on view until August 31st. Though it contains, as it always does, certain elements of interest, the average reached is decidedly below that of the last two or three years. Considering the vastness of the machinery set in motion, the great complex of schools and branches of which this exhibition is the outcome, it cannot be concealed that there is something mean and disappointing, as a whole, in the display which it affords—something small, cramped, and too little suggestive of initiative or a

PERSONAL CONCEPTION OF ART

on the part of the students. Even in these initial stages of artistic training, in which, no doubt, it is indispensable to obtain in the first place accurate technique and a solid foundation to build upon, more encouragement might surely be given to personal interpretation as distinguished from mere representation or transposition of the thing rendered, whether it be a human form, a group of fruit or flowers, or an arbitrary arrangement of precious objects. It is again in decorative Art proper—both in wall-papers, stencilled hangings, posters, book illustrations, and designs in the higher and the lower relief—that the greatest measure of originality is to be found. Even here, however, the average is not so high as on some recent occasions. Considering the vastness of the field, there is legitimate cause for complaint that better examples are not furnished to the students from which to model, paint, and draw. Among the fine things are many which are less than fine—too many doubtful and commonplace specimens of

LATE GREEK AND GRÆCO-ROMAN ART.

too many insignificant sculptures of the Quattrocento, which can furnish so many of unsurpassable beauty. Here is, once again, our old friend—or enemy—the "Hercules with the Golden Apples," a coarse and conventional bronze statuette of Asiatic Greek origin, which has little to recommend it but a certain accuracy of proportion. Better and more authentic Donatello could be found as models than the popular, but by no means convincing, "Santa Cecilia," in the collection of Lord Wemyss, or the "Giovanni" of the Louvre. And why need the masterpieces of Gothic sculpture, as we see them at Amiens, Chartres, Rheims, Paris, Strasburg, and Bamberg be wholly excluded? The bust of Voltaire by the eighteenth-century master, Houdon, is most welcome; and we should like to see the students at work on examples of the seventeenth and eighteenth centuries, among which, though the teachers apparently shrink from them in doubt, there are not a few masterpieces of the first order. It is clear that little or no latitude is given to the student in drawing, painting, and modelling from the nude figure. There are not

A FEW GOOD AND CAREFUL PERFORMANCES

in this branch, but hardly anything through which the personality of the nascent artist can be guessed at, even should it exist. A capital and very searching piece of modelling is the "Nude male figure," exhibited by Mr. John C. Blatchford, of Bristol, which has obtained one of the gold medals; but it savours too much of the studio model placing himself obediently in a prescribed position, too little of Nature generalised, accentuated, interpreted so as to become Art. Though less completeness and less skill are displayed in Mr. Frank A. Wright's "Model of figure from the nude," it has an infinitely finer motive, and far more suggests the statue, the work of Art, far less the mere modelled invitation of an individual human form. Mr. Charles Palmer's "Model of male figure from the nude" has good qualities, but too nearly recalls in its attitude

one of the famous "Slaves" of Michel Angelo in the Louvre. The numerous "still-life" groups show rather more cohesion and significance than last year. There is, nevertheless, much to be done yet in this direction. Let the students consider the great Netherlands of the seventeenth century, but above all Chardin, and, among the painters of to-day, M. Fantin-Latour. The flower drawing is, in many instances, of great delicacy and beauty, and accurate enough withal to serve the purposes of science as well as of Art. Mr. Robert Bertram has obtained with a "Design for a wall hanging" of small proportions, but of large style, a gold medal, which, on the whole, he deserves. He should certainly be allowed

TO CARRY OUT HIS DECORATIVE SCHEME

on the large scale which it calls for. Miss Jennie Delahunt's "Modelled design for the side of a room" (silver medal) has a certain monumental character, and would also gain by enlargement. Miss Marian Pearson's "Modelled design for a frieze" has both fancy and charm, and deserving of equal commendation is Mr. James Begg's "Modelled design for a door-knocker." Among the wall-papers and stencilled hangings are several in which genuine invention and a good sense of balance in design are exhibited. Colour frank and rich in its harmony is curiously rare in this branch of decoration. It is as if the effort to get away from the exquisite but, if anything, too subtle harmonies obtained by Morris from Oriental sources had resulted in combinations either acrid and displeasing or else too dull and timid for wall decoration on a large scale. A striking exception is furnished by the "Design for a stencilled hanging" by Miss Esther Tatlow, of Wolverhampton, which in design and arrangement is, perhaps,

THE BEST THING IN THE EXHIBITION.

The combinations, both daring and harmonious, of gradations in red and pink, deep, strong green and blue, evidence the fruitful study of both Oriental and Gothic examples. Mr. H. Ernest Simpson's "Stencil designs for wall-filling, frieze, &c.,"—which, by the way, carries off a gold medal, while Miss Tatlow's work only obtains a silver one—has a delightfully well-balanced and a fairly novel design, but a scheme of colour dull in its undecided light tints, and, on a large scale, ineffective. Very noticeable is again the success of the provincial Art schools in their competition with the headquarters at South Kensington. Judging by results, some few of them, notably Glasgow, would appear to allow more elbow-room, more discretion, more space for self-development to the students than they obtain at the main establishment in London. There is, nevertheless, great room for reform and improvement in this particular, both at South Kensington and in the provincial centres.

THE foundation stone of a new Baptist chapel at Broughton has been laid.

ONE of the difficulties encountered in purchasing the Golder's Hill Estate for the purpose of adding it to Hampstead Heath was the necessity of dealing with the house. No doubt it could be let at a good rent, and it is understood some offers have been made; but Hampstead Vestry made the grant of £10,000 on condition that the whole of the property should be purchased, and this condition stands in the way. The plan which now meets with most favour is that the ground floor of the house should be used for the sale of light refreshments, and the upper floors should be utilised as a natural history museum. It would certainly be regrettable if the mansion recently occupied by the late Sir Spencer Wells were lost even temporarily to the public. From nearly all the windows there are beautiful views of the distant country. On the ground floor is a very fine dining hall, and all the reception rooms are spacious and well planned. The house is old, but was refaced by Sir Spencer Wells in 1875. On the first floor is a delightful little room, where Sir Spencer Wells both slept and did much of his writing. By the staircase is a pretty coloured window, put up by the Wells family, in memory of Lady Wells, who died some years ago.

A FAMOUS LONDON PRISON.

THE MARSHALSEA.

THE London County Council some weeks ago sanctioned a "Metropolitan improvement," the prospect of which has caused some perturbation in the minds of lovers of Dickens Land. It was proposed to expend something over £200,000 on the widening of Long Lane and an extension of Tabard Street (formerly Kent Street) through St. George's Churchyard into the High Street, Borough. Forthwith the report got abroad that this operation would involve the destruction of what yet remained of the later Marshalsea Prison, immortalised by Dickens in "Little Dorrit." The contemplated Metropolitan improvement will not, however, improve the Marshalsea of Dickens off the face of the earth. After undergoing various changes since 1842, when, happily, it ceased to exist as a prison, the buildings of the gaol passed into the hands of Messrs. Harding, who have not destroyed more than the eastern or felons' portion of the prison. The whole of the debtors' portion remains, and that is the portion which is associated with "Little Dorrit," and with Dickens himself. The County Council improvement will pass it by. It is to be hoped, therefore, that for many years to come the actual houses and the actual walls (lower than they were, and without the fringe of spikes which once crowned them) will remain as a monument of one of the most famous works in English literature.

THE TWO MARSHALSEAS.

It must always be borne in mind that this Marshalsea—Dickens's Marshalsea—was not the original prison so known, but was the old "White Lion" Prison, originally the "White Lion" Inn, which was converted for the purposes of a gaol in about 1558. A hundred and fifty years later its unwholesome condition became too scandalous even for that age of barbarity in the treatment of prisoners, and the inmates were temporarily incarcerated in the old Marshalsea Prison. A few years later a new county gaol was built partly on the site of the old White Lion Prison, and this in turn gave way in 1811 to the later Marshalsea, another new county gaol having in the meantime been erected in Horsemonger Lane. The later Marshalsea was practically a new building, but it seems probable that the massive brick enclosing walls of the old county gaol were retained; indeed, some of the brickwork still to be seen there may even be a relic of the White Lion Prison itself. Dickens's Marshalsea was thus, to a great extent, a new prison at the time when Dickens's father was there in 1824, and when the Marshalsea scenes of "Little Dorrit" were laid within it. This is a point upon which there has been some confusion, but careful reference to contemporary maps and documents makes it abundantly clear.

THE SITE OF THE OLD MARSHALSEA.

The original Marshalsea, the foundation of which dates far back into mediæval times, lay a little distance to the north of the "White Lion" site, as may be ascertained by anyone who will examine the locality by the aid of Horwood's great map of London, of which this particular section is dated 1799. Crossing London Bridge, and entering the Borough High Street, the wayfarer bent upon Marshalsea topography will come on his left to Newcomen Street, formerly King Street, and before that "Axe and Bottle Yard." If he will go down King Street he will see over the door of the King's Arms Inn one of the finest and largest inn signs yet remaining in London, the Royal Arms, carved in stone, with the date 1760, and the words "King Street" in large letters beneath. Returning now to the High Street, the next turning on the same side as Newcomen Street is, and always was, "Mermaid Court." Between these two lay the original Marshalsea Prison, the second in importance of all the London prisons throughout the Middle Ages and the Tudor and Stuart periods. Nothing of it remains on the site, but views of it have been preserved, and its sad history is full and complete. As it is not possible to speak of the later Marshalsea without refer-

ence to this, the original prison, which stood so near it, and which was, in fact, transferred to it in 1811, it has been thought well to deal with the earlier gaol in a preliminary article, and to leave the description of the later, and to most people more interesting, Marshalsea to a second article. In Wilkinson's "Londina Illustrata," a treasure-house of old London views, will be found a plate representing the old Marshalsea as it existed in 1811, a plan of its site, and a brief history of the Marshalsea Court and its jurisdiction. The existence of the ancient Marshalsea is indicated in an order from Edward III. in 1374, empowering "the good men of Southwark to rebuild in our Royal Street which extends from the Church of the Blessed Margaret towards the south a certain House for the safe custody of the prisoners of the Marshalsea."

OLD VIEWS OF THE PRISON.

These are a few only of the facts connected with the old Marshalsea Prison, the second of the five great prisons existing in the reign of Queen Elizabeth and earlier. The first was the tower; the second the Marshalsea, attached to the King's House; the third the Fleet, for Westminster Hall; the fourth the Compter, for the City of London; and the fifth the Gatehouse, for the City of Westminster. Views of the Old Marshalsea are preserved in the Guildhall Library. The first view is of the western portion of that range of buildings; at the end is the transverse wall, against which the prisoners played fives and racquets. This view was made in 1803. The other one, made in 1809, shows the eastern portion of the same range of buildings. The central portion, the house supported upon columns, is the Court Room, the interior of which was very handsomely decorated "with panels on the walls, a coved ceiling ornamented with flowers, shields, and the Royal badge of the portcullis, with crowns and sceptres, the whole said to have been the work of Inigo Jones. At the upper end of the room was the judge's seat, surmounted by a finely-carved pediment and a large decayed painting in a frame behind it." The building on the extreme right of our second view, adjoining the Court House, was known as "The Oaks," and was allotted exclusively to women, but the yard was common to both sexes. There were in all upwards of sixty rooms, and each room held three prisoners. Such are some of the memories of the ancient Marshalsea—

Old, unhappy, far-off things

which haunt every historic corner of the metropolis, and cluster thickly around the prosaic block of buildings between Newcomen Street and St. George's Church.

It will be remembered that at the time of the summary dismissal of Mr. Weale, the Art Librarian of South Kensington, immediately after giving evidence before the Committee of Inquiry into South Kensington Museum, the Department of Science and Art was strongly criticised for what was thought by many to be the punishment of a servant of the department for frankly testifying to the state of affairs in South Kensington Museum and the intimidation of future witnesses. This view, which was dismissed by the more moderate of the department's critics as being far too severe, is actually that adopted by the Committee themselves. We learn that one of the paragraphs in the forthcoming report contains the following strong expression:—"Your committee desire to record their opinion that the termination of the engagement of Mr. Weale, late keeper of the Art Library, immediately after the rising of the House in 1897, and subsequent to the giving of evidence by Mr. Weale, in which errors and abuses of administration in the museum were freely exposed, very much resembles a breach of privilege and an infringement of the immunity usually enjoyed by witnesses before committees of the House of Commons." In all probability, therefore, we have not heard the last of this manoeuvre. What experts have thought of the action of the department in getting rid of one of their most efficient officials is shown by the British Museum having at once snapped him up for work in that department.

Concerning Casements.

IN issuing his latest catalogue, Mr. George Wragge, of Wardry Metal Works, Salford, modestly hopes that it "may have a value beyond that of the ordinary commercial type." We think the Profession will readily concede that Mr. Wragge's hope is materialised, thanks to the charming illustrations supplied by Mr. Edgar Wood—of which we republish three examples—and to the exhaustive manner in which Mr. Wragge has treated his subject, which, be it understood, is not confined to metal casements solely, but embraces metal work in almost every known variety. Apart altogether from the artistic touch Mr. Wragge has imparted into every page of his catalogue, the contents are, in point of utility, considerably enhanced by the addition of full-sized drawings of sections of casements and details of rebates, which the architect will find very helpful in specifying for windows. Side-hung and top-hung casements for the highest class of work, and those of simpler form also, are shown in the first section, and casement fittings in the second. These fittings can be made to suit any details for wood casements, and as they are made at the firm's own works, the carrying out of special designs is obviously facilitated. The coinage or bronze metal used, is of a special mixture, and, with age, takes a beautiful tone; a like effect, however, may be at once attained by a special process, which is both permanent and pleasing. Sashes in wrought steel, iron, and gun-metal, which are now used almost exclusively in place of cast, receive adequate illustration, after which the big subject of metal work generally is treated at some length. Gates and grills, chancel screens, altar rails and standards, dog grates, fenders and irons, railings and balustrades, gas and electric light fittings—all these and sundry others are subjects receiving ingenious and artistic treatment. The manufacture of leaded lights and stained glass is also embraced in the executive energies of Mr. Wragge's staff. Mr. Wragge recognises the affinity between this branch of art work and the casement staple of his industry; he recognises that matters are often simplified and expedited when the maker of a casement also supplies the leaded lights, when required, and executes the glazing, and hence the combination. In our left-hand illustration are seen several examples of hanging signs which are made in wood or metal; name plates, stallboard signs, &c., are made in bronze, aluminium, &c., both cast, wrought, engraved, or repoussé. On the right are illustrated casements and frames of steel, hung at cill to fall inwards. Over-page we illustrate the opening-outwards, hung-double-folding, without-centre meeting-rail variety. We congratulate Mr. Wragge on having produced such an excellent catalogue.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 10th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MONMOUTHSHIRE COUNTY-COUNCIL has appointed a Committee for the purpose of acquiring the historic ruins of Tintern Abbey and Raglan Castle for the county. The Marquis of Worcester, who is disposing of his Monmouthshire estates, is anxious that the famous ruins should pass into the custody of some public body. The Committee will, it is stated, offer to purchase the ruins, and, if successful, a Bill will be promoted in Parliament asking for powers for the payment of the purchase price by the County Council.

THE Royal Academy will probably close its doors before the public realises that one room in the present Exhibition is arranged on a system different to any that has obtained before. Many critics have noticed, says the *St. James's Gazette*, that the architectural drawings seemed to be far more interesting than usual, but none observed that Mr. T. G. Jackson had hung the walls this year with original designs, instead of merely academic drawings or views of ancient buildings that would be more appropriate to the Black and White Room. One result is that the average of work exhibited is distinctly higher than in many recent years, and the care taken in colouring or drawing a plan and elevation is now infinitely superior to any work of the kind sent in some twenty years ago. From the restraint and originality of many of the

designs it may well be argued that English Architecture is on its way to form a distinctive national school such as few other countries at present possess. We shall soon have a few capital opportunities for seeing whether this is true.

It is by no means unusual to hear that "everything ended in smoke," but such an expression is generally applied to a rumour or scandal. It becomes much more surprising when it is made manifest that such may be the fate reserved for such august and solemn structures as Lambeth Palace. Yet Earl Stanhope, in a letter to the Lambeth Vestry, predicts this as a possible end to the home of our Archbishops. It appears that the Palace is gradually falling away before the onslaught of the smoke-fumes of the neighbouring pottery works. For some years the work of destruction has been going on, and the stone of which the Palace is constructed is peeling off and has already considerably decayed. Lord Stanhope, as one of the Ecclesiastical Commissioners, has watched the gradual decay of the walls for some years, and had many conversations on the subject with the late Archbishop of Canterbury. The London County Council has informed his lordship that the duty of dealing with smoke-fumes and their incidental damage does not rest with them, except in default of the local sanitary authority. Almost all the trees planted on the Embankment have been destroyed by these fumes; but the only grounds on which the sanitary authorities can proceed are those of public health, and it has not been shown that the smoke nuisance is injurious to the public health of Lambeth.

BEFORE the Great Fire in 1666 it was within the reach of man to make London the most beautiful city the world has ever seen. Then Christopher Wren's genius might have created out of its ashes one of the most superb cities in Europe. A contemporary sketch shows what the approaches to St. Paul's Cathedral would have been if Sir Christopher Wren had been given a free hand. From Temple Bar to Aldgate he intended to lay out one spacious street, having in the middle a large square, which was to contain the new building of St. Paul's. He further proposed to build all the parish churches in such a manner as to be seen at the end of every vista of houses. By the water-side, from London Bridge to the Temple, he had planned a long and commodious wharf and jetty, where he designed to have placed all the halls of the various City companies. The principal streets were to have been 90ft., the second-rate streets 60ft., and the lesser streets or alleys not less than 30ft. wide. A canal was to have been cut to Bridewell 120ft. wide. Finally, the Royal

Exchange was to be in the centre of the City, in the middle of a piazza, whence the streets, and so many rays from that centre, were to proceed to all the principal parts of the City.

A MOVEMENT is on foot in Twickenham and other places having for its object the erection of a new bridge across the Thames opposite that town. At present Twickenham is practically deprived of any enjoyment to be derived from walking alongside the Thames, as nearly all the river frontages are in private hands and the Surrey shore opposite can only be reached by means of a ferry. It was proposed at first that a footbridge should be erected similar to the one at Teddington, the cost of which is estimated at about £2500. It was proposed to carry this bridge over Eel Pie Island, where a large hotel is about to be built. Others, however, deemed this a bad measure, holding that what was wanted was a stone bridge for horses and carriages, which would bring Kingston, the only market town in the neighbourhood, a mile and a half nearer to Twickenham than it is at the present time. The movement has now assumed definite shape, as the Twickenham District Council has taken the matter in hand, and has appointed a committee to approach the Middlesex County Council, the Surrey County Council, the Earl of Dysart, and any other authorities or persons concerned, with a view to constructing a carriage-way bridge over the Thames at the point mentioned. Such a bridge, it is believed, would cost about £50,000.

MR. BAZALGETTE, the engineer of the London County Council bridges, who has charge of the work at Millbank, thinks that about a fortnight should now be sufficient to complete the temporary bridge, and to permit of its being opened for traffic. The roadway is now being laid with wooden blocks; there is a good deal of painting to be done; a part of one of the footways is unfinished, and there are various pipes that have yet to be laid along one side of the bridge. But the end of the work is not clearly in sight, and the opening may be expected in about the time mentioned. The other bridge will be at once closed, and the contractors will have instructions to begin its demolition immediately.

At last, after many rumours and mutation the famous Hope collection of Dutch and Flemish pictures from Deepdene—eighty-three canvases—are to change hands. Lord Francis Hope applied to the Court of Chancery for sanction the sale of these famous heirloom in which, under the will of his grandmother, he possesses a life interest. Recently the permission was accorded by Mr. Justice Romer on condition that the sum obtained was not less than £111,000. Tenders for the collection

were received from various art collectors at home and abroad, and it was the other day intimated to his Lordship that Mr. Wertheimer had made an offer of £121,550, which the trustees were willing to accept. Mr. Justice Romer sanctioned the sale.

THIS collection of pictures were, it may be remembered, on exhibition at the South Kensington Museum from 1891 for some time onwards. Among the most celebrated may be mentioned the Rembrandt of "Christ with His Disciples in the storm on the Sea of Galilee," a beautiful Gerard Dou of a girl with poultry at a window, holding up a rabbit; a very fine specimen of that rare master Van Der Neer, which represents "A lady and gentleman in the foreground, and a lady and gentleman at table, waited on by a page." There are also two fine Metsus, one of "A lady reading a letter at a window," and the other, not perhaps so distinguished, of "A gentleman in a black dress writing at an open window." There is a very fine specimen of Wouverman, entitled "Village Merry-Making;" two of Terburg, one of "Soldiers drinking and smoking," and the other of "An officer writing orders;" a beautiful Paul Potter of the usual character; a Jan Steen of a christening, which is interesting as containing a portrait of the painter; and a fine Adrian Van Ostade of "A Cottage Yard."

AN instructive lesson in the artistic tendency of County Council government may be learned by any one who has occasion to pass over Waterloo Bridge. Hitherto, Londoners have been content to accept the manifold discomforts of that narrow and wind-swept thoroughfare, because the bridge as a specimen of architectural engineering is held to be a credit to the metropolis. This opinion, says the *Globe*, has been taken largely upon trust: because those who use the bridge are compelled in dry weather to keep their eyes shut to escape the whirling dust, and when it is wet have to devote their first and best thoughts to dodging the mud thrown up by whirling hansom wheels. But these discomforts have been accepted, because the bridge is understood to represent a high-water mark of British Art, with the artistic severity of its solid granite proportions well maintained in the classic outlines of the iron standards which supported its not-too-frequent lamps.

THE London County Council has, however, decreed that the bridge shall henceforth be lighted with electricity, and to this end has caused to be erected a number of iron posts which are not only out of keeping with the architecture of the bridge, but are so positively mean in appearance that an enterprising publican would hardly erect such things around its premises. In order to put them up, moreover, niches have been cut in the solid granite of the bridge, with the result of permanent disfigurement of the structure. Such vandalism is unworthy of the greatest city in the world; and we have called attention to it in the hope that when next the London County Council meddles with London's Architecture it may see that its ironmongery has some semblance of appropriateness to its site.

It is important to note the results year by year of the National Competition between the Art schools of the Science and Art Department at South Kensington. The exhibition of the works selected for this year has just been opened at South Kensington, and it shows somewhat conclusively (says the *Globe*) the one-sidedness of the Departmental training. The comments of the examiners are instructive. They lament for the most part deficiencies in just those classes of work where real soundness of system will give the best results. The paintings of the head from life are "very disappointing," designs for pottery, mosaics, stained glass, and tiles are "uninteresting," modelling of foliage from Nature shows little improvement, and so on. Against this can only be set off an advance in work where knowledge of conventions is at least as important as power of observation; in

wall-paper designing, in pattern making for laces and embroidery, in metal work, and studies of anatomy.

THE meaning of all this is simply that under the present system students are led less to develop true originality than to study and imitate accepted authorities. They are being taught to depend upon tradition, and are given no encouragement to use their inventive capacities. The whole principle is a wrong one, and is based upon the delusion that a man may be made an efficient designer without having learned to be an artist. It defeats its own end, and makes the building up of a great and active national school almost impossible, for what it is busy in producing is not an array of Art leaders, but a collection of more or less efficient journeymen only fit to work under orders.

AN interesting correspondence has taken place between Mr. Richard Lees, the hon. secretary of the Sir Walter Scott Memorial in Westminster, and the United States Ambassador. On May 7th last, at a meeting of the memorial association, Sir Theodore Martin proposed, and Mr. Murray seconded, a resolution, which was unanimously carried, that "If the surplus funds suffice to obtain a replica of the bust of Sir Walter Scott, which is proposed to be placed in Westminster Abbey, Mr. Hutchinson be requested to make such copy, and that it be presented to the Boston Public Library as some recognition of the ready and cordial help which the citizens of the United States have rendered to the committee." Mr. Lees was requested to communicate the offer to the American Ambassador, with a view to its reaching the proper quarter. Mr. Hay has recently received the following reply from Mr. Josiah Quincy, the Mayor of Boston, dated July 6th:—"Dear Sir,—Pardon my delay in acknowledging your letter of May 16th enclosing a letter from Mr. Richard Lees, hon. secretary of the Sir Walter Scott Memorial Association. Owing to the absence during the summer of some of the Public Library trustees I cannot at this moment have a meeting of the Board to act formally upon the offer of the association, but I feel entirely warranted in saying that the proposed gift will be gratefully accepted by the City of Boston to be placed in the public library. I desire to express, on behalf of the City, my appreciation of this gift, and of the friendly spirit which inspires it, and my gratification that our public library should have been selected as the repository of this bust of Sir Walter Scott."

A CURIOUS clause, taking one right back to the middle ages, appears in the title-deeds of a house which is now to be sold in the village of Offham, in Kent. Scheduled as part of the "messuages, lands, hereditaments, and premises," is the village quintain, which still swings on its stout oaken post before the house, and the purchaser must covenant to keep the relic of a bygone pastime in good repair. One end of the swinging crossbar of this quintain (said to be the only surviving specimen in England) is shaped like a square target, pierced with a number of holes, into which the point of the player's lance would enter. When struck it would swing round, and unless the player were nimble, the sand-bag hung on the other end of the crossbar would swing round and unseat him. Here is a chance seldom met with in these modern days of getting back into mediævalism.

SOMEBODY, says The Outlook, has stolen General Wolfe, and it isn't the first time either. There was a quaint old wooden statue of the General on a house at the corner of Palace and St. John Streets, Quebec, and this statue has for the second time disappeared. Nobody, it is true, missed it till some United States tourists, failing to find an object they had journeyed many miles to see, made inquiries. Meanwhile Quebec is one Wolfe statue the less. Seventy odd years ago the same statue was carried off by a number of British middies out for a lark. They took it

away with them to the West Indies, and it was only when a United States tourist came to Quebec and made inquiries that the statue was returned.

THE unveiling of the statue of Alain Chartier at Bayeux has taken place within the last few days. Chartier was a famous writer in the fifteenth century, and his "*Livre des Quatre Dames*," written shortly after Agincourt, is a French classic. He was a patriot and a democrat, but his "eternal glory," as M. Geruzez says, was "to have announced the mission of Jeanne d'Arc." The monument is the work of M. Tony-Noël and A. J. Le Duc. It has been placed at the corner of the Rue du Général de Bois, in a small open place, where it finds itself in a congenial framework of deliciously antique houses. The poet is represented in an attitude of patriotic inspiration. He is reading some eloquent harangue, and the whole effect produced by the work is undeniably stimulating.

THERE was never any doubt that if the new system of deep-level railways, worked by electric power, proved successful, it was destined to be very largely developed. That prospect is now in process of being rapidly fulfilled. The City and South London line, which was the first to be opened, has been followed by the line from Waterloo to the City under the Thames, and the longest line hitherto projected—from the Bank to Shepherd's Bush—is approaching completion. We now hear of another scheme—a line from Waterloo to Baker Street, for which the preliminary surveys are being made. This is to pass under the river to Charing Cross, where it will connect with the District Railway, and be continued by way of Regent Street, with stations at Piccadilly Circus and Oxford Circus, finally joining the Metropolitan line at Baker Street.

THE Lord Dean of Guild has issued an interlocutor in connection with the application of the trustees of James Kirkland for a warrant to erect an eight-story building on the south side of Waterloo Street, Glasgow. Some time ago, when the plans came before the Court, the Lord Dean of Guild referred to the great height of the building—over 100ft.—and to the risk to the public and to the co-terminus properties should fire occur therein, particularly as the Master of Works pointed out that water would not rise to such a height. Latterly the neighbouring proprietors on the east and west, who hold their properties from the same superior, lodged written objections, on the ground that the titles provided that the houses or buildings to be erected on the said ground should not exceed in height four square stories above the streets, and that the walls of the house so far fronting Waterloo Street should not be more than 52ft. in height. They contended that the buildings proposed to be erected, being in violation of these restrictions, and being prejudicial to their properties, the lining should be refused. The Dean of Guild Court find that the objectors have no title to enforce the restrictions as to the height of the buildings to be erected, and therefore repels the objections, and grants warrant as craved.

THE sixty-seventh anniversary of the opening of London Bridge by King William IV., in 1831, occurred a few days ago. Of the hundred thousand pedestrians who pass over it every day, how many are aware that the lamp-posts were cast from the metal of French cannon captured in the Peninsular War? Such, however, is the fact; it therefore, like Waterloo Bridge, commemorates the victories of Wellington and his troops. It may be worth while, perhaps, to mention that the old London Bridge, which stood a little east of the new structure, and in a line with Fish Street Hill, was not pulled down until 1832, having served its purpose for over six hundred years. It had in that time undergone many alterations. The houses which originally stood on it were burnt down in the Great Fire. Some of them only were subsequently rebuilt, and these were demolished to afford convenience to the traffic.

NATIONAL ASSOCIATION OF MASTER BUILDERS.

A MEETING IN LEICESTER.

THE National Association of Master Builders of Great Britain has held its half-yearly meeting at Leicester within the past few days, under the chairmanship of the president of the association, Mr. T. Stephenson Jones, of Liverpool. The council meeting was held previously, when routine and special business was transacted. About eighty delegates were present at the general meeting, when the scheme for the federation of districts was discussed and adopted. It was decided to hold the next half-yearly meeting at Bradford. In the evening a complimentary banquet to the association was held. Mr. George Hardington, the president of the Leicester Master Builders' Association, filled the chair, and the company present included the president of the association (Mr. Stephenson Jones), the Mayor of Leicester (Ald. Wakerley), Sir Israel Hart, Sir Thomas Wright, Ald. the Right Hon. J. M. Meade, P.C. (Dublin), Ald. Sawday (president of the Leicester Society of Architects), Mr. E. G. Mawbey (borough surveyor). The gathering numbering

ABOUT 130 MASTER BUILDERS

from all parts of the United Kingdom. The loyal toasts having been duly honoured, Councillor Henry Green (Northampton) gave the toast of the "Municipality and Town and Trade of Leicester."—The Mayor, Sir Israel Hart, responded.—Mr. G. Hewitt gave the "Architects, Engineers, and Surveyors," saying the object of the borough was to ensure sound and honourable friendship between tradesmen and the profession.—Ald. Sawday and Mr. E. G. Mawbey responded to the toast, and spoke of the friendly relations existing in the town between architects and builders.—Sir Thomas Wright proposed the toast of the evening—viz., "The National Association of Master Builders of Great Britain." He spoke of the necessity of the association obtaining Parliamentary assistance in connection with matters relating to the building trade when necessary, and remarked upon the importance of their dealing with the labour question in general. He trusted that the association would go on and prosper.—The President, in reply, alluded to the fact that

THE BUILDING INDUSTRY WAS THE LARGEST in the country, and paid something like sixty millions a year in wages. One in every seven of the working population of the country belonged to the trade. He thought that employers in this vast industry were indebted to the National Association for the work it had done on their behalf during the past twenty years in labour questions and matters affecting the trade. He commented upon the advantages of federation, whereby local and county trade disputes might be made national.—The toast of the local association was proposed by Mr. T. F. Ryder, F.R.G.S. (London), and responded to by Mr. Hardington, who said eight years ago it was found necessary to reform the Leicester Association. The object of their association was not to take up an aggressive attitude, but to maintain the right of those who had the responsibilities of building in Leicester.

The North Riding County Council has authorised its Standing Joint Committee to obtain plans and estimates for obtaining the necessary offices adjacent to the present court-house.

FLEET STREET improvements are likely to sweep away another old landmark, in the shape of the establishment of Messrs. Butterworth and Co., law book publishers, hard by Middle Temple Lane.

BUILDING is now progressing on the vacant ground in Fetter Lane and West Harding Street. Premises are being built by Mr. Fortescue after the plans and designs of Mr. H. H. Collins. The architect of the block of shops and offices at the opposite corner is Mr. R. M. Roe.

London School Board Buildings.

THE annual report of the Works Committee of the London School Board, which has recently been issued, gives an abstract of the work done during the year ended March 25th, and shows the progress made in the provision of accommodation which has been sanctioned by the Board and the Education Department. The report, after stating what action has been taken with regard to the purchase of twelve sites for new schools and additional land for nineteen existing schools, with regard to which compulsory powers were obtained in 1896-97, sets forth

A LIST OF SITES

for twelve new schools and for enlarging schools or playgrounds or for general improvements. During the past year the Board agreed to purchase various interests in sites at a cost of £84,361, the surveyors' fees amounting to £583, and, including these amounts, the total cost of the sites purchased up to the end of the year under review was £83,300,165, the surveyors' fees, &c., being £446,931. According to a table prepared by the finance department, the cost of the sites for 350 schools, the accounts of which had been completed on September 29th last, was £6 14s. 6d. per child, and the average cost per head for school buildings was £13 14s. 1d., and for furniture and fittings 10s. 7d. Up to Lady Day, 1897, the total

NUMBER OF PERMANENT SCHOOLS

which had been erected and opened was 418, and during the year under review twelve new schools and eight enlargements were opened. The twelve new schools opened were—one in Chelsea, one in Finsbury, one in Greenwich, three in Hackney, one in East Lambeth, four in West Lambeth, and one in Tower Hamlets. The total accommodation thus provided was for 12,948 children, and the cost of the sites, buildings, and furniture was £352,484 16s. 7d., or an average cost per head of £27 4s. 5d. The enlargements were carried out in Finsbury, Greenwich, West Lambeth, Southwark, and Tower Hamlets, and provided additional accommodation for 2910 children, at a cost (exclusive of site) of £83,146, or an average cost per head of £28 11s. 5d. Loans were authorized by the Education Department in respect of the twelve new schools amounting to £364,668, and on account of the eight enlargements and sites amounting to £138,278.

ADDITIONAL SCHOOL PROVISION

has been made to the following extent:—Tenders have been accepted during the year for erecting nine new schools to provide accommodation for 7719, and for carrying out thirteen enlargements of schools to provide accommodation for 3863 children. The new schools will be erected—two in Greenwich, one in Hackney, two in East Lambeth, two in West Lambeth, and two in the Tower Hamlets—at a total cost of £173,305, or £22 9s. per head. The enlargements will be made—two in Finsbury, four in Greenwich, one in Hackney, one in West Lambeth, three in Southwark, and two in the Tower Hamlets—at a total cost of £91,702, or £23 14s. 9d. per head. The tenders include the provision of halls which are not counted in the accommodation of the schools, the provision of centres, and in all cases a drawing class room. In four cases a playground is being provided on the roof. Three of the schools are being erected under the special arrangements made with the view of reducing the cost. With regard to the enlargements, the variations in cost arise mainly from the fact that the opportunity is taken to improve the existing schools by providing halls, &c., so as to make them thoroughly efficient. Tenders have also been accepted for erecting or providing, among various other works, fourteen cookery centres, seventeen laundry centres, sixteen manual training centres, seven schools for special instruction, rooms for the teaching of the upper standards at nine schools, a blind centre, two housewifery centres, draining and other works at nineteen schools, an infirmary and isolation ward in connection with the Shaftesbury Training

Ship, at a cost of £3400. Sanitary works have also to be carried out at twenty-one schools, and the total amount of the tenders accepted in respect of seventeen of these schools is £23,115. The system of carrying out

REPAIRS TO SCHOOL BUILDINGS

by workmen employed direct by the Board is being continued in nine of the eighteen districts of the Clerks of Works for repairs. At Lady Day last the following work was in hand:—Fifteen schools were in course of erection, providing accommodation for 13,789 children, and fourteen enlargements, giving accommodation for 4467; thirty-two additional sites for new schools had been or were being purchased, the schools to be erected on twenty-five of which would provide for 23,157 children; twelve sites for new schools had been scheduled, the schools to be erected on four of which would provide for 3494 children; eighteen enlargements of schools had been sanctioned by the Education Department, providing for 5840 children; and the Education Department had sanctioned the provision of sites in seven districts, which would be scheduled next session, the schools to be erected on four of which would provide for 2820 children.

ROMAN REMAINS AT CIRENCESTER.

THE last excursion of the Birmingham Archaeological Society for the present season took place at Cirencester. The church is one of the most interesting in Gloucestershire. Here are important remains of Norman and Early English architecture, and the base of one pillar is distinctly Roman, having, doubtless, been taken from one of the noble edifices with which Corinium was adorned. The bulk of the church is, however, a fine example of the Decorated style, the body, which is lofty and almost square, conveying a marked impression of space, light, and dignity. What restoration has been effected has been careful and reverent, and while the ancient stained glass is admirable, the more modern windows do not compare with it unfavourably. The ancient brasses are great in number and in interest, and the pulpit is a remarkable example of light and elegant stonework. The most singular and beautiful feature of the church is the two-storied porch or parvis, the original subject of which is doubtful, but which has certainly been for some four centuries the pride of Cirencester. The visitors were permitted to inspect the extremely fine museum of Roman remains collected by Mr. Wilfred Cripps. Outside the museum is the fine capital of one of the columns of the Basilica, a building proved by the recent excavations of Mr. Cripps to have been not less than 300ft. in length and of great dignity. The mosaic pavement preserved *in situ* on the outskirts of Oakley Park was next visited, and after a short glimpse of Earl Bathurst's park, the museum built by a former Earl Bathurst for the public preservation of Roman remains was reached. Here are two Roman mosaic pavements, one of them well known as amongst the best and most perfect of its kind in England. There are also valuable Roman tombstones and relics of every kind. Of the Abbey almost nothing now exists except a Norman gateway, which was seen, possessing on the inner side a window through which doles were distributed, and still retaining its glazing of horn instead of glass.

THE success of the small edition of Mr. Ruskin's chief works has been so great that Mr. George Allen is preparing a cheap edition of "Preterita."

MR. SMALL'S monograph on "Scottish Woodwork of the Sixteenth and Seventeenth Centuries" is to be reissued; but, unfortunately, the full-size plates will be reduced one-half in the new edition.

AT Alderman's Green, near Coventry, foundation stones have been laid of a new Free Methodist chapel, to supersede a building erected about forty years ago. It will be of red brick, relieved by Bath stone dressings, and will accommodate some 320 persons.

Professional Items.

BIRMINGHAM.—Considerable improvements have been made at the Birmingham Theatre Royal. Mr. Frank J. Bill, of London, is the architect, and the work of carrying out his designs has been entrusted to Mr. John Taylor. The seating has been re-upholstered in the circles and stalls. The old papering of the circles, which had grown somewhat dingy with the lapse of time, has been replaced with a pleasing turquoise blue. The painting of the lining has been revived and cleaned; the building of the circle fronts has been picked out with gold, and the old papering at the back of the pit has given place to a rich and softly vermilion.

CLEETHORPE.—The Warwick's Revolving Towers Company has completed arrangements with the Great Central Railway Company for the erection of an observation tower on the promenade, to the west of the railway station Cleethorpe. The tower is to be 155ft. high, and will have a car revolving around it adapted for seating 200 passengers. A pavilion is to be built at the base. The work will be commenced in October, and completed by the following Easter.

DEVONPORT.—St. Aubyn Church, Devonport, has just undergone restoration. The west gable of the church has been removed, and the side galleries continued to the west end. The church has been re-roofed with a concrete and wood-block floor, and the outside of the church has been trenched and drained. The seats have been removed, and chairs substituted. Two new heating stoves have been provided. The church has been relighted with gas chandeliers and brackets, and recoloured and decorated throughout.

GLASGOW.—Highly satisfactory progress continues to be made with the reconstruction of Glasgow Bridge. The first five arches from Jamacia Street end are completed, and the sixth is expected to be finished ten days hence. There will then only be one more arch to build, and as a week or so will see all the iron work of the piers above high-water complete, an immediate start will be made on the final heavy part of the undertaking. Present the workmen are chiefly engaged in laying iron troughs beneath what will be pavement. Upon these arched troughs will be laid heavy gas and water cast-iron pipes. The advantages of this plan are many. In case of a gas leakage or burst water main, the pipes will be very easily got at, and without the slightest detention of vehicular traffic. The pipes lying on these troughs will also be easily preserved. A very substantial job is being made of the filling in of the spandrels, the very best cement being used in the concrete. All the material for the seventh arch is ready for placing, and nearly all the granite for the finishing of the bridge is at hand near by. If nothing unforeseen occurs, the structure is expected to be out of the contractor's hands just about the estimated time—early in spring.

HANDSWORTH.—A memorial window to the late Mrs. H. S. Richards, in the chancel of the Holy Trinity Memorial Church, Handsworth, was dedicated on Sunday week. The subject of the effigiation occupies the three centre lights, the figure of Jesus as the Good Shepherd in the True Vine the outermost lights, under the influence of sixteenth century treatment, to harmonise with the stonework. The window was designed and executed by Mr. T. W. W. of the Studio, Smethwick. The chancel is being decorated from Mr. Camm's designs.

INVERNESS.—The Building Committee of the Parish Council of Inverness recently decided of the plans prepared by Mr. James Reid, architect, High Street, for the conversion of an old building in Bank Street into offices for the purposes of the Council. The following have been the contractors:—

Mason, Alexander Fraser; carpenter, Robert Munro; slater, Adam Taylor; plumbers, Noble and Burgess; plasterer, Alexander Fraser; painter, James Cameron—all of Inverness.

KEIGHLEY.—The contracts for the extension of the Keighley and District Hospital have been let as follows:—Masonry, Mr. M. Booth, Clayton; joinery, Messrs. Foster and Fortune, Ingrow; plumbing, Mr. Jos. Harrison, Keighley; plastering, Mr. Jos. King, Keighley; painting, Mr. F. Petty, Keighley. These contracts represent a total of a little over £14,000, and it is expected that heating will represent £2000 more.

KENTON.—The parish church of Kenton, near Exeter, has been enriched by the decoration of the chancel and east walls. The decoration on the latter consists of kneeling groups of angels in the attitude of adoration beneath the Paschal Lamb, whilst on the north and south walls of the chancel are the figures of the Four Evangelists and SS. Peter and Paul, in life size, beneath conventional canopies, and standing upon bases illuminated with their emblems and texts applicable to each figure. The remainder of the work consists of highly-ornamental conventional details, among which a continually recurring series of heraldic badges of the Courtenay family is prominent. The work was executed by Messrs. F. Drake and Sons, Exeter, from designs by Mr. Bligh Bond, of Bristol.

LOW FELL.—New buildings have been erected at Low Fell by the Provincial Laundries Limited. In the main front of the building is the public entrance, giving access to the clerks' offices, adjoining which is the private office of the manageress. On the right-hand side of the offices is the sorting-room, where all the goods to be dealt with are received and classified. Immediately behind this is the van-dock and the large hall, where customers' baskets can be stored. Beyond this is the washhouse, fitted with all the latest appliances in the way of washing machinery. Beyond the washhouse are the engine-room and drying-room, the latter being fitted with two powerful fans. Parallel with the washhouse is the large ironing-room, and coming back towards the office is the packing-room. The various departments are so grouped round the offices that the maximum amount of supervision can be obtained. On the first floor, over the front block, there are a mess-room for the people employed, and a large store-room and a large spare-room for the extension of any of the branches of work taken by the laundry. Outside the main block are the boiler-house, carpet-beating room, stabling for six horses, harness-room and hay-loft, a large-covered van-shed, and two commodious cottages for the engineer and vanman. The buildings have been carried out with Birtley bricks with pressed brick mouldings and arches, the upper part of the walls being rough-cast. The contractor for the building was Mr. J. C. Hope, and Mr. Mackay acted as inspector, and the whole of the works have been carried out from the designs and under the superintendence of Messrs. Oliver and Leeson, architects, of Newcastle-on-Tyne.

MARGATE.—The new Grand Theatre at Margate was opened on Monday week. The building is situated in Cecil Square and Cecil Street, the principal entrance being in the latter. The imposing looking building, which has undergone many external and internal alterations, was, till recently, the Royal Assembly Rooms, and occupies part of the site of the old historic rooms which were so popular for concerts and dancing for a century or more. Sitting accommodation has been provided for 1800 persons, and on Monday night all seats were occupied. The decorations are in gold and light blue, and the mosaic ceiling is similarly ornamented. From all parts an uninterrupted view of the stage, which is 60ft. wide by 40ft. deep, can be obtained. The decoration and seating are by Mr. Dean (Birmingham). Mr. Hope was the architect, and Mr. Davidson the contractor.

MORECAMBE.—The erection of a cottage hospital for Morecambe will shortly be proceeded with. At a meeting of the Diamond Jubilee committee several tenders were recommended for acceptance by the building committee, these amounting in all to £1900 14s. To this sum, however, the chairman explained, must be added the cost of the furnishing, which would bring the total cost to £2500.

MORRISTON.—At the Graig, Morriston, eleven stones, to commemorate the erection of a new Welsh Congregational Chapel, have been laid. The new building is to be erected with the best native stone dressings, the front and gable returns being best-class shoddie work, and the sides and back of best hammer-dressed work. There is to be an entrance lobby, an octagonal gallery, and the whole of the interior woodwork is to be of best pitch-pine. The contract has been let to Messrs. Walter and John, Morriston, and Mr. W. W. Williams is the architect.

STAINES.—The Parish Church of St. Mary, Staines, was reopened by the Bishop of London on Sunday week, after extensive internal alterations, consisting mainly of the substitution of an open timber roof for the old plaster ceiling, a new tile floor for stone flags, and open seats for the old-fashioned high pews. A new stained-glass window has also been provided at the east end of the nave above the chancel arch.

THORNHILL.—A new school is about to be erected at Thornhill, about half way between Partick and Whiteinch, on a slope overlooking the Clyde. The proposed buildings will form a square, to be surrounded by four new streets which have not yet been finished. Accommodation will be provided for 1332 scholars, and the estimated cost of the entire buildings is £18,000.

WEST HAM.—The foundation-stone of an asylum for the County Borough of West Ham, population about 260,000, was laid at Chadwell Heath, Essex, on the 3rd inst. The asylum is designed for the reception of 800 patients in various blocks. The administration block is placed centrally, the front portion being occupied on the ground floor by the chief medical officer's, steward's, and clerk's offices, board room, dispensary, library, &c.; the museum and laboratories and assistant medical officer's rooms being on the first floor. At the back are the waiting room, matron's apartments, recreation hall, rooms for male and female attendants, kitchen, bakery, general stores, laundry, boiler, engine house, and workshops, &c. The main buildings will be two stories in height, and will occupy an area of about ten acres, with 90 acres of surrounding land. The foundations have been put in by Messrs. Gregar and Son, of Stratford, at a cost of about £16,000. Messrs. Leslie and Co., of Kensington, have the contract for the superstructure, £210,000. In addition to the main buildings there will be a medical officer's residence, also steward's chief attendants' and married attendants' houses, isolation block, mortuary, lodges, and a chapel to accommodate 550 adults. The total cost when finished will be about £300,000. The architect is Mr. Lewis Angell, F.R.I.B.A., the Borough Engineer of West Ham.

DESIGNS for the new railway station to be erected at Stockholm will be received up to Wednesday, 31st inst., at the offices of the Consulate, 27, Great Winchester Street.

THE execution of the Martyrs' Memorial which is to be erected at Canterbury has been intrusted to Messrs. J. Whitehead and Sons, Limited, Westminster and Aberdeen. This firm is also executing the Martyrs' Memorial which is to be erected at Lewes.

THE following buildings have been reported to the Common Council as dangerous structures: 12, Ropemaker Street; 1 and 2, Blackley Street, and 67, Fann Street (one building); 85, Fenchurch Street; 87, Fetter Lane (south side); and 34 and 35, Monkwell Street (cornices).

The following are a few of the Press Opinions upon

THE R.I.B.A. EXAMINATIONS AGAIN.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In your reply to "Student" in your June 1st issue, you deprecate the use of many books on Practical Plane Solid Geometry. Can you suggest the best means of obtaining a sufficient knowledge of the subject to meet the requirements of the Intermediate Examination? I believe there are cardboard models to aid the illustrations of the text-books, but I have been unable to procure these so far. Your information would greatly oblige—Yours faithfully,

H. E. B.

In our issue of June 1st we referred to Plane Geometry only. However, we are of opinion that the same remarks hold good with reference to Solid and Descriptive Geometry. We think the right way is just to master the elements of the subject, theoretically, as set out in Euclid, Book XI. (for example), or in such treatises as Drew's "Conic Sections." To go to some book on Practical Geometry in order to acquire certain facts, simply for the purpose of passing an examination, is a proceeding we could not recommend to anyone; it is no education. But if this is what you intend to do, perhaps "Practical Geometry," by John Carroll (Burns and Oates), may serve your purpose. With regard to models, their real use is when you make them yourself, as actual demonstrations of the correctness of your work, and as aids to realising what you are doing. If, for instance, you draw out the different faces of a voussoir stone, at the intersection of two barrel vaults, and then cut out each template in thin cardboard, or paper, and stick them together, you soon find out whether you are right.

Correspondence.

ARCHITECTS IN SOUTH AFRICA.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your versatile contributor, writing yesterday under the heading of "Bricks and Mortar," takes exception to the very common practice, in the Colonies, of professional men advertising in the daily papers. He quotes one by Mr. F. Upton, of Church Street, Pietermaritzburg, evidently thinking the advertisement an oddity in its way. I have spent the greater part of this year in a holiday scamper through the five great colonies of South Africa, and can assure him and your readers I have never seen a Colonial newspaper in that Continent that did not contain advertisements inserted by architects, physicians, and solicitors. Here, for instance, are some architectural samples taken, haphazard, from the columns of the Matabele Times for Tuesday, 5th July, 1898, just to hand by the incoming mail:—

NEWTON & MITCHELSON,

ARCHITECTS & CIVIL ENGINEERS.

Glass's Chambers, Bulawayo, and at Gwelo.
P.O. Box 107.

HENRY E. HUGHES,

ARCHITECT,

(Late POWER & HUGHES, London.)

Partridge Chambers, Main Street.
Box 175.

W. DOUSLIN, M.P.E.F.,

ARCHITECT.

For 20 years Architect to the Education
Department of Marlborough, New Zealand.

OFFICES: OPP. POST OFFICE.

BENZIE & DEEBLE, M.S.A.,

ARCHITECTS & CIVIL ENGINEERS,

12, Exchange Buildings, Bulawayo.

Again, the Bulawayo Chronicle for the same date contains many other examples, and all the architects concerned are more or less really good men, as Colonial architects go.—Yours obediently,

HARRY HEMS.

Fair Park, Exeter, Aug. 4, 1898.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABINGDON.—For the erection of three houses, Albert Park, for the Governors of Christ's Hospital. Mr. J. G. T. West, architect, The Knowl, Abingdon:—
Ward and Son .. £1,379 18 8 Grant £1,159 0 0
Bottrell and Son .. 1,239 0 0 Ricketts 1,036 0 0
Buckle .. 1,220 0 0 Randall 890 0 0

ALLOA (N.B.).—For the formation of roadway, &c., Ashley-terrace, Sunnyside, for the Right Hon. the Earl of Mar and Kellie. Mr. A. P. Forrester Paton, and the Alloa Co-operative Society Limited. Mr. G. A. Kerr, engineer and architect, 37, Mill-street, Alloa. Quantities by the engineer:—
R. Gall £995 3 9 G. and R. Cousin,
A. Gall 825 10 10 Alloa* £705 17 5

Plastering.—J. Walsh, Armley 48 10
Plumbing.—A. B. Cronack, Armley 42 0
Painting.—C. F. Brown, Armley 10 10

BARTON STACEY (Hants).—For the erection of three cottages, for Mrs. McCreagh Thornhill. Mr. A. Purkess, architect, Andover:—
F. Beale £729 0 C. Grace and Sons .. £657 0
H. Annett and Son .. 725 0 S. Bell, Andover* .. 610 0
C. Simkins .. 1 11 11 * Accepted.

BRIGHTON.—For alterations, &c., to school, Preston-road, for the Brighton and Preston School Board (U.D.). Messrs. T. Simpson and Son, surveyors, 16, Ship-street, Brighton:—
James Barnes £744 W. Brown and Son .. £679
G. R. Lockyer 710 Sattin and Evershed .. 647

BUCKLOW.—For the construction of main sewers and outfall works, Hale, for the Rural District Council. Mr. J. M. D. McKenzie, surveyor, 7, Market-street, Altrincham. Quantities by surveyor:—
James Hamilton and Sons, Altrincham .. £1,565
Eight firms tendered. Lowest accepted.

CHARTHAM.—For painting Kent County Lunatic Asylum externally. Section No. 2. Mr. W. J. Jennings, architect, Canterbury. Quantities supplied:—
W. F. Hadlow £1,080 A. H. Inns, Watford* .. £995
Emery Bros. .. 1,025 * Accepted.

CHELMSFORD.—For erecting a small house on the Baddon-road. Mr. Rd. Mawhood, architect, 2, Market-road, Chelmsford:—
F. Johnson £519 W. Fincham £447
J. Gowers 475 W. Samms (accepted) .. 435
[All of Chelmsford.]

CRUMLIN (Mon.).—For additions to Board schools, for the Mynddylwyn School Board. Messrs. Rosser and Roberts, architects, Abercarn. Quantities by architect:—
Rowland and Lloyd .. £421 Lawson and Co. .. £340
D. Lewis 380 C. F. Morgan, New-
E. Williams 343 bridge, Mon. (accepted) 314

DORCHESTER.—For the erection of almshouses for four married couples, for the Trustees of Chubb's and Whetstone's charities. Mr. A. L. T. Tilley, architect, Dorchester:—
E. Smith £1,185 O. A. Harvey, Char-
W. Fry 1,169 15 minster* .. 1,141 0
C. E. Slade .. 1,150 0 * Accepted.

DUNMOW (Essex).—For additions to schools at the Congregational Church. Mr. C. Pertwee, architect, Bank-chambers, Chelmsford:—
Ernest West £379 0 J. Pepper, Dunmow,
F. Harman 305 10 Essex* £232 0
A. M. Warren .. 250 0 * Accepted.

EXETER.—Accepted for the erection of shop and house, for Mr. Plucknett. Mr. J. A. Lucas, architect, Guildhall-chambers, Exeter:—
General Builders, Ltd., Progress Works, Nott-
ing Hill £517

EXETER.—Accepted for alterations and additions to Church Schools, Heavitree. Mr. E. H. Harbottle, architect, County-chambers, Exeter:—
General Builders, Ltd., Progress Works, Nott-
ing Hill £265

LEIGH (Lancs.).—For the erection of banking premises, Bridge-street. Mr. J. H. Stephens (Banks, Fairclough, and Stephen), architect, Leigh, Lancs. Quantities by architect:—
J. W. Cowburn £2,886 J. H. Wright, Leigh,
Lancs. (accepted) .. £2,690
Architect's estimate, £2,688.

LONDON.—For building new projections, to contain additional lavatory and water-closet accommodation at the Strand Workhouse, Edmonton, for the Guardians of the Strand Union. Messrs. W. S. Cross and Kekwick, architects, 18, Outer Temple, Strand. Quantities by Mr. W. T. Farthing:—
Allan and Stanley .. £5,925 Merredew and Wort .. £5,409
W. Lawrence 5,730 T. G. Sharphington .. 5,368

LONDON.—For additions, &c., to Chapel, St. John's-square, Clerkenwell, for the Rev. J. E. Wakerley, and others. Mr. A. Wakerley, architect, 14, Market-place, Leicester. Quantities by Messrs. Corderoy, Selby, and Corderoy, Westminster:—
Stapleton and Sons .. £10,289 E. Houghton and Son £8,751
Barrett and Power .. 9,734 Harris, Ward, and Co. 8,337
Geo. Munday & Sons 9,480 General Builders, Ltd. 8,000
B. E. Nightingale .. 9,407 Merredew and Wort .. 7,900
J. Cheeseman & Sons 9,320 W. Reason 7,859
Holloway Bros. 9,235

LONDON.—For internal painting, &c., at the Infirmary, Wandsworth, for the Clapham Union Guardians:—
G. W. Street £1,482 W. Johnson and Co. .. £895
H. Roffey 1,070 H. Heather (accepted) .. 768
Arthur H. Inns .. 975 F. W. Harris 765
C. Gurling 946 D. McNeil 690

LONDON.—For building villa, Catford Bridge, for Mr. H. Burrows. Mr. W. Woodward, architect, Bedford-row, W.:—
Balaam Bros. £1,400 Layard £898
Simpson and Cove .. 990 W. Dean 750

OXFORD.—For the erection of a house and stabling on the Banbury-road, Oxford, for J. E. Embling, Esq. Mr. Herbert Quinton, architect and surveyor, 15, Magdalen-street, Oxford:—
Wilkins Bros. £2,368 Organ Bros.* £2,543
Bruckers 2,368 * Accepted.

PORT TALBOT (Wales).—For the erection of caretaker's house, at the intermediate school. Mr. Frank B. Smith, architect, Port Talbot:—
Evan Thomas .. £563 0 0 Matthews and Co. £435 0 0
S. Rees 535 0 0 Morgan Coe 420 0 0
Leverton Bros. .. 494 9 0 John Davies, Aber-
Stephens and Co. 459 15 6 avon (accepted) .. 420 0 0

SALTASH (Cornwall).—Accepted for the erection of a Wesleyan schoolroom, and renovation of chapel, at Forder, for the trustees. Mr. Edgar M. Leest, architect, Devonport and Saltash:—
R. J. Taylor and Co., Mutton £312

WEMBLEY (London).—For the erection of new south aisle, organ chamber and porch, and alterations to St. John's Church. Mr. Hayward Brakspear, architect:—
F. G. Minter £3,965 John Bentley £3,330
Dove Bros. 3,750 Belham and Co. .. 3,191
H. Haynes 3,590

WHITBY.—For the erection of villa residence, Goathland. Mr. E. H. Smales, architect, 5, Flowergate, Whitby:—
John Brough .. £1,105 17 6 Robinson Harland,
A. Palfreman .. 1,082 15 0 Whitby (accepted) £1,066 0
John Hutchinson .. 1,078 0 0 C. Winterburn .. 960 0

WHITEHAVEN.—For additions, &c., to Board schools, Arleedon. Mr. J. S. Moffat, architect, 53, Church-street, Whitehaven:—
Chapple and Son .. £608 10 J. Green, Pardshaw* £606 10
* Accepted.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

GAS-WORKS MACHINERY.*

By EDWARD ALFRED HARMAN, C.E.,
Gas Engineer to the Huddersfield Corporation.

(Continued from page xc., Vol. vii.)

COKE BREAKERS.

FOR many purposes coke is required of a small size, and breakers are now extensively used. Formerly the breaking was done by smashing the coke up with a block, or even with the back of a shovel. The smashing of coke in this way involved a serious loss of material. A good form of coke breaker consists of a series of steel circular toothed discs for cutting the coke. The screening is now accomplished by machinery, and where power is not employed, there is generally a rotary hand-screen used, which answers the same purpose on a smaller scale. By this means hand-sieving and riddling are being superseded. The author witnessed, a few years since, this hand-riddling being undertaken by a number of women. Thanks to the progress of civilisation, that is altogether a matter of history. The dusty employment of hand-riddling is most objectionable to plant on the works, so that any apparatus to do this class of work mechanically is a distinct gain.

GAS ENGINES AND TRAMCAR MOTORS.

Gas engines and tramcar motors may be, perhaps, regarded as being outside the range of gas-works machinery, inasmuch as, generally speaking, they are not used in the course of gas manufacture, although there are works where some of them are. It is, however, a distinct branch of gas engineering, and the use of gas for propelling tramcars has received a great impetus by the success of the Blackpool, Lytham, and St. Anne's tramway of about eight miles. Gas engines are now made as large as 200 or 300 horse-power, although the smaller sizes are most generally in use.

FURNACES.

Great advances have been made in economising fuel for retort furnaces, with the use of regenerative settings, largely by the use of hot coke in lieu of cold coke or coal. In some works also tar and oil are being used for fuel purposes, but it is obviously unsuitable in towns where stringent smoke restrictions are in force. In all large works the retorts are heated by a system of regenerative furnaces, so that there is little difficulty in obtaining suitable heats for carbonising the coal. At a gas works visited by the author a few years since, he was informed that all the coke made was required for heating the furnaces, and in addition, a small quantity of coal. It is now customary to reckon from 12 to 15 per cent. of the coal carbonised only as being required for fuel, or say 23 per cent. of the coke made, the balance being available for sale. But there still remains much to be done in the matter of economy of fuel. The refuse clinker and ashes usually carted away to the tip contain a considerable percentage of combustible matter. The author has seen upon some gas-works open hearths for consuming or reducing the tip refuse, by burning it to as small a bulk as possible. This means a considerable waste of fuel, which will eventually be realised. It is worthy of note that scarcely any advance has been made in gas-fired boilers.

LIFTING AND TRAVELLING APPARATUS FOR PURIFIER COVERS AND PURIFYING MATERIAL.

With regard to purifying apparatus, hydraulic-power machinery is increasingly popular. In some cases the huge purifier lids, weighing 10 tons and upwards, are lifted by means of central rams, having the requisite supply pipe to the cylinder running underneath the bottom of the purifiers. In other cases the pipe is connected through the top of the purifier cover. With this central arrangement, the cover remains elevated over the top of the purifier box, during the operations of emptying and refilling with the purifying material. This, in some cases, is undesirable, especially where the purifying material has to be un-

loaded at the sides of the purifier box. In cases where the material is dropped out through openings in the bottom of the purifier box to a celerage below, the objection is not so great. In other cases the purifier lid is externally lifted, and suspended over the purifier box by chains connected to the corners or sides of the covers, according to the design of the framework, the chain being taken up by means of an overhead hydraulic ram. In this case the purifier cover has usually to be travelled upon a huge carriage and suspended over an adjoining purifier. Some very useful forms of lifting apparatus have been designed, operated by manual labour, but this is a slow and tedious process, and cannot be regarded with entire satisfaction. Messrs. John Abbott and Co., of Gateshead-on-Tyne, have made a speciality of hydraulic lifting apparatus of every design, and have erected several of the finest and most satisfactory installations in the world. They have also applied hydraulic power for crane purposes for elevating the purifying material to different floors to many works. Some of the best forms of hydraulic pumping engines, lifting apparatus, and machinery extant are to be found upon gas-works, for various purposes.

SCRUBBERS, VALVES, &C.

In scrubbers and washers there are shafts, gearing, and machinery, either for working the water-distributing gear, or for revolving plates and discs in connection with the apparatus. Many gas valves are elaborate pieces of mechanism. There are also several gas regulating governors, jet photometers, and meters possessing features of interest, although not coming within the scope of this paper.

WASTE.

Mechanical engineering has a splendid field still in gas-works machinery to prevent waste. One item alone demonstrates this. The large quantity of gas wasted when the retorts are open, both during the charging and discharging of them, although enormously reduced by the substitution of machinery and inclined retorts in lieu of hand stoking, still leaves much to be improved. The quantity of spent lime, which is in many towns a waste product, also demands further inquiry as to its adaptability or suitability for any other purpose or process. There can be little doubt that, with the progress of science, what is now termed refuse material will be turned to profitable account. After calcining the spent oxide at the chemical works for the extraction of the sulphur, the huge heaps of material left certainly ought to be further considered. The broken retort material is now being reground by fire goods manufacturers, and need not be carted away to the tip. Considering the quantity of fine dust produced from coke, consisting of the best fuel material, it is somewhat surprising that greater attention has not been given to the manufacture of briquettes. Experiments have been made from time to time by the addition of varying quantities of pitch (some seven or eight per cent.), and other matter to the dust, but nothing very perfect has as yet been extensively adopted. While coal sludge seems to have made greater strides, and with a large amount of success, especially where the fuel has been used for marine purposes, coke dust is regarded as a source of annoyance instead of profit. It has certainly been utilised for asphalt. The waste water from sulphate of ammonia manufacture deserves consideration. It is now passing away to the extent of millions of tons annually, quite hot. The waste of this hot water should be preventable. Water used for quenching coke is allowed to drain away to waste, containing, as it does, many different elements in solution. An enormous quantity of cyanides in coal gas is also being lost, although efforts are now being made to recover it.

RETORT-HOUSE OPERATIONS.

The retort-house is obviously the foundation and commencement of gas-works operations, and specially designed machinery for emptying and filling the retorts first claims consideration. Formerly the larger coal required to be broken was dealt with solely by hand. In

works now, where hand stoking continues, the stoker is provided with a sledge hammer to smash up the large lumps of coal. Where a large quantity of cannel coal was used, it was necessary to employ a gang of men for the purpose, and as it was desirable the percentage of cannel should be continuous, this gang took their turns as regularly as the stokers themselves. Coal breakers are generally and most desirably placed, where circumstances permit, in the coal stores, in brick pits covered by suitable iron framing and floor plates. The breaker is driven by a steam or other engine combined with it, or a separate gas engine may be used for driving the breaker where available. There are several sizes and types of coal and cannel breakers to suit all classes of large and small cannel, as well as the numerous varieties of common coals. The coal may be brought into the coal stores by railway wagons on an overhead railway, or by carts or conveyors.

COAL TRUCKS.

In one of the Birmingham Corporation gas-works, of which the author had the superintendence for several years, specially designed steel hopper wagons (Hunt and Shackelford's patent), with sloping ends and two sliding doors underneath, were placed directly over the top of a hopper supplying the coal breaker, and the contents of a 10-ton truck were emptied directly into the hoppers and coal breakers below. These wagons were first adopted by Mr. Charles Hunt, M.Inst.C.E., at the Windsor Street Works, Birmingham.

COAL ELEVATORS AND CONVEYORS.

When the cannel or coal has been reduced to a suitable size by crushing through the breakers, it falls, together with the smaller pieces which do not require breaking, and the dust, into the bottom of the pit in which the elevator runs. It is then carried up to a large overhead hopper placed in the upper portion of the retort house, on girders spanning between the coal store and the retort bench. These elevators consist of malleable iron buckets fitted to a strong detachable link chain provided with lugs for fastening the bucket bolts and sliding pieces to. The chain and buckets are guided by a strong latticed iron and steel framing, complete with standards and other attachments for fixing to the coal breaker floor, and also to the overhead fixed hoppers. The elevators are driven by belting and chain gear, with intermediate counter-shaft from the coal-breaker engines. In cases where the coal stores are only on one side of a retort house containing through retorts, the coal is conveyed to the hoppers by horizontal conveyors fixed over the retort bench. Horizontal and slightly inclined conveyors are also extensively used for conveying coal in this way as well as from the stores, when situated at some distance from the retort-house.

STOKING MACHINERY.

At the present time there are hundreds of gas-works with stoking machinery installations in operation, the perfection of which leaves scarcely any room for economy by the more recent invention, or re-introduction of inclined retorts. With machinery, a retort may be discharged and recharged in a few seconds with comparative ease. Manual drawing and charging machines are applicable for small works having an annual consumption of about 2000 tons of coal, but the more comprehensive systems driven by compressed air, or by hydraulic power, are suitable for medium sized and large works. The present method of carbonising coal is in small quantities, of from 6cwt. to 8cwt., perhaps, as a maximum per 20ft. retort. The three systems of charging the retorts at present in existence, are hand stoking, manual or power machine stoking, and the inclined system. The system of inclined retorts necessarily requiring little more than elevators and conveyors, does not reasonably come within the scope of this paper, and tempting as the subject is, must be left out of consideration.

(To be continued.)

A PAROCHIAL hall, in St. Stephen's Parish, Norwich, is in course of erection.

* A paper read before the Society of Engineers, on June 6th, 1898.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

IX.—WINDOWS.

(Continued from page xci, Vol. vii.)

HOSPITAL LIGHTS are so called because they are much used in these institutions and similar buildings, where plenty of ventilation without down draught is a primary, and appearance a secondary, consideration. They consist of a number of small sashes rebated together at their top and bottom edges, and fitted into a solid rebated frame. The lowest one is hung with butts to the cill, the others being pivoted at their lower inside corners, one above the other, to the jambs of the frame; lin. by 3/4 in. fillets are screwed to the jamb linings at each side, at an angle of about 60°, and against these the sashes lie, when open. They are usually fitted with geared quadrant casement fasteners, so that they can be all opened or closed at once. Fig. 149 is a sectional elevation; Fig. 147, inside elevation; Fig. 148, plan; Fig. 150, enlarged details of the junction of two lights in a hospital frame.

147.—INSIDE ELEVATION.

A variation of these in which one pane of glass opens into a triangular metal frame, glazed at the sides, is called a hopper frame.

(To be continued.)

* All rights of reproduction reserved.

THE Mountain Ash Urban District Council is seeking permission to borrow £20,700 for the purpose of carrying out a sewerage scheme for the Abercynon portion of the district.

ANOTHER large landslip of the Lighthouse Hills Cliffs at Cromer has occurred near the same spot as the one which took place about two months ago. This time a piece of the cliff, 30yds. wide by 120yds. long, has been hurled on to the beach, where no small portion of the first slip yet remains, despite the action of the sea. The last and what was the most inland of Lloyd's posts, marking that signal site, is but 19yds. from the edge of the cliff, the two other posts having been carried away with this latest fall and the thousands of tons of earth that went with it.

Surveying and Sanitary Notes.

FEW visitors to Paris, when walking along some of the chief streets of the city, are aware that underneath them there runs a waterway,

148.—PLAN.

or canal, which they may inspect by obtaining permission. The waterway, says the Golden Penny, is nothing more or less than a sewer, but a very different kind of thing to what one usually associates the name with. The Parisians are, in fact, very proud of their sewers, and include them in their principal sights. Some time ago the writer had the opportunity of inspecting the sewers, or, rather, of taking a trip beneath the city. First of all it should be stated that the sewers are spacious, well built, and splendidly kept, and they are reserved for surface water and the waste scraps swept into them from the streets. The journey can be commenced at the Place du Chatelet, where, after descending a spiral staircase for about 50ft., there is a large chamber brilliantly lighted with electric lamps. From here the journey is commenced in carriages built in brake form, with cushioned seats, and drawn by a small electric engine. The passage is lighted with lamps, while the roof is covered with coils of telephone and telegraph wires, and tubes and pipes of all sizes line the sides.

AFTER riding down, or, rather, beneath, the Rue de Rivoli, along the ledge of the sewer, as far as the Place de la Concorde, a change is made into a boat which completes the journey. The Place de la Concorde is the meeting place of the channels which bring the waters from the other side of the river and from the Champs Elysees, and thence they are carried forward along the Rue Royale to join the stream running from the Madeleine to Asnieres, where they are deposited in the Seine. The boat which takes the visitor along the broad channel to the Madeleine is drawn by a magnetic system of towing. This boat consists of an ingenious contrivance with a slide fixed in front of it for the purpose of scraping the sewers clean, but so neatly is it constructed that it is impossible to imagine that it is other than a pleasure boat. The entire route is well lighted, the boat runs smoothly, and the occu-

150.—DETAIL OF HANGING HOSPITAL LIGHT.

pants have plenty of indications as to where they are going, as every street passed is marked by an enamelled plate with the name and number at which it enters the Rue de Rivoli. Altogether this trip is well worth making by all who go to Paris.

Trade and Craft.

AN ASBESTOS EXPERIMENT.

At the exhibition held in Berlin last month, in connection with the Fifteenth German Firemen's Day, the City Fire Brigade authorities arranged a trial, the result of which deserves to be well noticed in the circle of architects and of fire brigades. A small wooden cottage was erected at the expense of the Calmon Asbestos and Rubber Works, London, Hamburg, and Berlin; it consisted of a wooden structure, lined inside with Asbestos millboard, and roofed with Asbestos slate, a new material introduced by the Calmon Asbestos and Rubber Works, and which, no doubt, is destined to play an important part in future buildings for roofing, lining fireproof doors, iron parts, &c. A large fire was lighted inside the house, and kept burning fiercely for over an hour, with the result that the flames in no way damaged the cottage. It was thus satisfactorily proved that

149.—SECTIONAL ELEVATION.

it is possible to protect wooden structures from destruction by fire by the use of proper insulating material. Far too little attention has hitherto been given to precautions of this kind, and among fireproof materials Asbestos millboard deserves to be well known. It is an efficacious insulator against heat, and is easily applied by simply being nailed on. Asbestos cloths, for use in theatres, &c., are also made of the material.

LEICESTER Town Council has decided to promote a Parliamentary Bill to empower it to obtain water supply from Upper Derwent, a distance of 66 miles. The cost of the scheme is roughly estimated at three millions. About fourteen million gallons daily will be obtained.

THE Richmond Rural District Council, Yorkshire, has engaged Mr. Harry W. Taylor, A.M.I.C.E., of St. Nicholas Chambers, Newcastle and Birmingham, to report upon the best means of supplying the village of Middleton Tyas with water. In consequence of the prolonged drought, most of the wells and springs are dry.

The Rampant Arch.

MASONRY.

BY JAMES WILDING.

VI.

IT is impossible to bestow too much care on the setting out of the various forms of arches. Not only should the mould making be carefully performed, but the selection of stone and fixing in position should also be well done.

The bed joints should be as nearly as possible parallel to the natural bed. One of the tests to be applied to good workmanship is to stand underneath the soffit after the centres have been removed, and observe how the lines "carry" round. In a poor arch the lines of the mould will be wavy and irregular; on the other hand, a well worked, well set arch is regular and pleasing in line. In order to ensure accuracy, a trammel should be used on the face of the arch, so arranged as to work along one of the main continuous lines. In a richly moulded arch the bedding material should be kept back from the delicate points; the thickness of the mortar bed should be regular all round the arch. Much has been written and said about the vertical joint at the head of the pointed arch. Those who have had to put arches together nearly always prefer having a full keystone, so that the arch is properly keyed, and not merely resting together on a vertical or plumb joint; if the appearance of a joint is desired, it is an easy matter to stab a joint line on. Although this may be objected to as giving a false impression of its construction, it is not so bad as a "feather-edged" stone; indeed, anything approaching a feather-edge in stone work should be avoided.

THE LANCET OR ACUTE ARCH.—This is a term applied to arches in which the striking point or centre is outside the opening. The example shows a very common combination. The fixing of the striking points or centres, used to describe the arcs forming the arches, is not arbitrary, so long as they are outside the line of opening, or sight, the arch form will be acute. The greatest possible care should be exercised in finding the proper centres; nothing tries the patience of an architect more than to have any difference made in the form of the arch he desires to use. Any centre can be found by using the simple geometrical method shown in the opening at the left-hand side of the figure. The method is as follows: Connect S T, bisect S T, and produce Y Z to intersect the level line A D in B, then B is the required centre. Take the distance L B and make A S to equal it, then A and B are the centres to be used for describing the arch. A little examination of the illustration will make the construction clear. The centres A B are constant, the compasses being opened out to draw the curves 1 2 and the curves of the label mould. All joint lines are directed from the centre, from which the arcs containing the said joints are struck. In making face mould for the arch, $\frac{3}{4}$ in. should be allowed for each bed in small arches; in those which have to bear much weight this allowance should be increased to $\frac{1}{2}$ in. For convenience the centres B and C are used to describe the centre arch.

THE EQUILATERAL ARCH.—With centre A and radius A B, describe the curve B E. With B as centre and B A as radius, describe the arc A E. The outside curves are parallel to the inner ones. The joints are directed from A and B. This arch gets its name from its being founded on the equilateral triangle—a

line drawn from A to E equals one drawn from A to B—B E is also equal to A E.

THE OBTUSE ARCH.—In this form of arch the centre is inside the opening—the opening may be divided into three equal parts, or any two points may be taken inside the opening, so long as they are equal distance from the jamb.

With centre A, radius A K, describe the arc K F.

With centre B, and radius B M, describe the arc M F. The outer curves are directed from the same centres. The joints are drawn from A and B respectively.

THE FOUR-CENTERED ARCH.—Bisect V W, erect R O B.

Divide O B into three equal divisions, viz., O D, D C, C B.

On the left hand jamb erect V A, perpendicular to V W. Make V A equal to O C, that is, two-thirds of O B. Connect A B. From B, at right angles to A B, draw B G.

With V as centre, and V A as radius, mark off V E on V W.

With B as centre, and B O as radius, mark off B H on B G.

Connect E H; bisect E H, and produce bisection to cut B G at S; from S, through E, draw F E indefinite in length.

With E as centre, and E V as radius, describe arc V T.

With S as centre and S B as radius, draw arc T B; the joints below T are directed from E—above T, from S. The joint should be kept clear of the intersection of the two curves. A little attention to illustration will show that the points K and M for striking the other side of the arch are simply measured off, as O K equals O E, and R M equals R S.

The use of the four centres gives the name to the arch. Sometimes it is called a Tudor or Elizabethan arch.

The Equilateral Arch

Four Centred Arch

THE RAMPANT ARCH.—The illustration of this arch is arranged so as to show its use. Two examples are given: the one at the left being the largest, it is chosen as the one to be explained.

The jamb A is higher than B. Connect A B; draw the level line B D; bisect B D in F R; make N F equal to N B in length.

From F, but at right angles to A B, draw F S, cutting B D in C. From A draw level line to cut F C in E. With E as centre, and E F as radius, describe F A. With C as centre, and C F as radius, draw F B. The joints from F to B are directed from C; those from F to A are drawn from E. The height of A above B is not a fixed one; any reasonable height may be taken, and the before described working followed.

(To be continued.)

In the Court of Appeal last week, Lords Justices A. L. Smith, Rigby, and Vaughan Williams gave judgment in the case of *Reg. v. Vestry of St. Mary, Islington* (ex parte Williams). In this matter the Divisional Court had made an order that a mandamus should be issued requiring the Vestry of St. Mary, Islington, to prepare a scheme of such sewers or such diversions or alteration of sewers and works as it might be necessary to construct for effectually draining their parish and district, and to submit the scheme to the London County Council. The rule was obtained by Mr. Williams on behalf of the Midland Railway, the Great Eastern Railway, and the Tottenham and Hampstead Joint Railway Companies. From the decision of the Divisional Court the Vestry now appealed, and contended that they had provided for the effectual draining of the district and otherwise performed all their statutory duties. They alleged that the reason why the line of railway used jointly by these railway companies flooded when there was a storm or any unusually heavy rainfall at a part where it passed through a cutting some half a mile long between Hornsey Railway Station and Crouch Hill Station, was partly because the companies had failed to make proper connections, but chiefly because the Hornsey District Council had wrongfully drained into the same main sewer, which, but for that additional sewage, could have been amply sufficient to carry off all surface water. This additional sewage from the Hornsey district entered the main sewer at a place below where the railway surface-water drained in, and the sewer being thus full the surface-water was backed up, and so caused the area to flood. The railway companies contended, therefore, that the Vestry had not complied with the Act, and that the mandamus had rightly gone.—At the conclusion of the arguments their Lordships delivered judgment, allowing the appeal of the Vestry with costs.

The Acute Arch

Builders' Notes.

THE lowest tender for the projected tunnel under the river at Greenwich was £119,732, while the engineer's revised estimate was £83,175. Sir Alexander Binnie, the engineer, having stated that he would be willing to construct the tunnel at his estimate, provided the amount were made up to £100,000, to allow of the purchase of plant, the Bridges Committee recommended, at the last meeting of the County Council, that he should be authorised to do so.—Dr. Collins thought that the large job just given to the Works Department must be almost enough to satiate the appetite of "direct labour." There would be inconvenience in having two large Works Departments running at once, and he suggested that this report might stand over.—After a short discussion, the chairman of the committee, Mr. Ward, agreed to take the report back.

THE fifty-first annual meeting of the Builders' Benevolent Institution was held recently, Mr. C. Wall (president) occupying the chair. The annual report expressed the thanks of the committee to the subscribers for their continued support to the charity. Last year, to commemorate the Queen's Jubilee and the jubilee year of the Institution, every eligible candidate was rejoiced by receiving the benefits of the charity. That was very satisfactory, and it was hoped that the increased liability of expense would be cheerfully met by subscribers. New subscribers were urgently needed, or the work might eventually have to be curtailed. Mr. B. J. Greenwood was elected the president for the ensuing year.

The Obtuse Arch

THE ATMOSPHERE OF TUNNELS

THERE are no fewer than thirty-five tunnels over 1000yds. in length on English lines, and those of notable extent are the Severn Tunnel on the Great Western 7664, the Totley Tunnel on the Midland 6226, the Stanedge on the North-Western 5342, Woodhead on the Great Central 5297, and Bramhope on the North-Eastern 3745yds. long. The difficulties encountered in the making of these tunnels were enormous; but they were overcome, though the men in some instances were often in peril through subterranean flood, and were obliged to work in waterproof garb, like divers at the bottom of the sea. But it is singular that, after spending wealth far greater than that of any American millionaire on the construction of necessary underground ways, the railway companies should be, apparently, so

INDIFFERENT TO THEIR ADEQUATE VENTILATION.

Possibly they have endeavoured to encourage inventive genius to discover means of driving the vitiated air out of the longest bores; but, judging from the present stuffy condition of nearly every tunnel, one must come to the conclusion that either the inventive faculty is decadent, or the cost of purification too great. Vast improvement has been made in rail track, speed of travel, and train equipment; but the tunnel itself, though better drained, walled, and arched than of yore, still clings to its vile odour and stifling misery. It is possible, the *Gentleman's Magazine* reminds us, to send pure currents of air through the deepest roads and into the furthest headings of the coal mine; but it seems to be "beyond the wit of man" to ventilate a long tunnel. Woodhead Tunnel, through which the shareholders travelled nearly fifty years ago with buoyant hopes and ringing cheers, is such an evil-smelling place that even Lord Wharcliffe (the Chairman of the Company) puts his handkerchief to his nose in disgust when he goes through it. The old fear of tunnel riding is dead, but there is

SCARCELY A SUBTERRANEAN TRACK

in England that is not ill-ventilated, even if ventilated at all. In various parts of the country attempts have been made to clear the fetid tunnel atmosphere by means of air-shaft, Guibal fan, and other apparatus, but the results are far from gratifying. They may satisfy the directors, but the passengers, like "King Gama" in the comic opera, have still something to grumble at. Chemical agency, as well as mechanical appliance, will probably be required to purify the unwholesome air that makes a long tunnel nauseous and stifling. The committee's panacea for the purification of "The Underground" is the adoption of electric traction. Meantime they might suggest that the locomotives at present in use should consume their own smoke, and that the busiest tunnels, wherever they penetrate, should be illuminated by electric light.

THE Bristol Town Council has resolved to promote a Bill for spending £350,000 on dock extension works at Portishead.

Property and Land Sales.

Sale Days for the Year 1898.

MESSRS. FAREBROTHER, ELLIS, EGERTON, BREACH, GALSORTHY, and Co. to announce that the undermentioned dates have been fixed for their AUCTIONS of Freehold, Copyhold, Leasehold ESTATES, Reversions, Shares, Life Estates, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

her appointments for intermediate Sales will also be arranged.

Thursday, Sept. 22.	Thursday, Nov. 24.
Thursday, Oct. 13.	Thursday, Dec. 1.
Thursday, Oct. 27.	Thursday, Dec. 15.
Thursday, Nov. 10.	

essrs. Farebrother, Ellis, and Co. publish in the columns of The Times every Saturday a list of their forthcoming Sales by Auction. They also give from time to time schedules of properties to be sold or leased, comprising landed and residential estates, freehold and leasehold houses, City offices and shops, ground-rents, and investments generally. The list will be forwarded free of charge on application.—29, Fleet-street, Temple-bar, and 18, Old Broad-st. E.C.

the Banks of the Thames.—A Valuable Building and Residential Freehold Property, known as Longfield, near Windsor, well situated, close to the river, five miles from Windsor, about 1½ mile from the railway station, and a little farther from Staines, comprising a capital residence in the cottage style, containing 11 bed and dressing rooms, square entrance hall, opening to conservatory and viney, capital dining room, pretty drawing room, study, and excellent domestic offices; ornamental garden room or studio with electric light; stabling for four or five horses and two ponies, 10 rooms for men, coachman's and gardener's cottages, and numerous glasshouses, outhouses, &c.; surrounded by well-timbered grounds, vegetable, and kitchen gardens, orchard, &c. Adjoining are several inclosures of pasture and arable land with model farm buildings, &c. There are a boathouse and landing stage on the river approached by a private road. The whole embraces an area of about 40 acres; it possesses an important frontage of about 3000ft. to the main road between Staines and Wraysbury, and portions could readily be developed as a first-class building Estate, there being a large demand for houses of moderate size in this favourite district.—Messrs.

EBENHAM, TEWSON, FARMER, and BRIDGEWATER will sell, at the Mart, on TUESDAY, AUGUST 16th, TWO, the above-described FREEHOLD PROPERTY.—Particulars of Messrs. BAKER, FOLDER, and ERTON, Solicitors, 14, Lincoln's Inn-fields, W.C.; and of the AUCTIONEERS, 80, Cheapside.

ACKHEATH, in one of the best positions, facing the Heath, about ten minutes' walk from the railway station, and within an easy drive of the City and West End.

A FINE FREEHOLD PROPERTY, comprising a capital Family Residence, with stabling, three cottages, outbuildings, numerous glasshouses, very attractive old grounds, kitchen and vegetable gardens, and grass paddocks, in all about 14 ACRES.

possessing important frontages and being now RIPE FOR DEVELOPMENT as a BUILDING ESTATE.

possession will be given on completion of the purchase. Messrs.

EBENHAM, TEWSON, FARMER, and BRIDGEWATER will sell, at the Mart, on TUESDAY, AUGUST 16th, at TWO, in one lot, KIDDOKE LODGE, Blackheath, a very valuable freehold small part long leasehold property, occupying one of the best positions in this favourite district, and comprising a spacious old residence, containing nineteen bed dressing rooms, bath room and box rooms, five proportioned reception rooms, billiard room, a grand conservatory with marble fountain, ample domestic offices, and extensive cellars. Spacious living, several rooms for men, two modern cottages, 100 glasshouses, and all necessary outbuildings. The grounds are beautiful old grounds quite secluded, planted with fine timber and shrubs, and laid out in lawns, terrace and wilderness walks, lawn tennis court, kitchen and vegetable gardens, and grass paddocks, the whole forming a most enjoyable home, and embracing an area of about 14 acres. The property possesses the important frontages of about 310ft. to the Heath and about 1000ft. to Kidbrooke-grove; it is well circumstanced, and affords exceptional facilities for profitable development as a first-class building estate, and an inexpensive road being required. There are available beds of gravel and sand underlying portions of the estate. Particulars, with plan and conditions of sale, may be obtained of Messrs. MINET, HARVEY, and MAY, Solicitors, 11, William-street, E.C.; and of the AUCTIONEERS, 80, Cheapside.

By order of the Legatees, of a Freehold Shop Site in a splendid position in the Broadway of South Croydon.

BATCHELAR and SON, Ltd. will sell by AUCTION, at the Greyhound Hotel, Croydon, on WEDNESDAY, AUGUST 11th, 1898, at SIX o'clock, a valuable and important FREEHOLD BUILDING ESTATE, comprising Nos. 80, 82, 84, 86, and 88A, South-end, covered by shop and cottage properties, with a total area of 56ft. 6in., by a depth of 176ft., or thereabouts. Possession upon completion. Particulars, plan, and conditions of sale may be obtained of Messrs. ROWLAND and HUTCHINSON, Solicitors, 102, High-street, Croydon; and of the AUCTIONEERS, as above.

AUCTIONS, 1898.

Sales held locally, and at the Mart, E.C., of Freehold and Leasehold Properties, Ground Rents, Reversions, Land, &c.

BATCHELAR and SON, Ltd. (of North-end, Croydon; 4, Birchington-lane, Cornhill; and The Parade, Beckenham), will be pleased to quote inclusive terms and submit dates.

Notice of Sale of the Constitutional Hall, and of the Valuable Shop Property adjoining, situate in the High-street, Guildford.

MESSRS. HEWETT and LEE are favoured with instructions from the directors to SELL by AUCTION, at the WHITE HART HOTEL, Guildford, on SATURDAY, AUGUST 13th, 1898, at Half-past Three o'clock precisely, in one lot, the valuable FREEHOLD PROPERTY known as the Constitutional Hall, with the committee rooms and offices, now let to Messrs. Brett, Reynard, and Co., whose tenancy will expire at Michaelmas next, at a rental of £80 per annum. Also the valuable Freehold Shop Property and Dwelling House adjoining, known as No. 149, High-street, Guildford, let on lease to Mr. Orridge, at a rental of £75 per annum. The property occupies a very commanding business site fronting the High-street at its junction with North-street and Chertsey-street. Possession of the Constitutional Hall will be given on completion of the purchase.

Particulars and conditions of sale may be obtained of Messrs. SMALLPRICE and Co., Solicitors; or of Messrs. HEWETT and LEE, Auctioneers, High-street, Guildford, Surrey.

Auction Sales, 1898.

MR. GEORGE BRINSLEY will hold his Monthly AUCTION SALES, at the MART, Tokenhouse-yard, E.C., for the year 1898 on the following days:—

Wednesday, Aug. 24.	Wednesday, Nov. 16.
Wednesday, Sept. 21.	Wednesday, Dec. 14.
Wednesday, Oct. 19.	

Landed Estates, Town and Suburban Houses, Building Land, Ground Rents, Business Premises, Reversions, Shares, and other Properties for absolute Sale, will be included in these sales on reasonable terms, which can be fixed beforehand if so desired.

Auction and Survey Offices, 30 and 31, New Bridge-street, Ludgate-circus, London, E.C. Established 1852. Telephone Number, 661, Bank. Telegrams, Bridging, London.

Westgate-on-Sea, proverbially one of the healthiest towns on the English coast, 1½ hours' journey from London.—Valuable sites in choice positions, suitable for the erection of marine residences.

MESSRS. ROGERS, CHAPMAN, and THOMAS (in conjunction with Mr. R. Temple) will sell by AUCTION, at the Station Hotel, Westgate-on-Sea, on WEDNESDAY, AUGUST 31st, 1898, at THREE p.m. precisely, in lots, several PLOTS of LAND, commanding sea views, and others suitable for erection of detached and semi-detached residences of good character; also a few shop plots. Favourable opportunities are offered to gentlemen desirous of building to their own tastes in a select seaside resort, with excellent bathing, pure water, good train service, sheltered gardens, and public promenades. Arrangements can be made for payment by instalments.—Plans, particulars, and conditions of sale of Messrs. FARMER and Co., Solicitors, 66, Lincoln's Inn-fields, W.C.; of Mr. R. Temple, Estate Office, Westgate-on-Sea; and of the AUCTIONEERS, 50, Belgrave-road, South Belgravia, and 78, Gloucester-road, South Kensington.

Sales by Auction for the Year 1898.

MESSRS. JONES, LANG, and CO. beg to state that their SALES of ESTATES, Town and Country Residences, Freehold and Leasehold Investments, Building Land, and other Properties, will be held at the AUCTION MART, Tokenhouse-yard, City, in each MONTH of 1898. Particulars of properties intended for disposal should be sent at least three weeks previous to date of sale.

Messrs. Jones, Lang, and Co. also undertake Sales of Household Furniture, Farming Stock, and general Personal Effects, in town or country. Messrs. Jones, Lang, and Co.'s Printed Tabulated List of Warehouses, Offices, and general Business Premises to be Let or Sold, in the City of London and neighbourhood, can be had free on application.

Auction, Survey, and Estate Offices, 3, King-street, Cheapside, London, E.C. Branch Offices, 101, Leadenhall-street, E.C., and 27, Chancery-lane, W.C. Telegraphic address, "Wonderment, London."

An Architectural Causerie.

The death of a Frenchman as M. Charles Garnier.

The death of a Frenchman as M. Charles Garnier. eminent as Garnier is an affair which should make the more thoughtful among us reconsider how large a debt the world in general owes to the French nation in all that concerns Art. As the late Lord

singularly brilliant people." Charles Garnier was born in Paris in 1825, and his career is somewhat remarkable. In 1842 he entered the *Ecole des Beaux Arts*, studying in the *ateliers* Lévêil and Lébais, and in six years carried off the *Prix de Rome* with his "*Conservatoire des Arts et Métiers*." Under the conditions of this prize he elected to study the Temple of Vesta, the Temple of Jupiter Serapis at Pozzuolano, the Forum of Trajan, and the polychromate restoration of the Temple of Jupiter Panhellenius at Egina, which the French Government published in a most imposing manner in 1852. The following year the Duke de Luynes commissioned Garnier to prepare a work on the Angeline tombs and monuments in Calabria, Naples, and Sicily, which we believe still remains unpublished. Routine work now occupied him as municipal architect till the great competition for the Paris Opera House took place in 1861, when his design, out of 170, was unhesitatingly accepted. This gorgeous, ornate, but convenient building engaged his constant attention for at least

modern French dwelling house. Garnier also excelled as a water-colourist, frequently exhibiting at the Salon, and in 1863 winning a *médaille de la première classe*, and in the following year the Cross of the Legion of Honour; in 1875 he became *Commandeur*, and three years ago *Grand Officier*. His honorary and corresponding memberships were as many as seventeen, and the Académie des Beaux Arts elected him a member in the place of the late Victor Baltard in 1874, and in the next year he became architect to the Conservatoire. At the time of his death he was a member of the Institute de France, and President of the *Société Centrale des Architectes Français*. Garnier was also an original and facile writer with a pleasant vein of humour, but in his monumental works his gravity and learning is almost oppressive. At the present time when theatres are architectural mushrooms all over the country, Garnier's *Etude sur la Construction Théâtrale* (1871) may still be consulted with advantage. His literary gifts were probably

ON TOUR WITH THE A.A. LEICESTER'S HOSPITAL, WARWICK.

Leighton so well said, in 1886, when Garnier was the recipient of the Institute gold medal:—"If you consider the inexhaustible profusion, the endless variety, with which the builder's art has adorned the sunny breadth of that favoured land; whether you turn to their civil Architecture or to their ecclesiastical Architecture; whether you consider that phase of Art which, in the south and in the west of France, reveals to us a Latin severity and sobriety linked with Celtic fire; or whether, further in the west, you observe that superb evolution of the French spirit which during three centuries lighted up mediæval Europe; whether you consider the ornate stateliness and elegance of the *châteaux* of the Loire, or the regal splendour of the buildings of the Grand Siècle, you will feel how vast is the fund of wealth which has been poured into the common treasury of this

fifteen years, and the number of drawings is said to have been 30,000, and the cost 35,000,000 francs. Magnificent grandeur was the dominant note of the scheme, which was entirely finished in 1877, though it was opened in January, 1875. Garnier experienced considerable and unexpected difficulty with the foundations, and it was by laying the concrete under the water on the site and then draining off that a satisfactory result was obtained. No less than twenty-one eminent painters and sculptors (six of the latter) were engaged on the decorations of this building, which made its master-artist famous. Garnier's largest works include the Nice Observatory, the Cercle de la Librairie, the Monte Carlo Casino and Theatre, the buildings at the 1889 Paris Exhibition dealing historically with the human habitation from the mere cave to the

developed in the company of Edmond About, who was his companion in Greece and Italy, and in that of Théophile Gautier, with whom he visited Constantinople. In his graceful French speech at the Institute, on the occasion of the medal, it is interesting to note that, in 1855, when he returned from Rome, he was commissioned by the Préfet of Paris to prepare two water-colours of an architectural character for a presentation album to Queen Victoria. The funeral, on August 6th, was at St. Severin's and the Mont-Parnasse Cemetery. At his grave various addresses were read by M. Boisseau for French artists, M. Ronsej for the Architectes Diplômés, M. Frémiet for the Académie des Beaux Arts, M. Normand for the Société Centrale des Architectes, and by M. Larroumet for the Department of Public Instruction and Fine Art. P. A. R.

A ROYAL MONUMENT.

ALTHOUGH the monument to the Duke of Clarence in the Albert Chapel at Windsor is not yet completed in all its details, it is in its place, and the time has arrived to give an account of this, the noblest work of monumental art that has been created in England since Alfred Stevens made the Wellington memorial in St. Paul's. As one stands before this beautiful tomb, so splendid in conception, so rich and yet restrained in execution, one feels how fortunate it was for the Royal parents and for the country that a man of genius was at hand able to carry out their wish in such a way as this—Mr. Alfred Gilbert, R.A. The site of the tomb is of itself extremely interesting, for it is the exact place, says the Times, where Cardinal Wolsey, in the days of his power, was permitted by his Royal master to place the sarcophagus in which he himself intended ultimately to be laid. We believe that no exact record remains of what this Wolsey tomb as a whole was like, but it was

DESIGNED BY THE GREAT TORRIGIANI,

and round the sarcophagus were railings and candelabra of gilt metal. On the spot where it stood for nearly three centuries there now stands the sarcophagus which contains the body of the young Prince Albert Victor, Duke of Clarence and Avondale; a sarcophagus of Mexican onyx, with the recumbent effigy above, and around it the splendid grille which, as soon as it becomes known to the world, is likely to obtain universal celebrity. The cover of the sarcophagus is of bronze, planned with extreme dexterity, so as to afford a natural resting-place for the effigy—in itself the most important part of the monument, though, from the necessity of the case, it is at some distance above the eye, so that not all the details can be fully seen. The young Prince, clothed in his uniform as an officer of the 10th Hussars, over which are the robes of the Garter, is lying asleep; at his feet there will ultimately be (though it is not yet in place) a little angel holding a broken wedding wreath, in allusion to the marriage which was to have been, but which was cruelly prevented by death. At his head is the bowed figure of a larger angel, who holds the crown of eternal glory which the Prince is to receive in exchange for the earthly crown; and this crown is interwoven with a wreath of olive, the emblem of peace. These

ANGELS ARE OF ALUMINIUM,

a metal which Mr. Gilbert is almost the earliest of our sculptors to employ in so important a way; and it is interesting to note that, although they have now been cast for some years, they have not changed colour, as though to show that when under cover and not exposed to the cruelty of the outdoor London atmosphere, this beautiful metal may be employed by sculptors without danger. Mr. Gilbert's fondness for using several different materials in close conjunction finds full scope in the effigy, as it does in the numerous enrichments of the monument. The face and hands, for instance, are of one material; the dress of another; while the robes of the Order of the Garter, outside, are of bronze, and inside of aluminium. Thus the sculptor has contrived, if not a realistic imitation of his actual subject, at least a suggestion of its light and dark elements. Beautiful as is the effigy, with its exquisite modelling and the poetical quality of its whole design, the distinguishing feature of the monument is the high grille, or railing, which surrounds it. We might just imagine another sculptor achieving the effigy, but the wonderful group of saints and supporting angels which protect it, and the bronze columns between, bear in every line the mark of Mr. Gilbert's talent, and of his alone. Measuring, perhaps, 14ft. by 7ft., this grille is raised a little from the ground by a pedestal of marble, the pale colour of which lightens very happily the appearance of the whole structure. The note of the design is given by the twelve figures of

saints, to which all the rest serves as a support. On either side there are four, at each end two, and all have some special appropriateness, either to the chapel or to the Prince. At present, only the St. George is there, having been placed by the Queen herself a few weeks ago in a position which is not to be its permanent one, but which will permit the public to see it as they stream by on days when the chapel is open. Ultimately—and we hope very soon, since all the figures are finished and ready—the places

AT THE FOOT OF THE TOMB

will be occupied by the Virgin and St. George, the chapel having originally been the "Lady Chapel," annexed to St. George. At the head will be St. Edward the Confessor and St. Edmund, King and Martyr—the "name saints" of the Prince; to the south will be St. Elizabeth of Hungary—suggested by the Queen as representing the Hungarian ancestry of the late Prince Consort; St. Michael, "the angel of good counsel, and guardian of the spirits of the dead"; St. Margaret, for Scotland, and St. Patrick for Ireland. Of these, St. Michael and St. Patrick have also a reference to two of the Prince's Orders. To the north will be St. Nicholas, St. Etheldreda (for Cambridge and the eastern counties, whence the title of Clarence was taken), St. Hubert, and St. Barbara, representing Fortitude. It would be impossible to describe the beauty of these small figures, or the delightful ingenuity with which the artist has rendered them, preserving in each case the traditional character of the saint, while allowing his fancy to have free scope in the materials in which the figure is presented. Thus St. George is radiant in his almost white armour, of the new metal which Mr. Gilbert loves; St. Elizabeth, on the other hand, will be of many colours richly enamelled, and ivory has been freely used for the heads and hands. The stand on which each saint is placed is the

CONVENTIONAL RENDERING OF A TOWN;

and this in turn is supported by two angels, lovely figures in flowing draperies of bronze and silver, with wings of whose fanciful pattern is wrought into a number of exquisite and bewildering curves. Between the saints are columns of bronze, so treated as to suggest the Gothic nature of the chapel, while being themselves scarcely Gothic at all. Here Mr. Gilbert has but followed the precedent of many of the great artists of the Renaissance, who often adopted mediæval motives and gave them an entirely new character of their own. But those who have followed Mr. Gilbert's career know that in this he is only carrying out a type of work of which he has often given examples. It is somewhat humiliating to learn that whereas these bronze columns were cast in England under his own eye, the much more elaborate figures of angels which fill up the spaces between them had to be cast in Brussels, it being impossible to find English workmen of sufficient experience and skill. Decorative sculpture is carried so much further in Belgium and in France than it is with us that the finer mechanical processes connected with it are practised there with a degree of perfection that has not yet been approached in this country. It is said that Mr. Gilbert, who, like so many genuine artists, sometimes allows his enthusiasm to outrun his prudence, has found the work far more costly than either he or his Royal patrons intended, and that he doubts whether he can ever undertake anything of the kind again.

The Hancock Museum, at Barras Bridge, Newcastle-on-Tyne, is being repaired. The work has been intrusted to Mr. Nicholas Maughan, builder, Westgate Road, Newcastle, and the cost, as estimated by the architect, Mr. F. W. Rich, will be about £2500.

A MEMORIAL has been placed in Christchurch, Folkestone, to the memory of the late Rev. Claude Bosanquet, M.A. It consists of a portrait medallion in statuary marble set in an elaborately carved architectural framework in alabaster. The work was executed by Mr. J. Nesfield Forsyth, of Finchley Road, the architect having been designed by Mr. W. A. Forsyth, A.R.I.B.A.

An Old Greek Church Doomed.

INTO the corners of old Soho a good deal of light is being poured. Very soon the zeal of those beneficent Vandals, the County Council, will leave hardly a vestige of the ancient and very undesirable neighbourhood which lay around what is now Shaftesbury Avenue and Charing Cross Road. The Church of St. Mary the Virgin presents to the latter thoroughfare a dark brick wall, broken by groined windows at the height of 40ft. or 50ft. from the ground. This is the newer part of the building. In the rear one may see what remains of the Greek-Huguenot Church, forming the nave of the existing church. This is what has come

UNDER THE COUNCIL'S BAN.

A notice is now to be seen on the side door calling upon "the owner or occupier to pull down the remaining walls." Service may yet be held a few times, but to all intents and purposes the building is a thing of the past. It was built in 1677 by Joseph Georgeirenes, Archbishop of the Island of Samos, who had been driven from his see by Turkish tyranny. The event is recorded in a Greek inscription, still to be seen over the west door. It runs: "In the year of Salvation, 1677, this Temple was erected for the Nation of the Greeks, the Most Serene Charles II. being King, and the Royal Prince Lord James being Commander of the Forces, the Right Reverend Lord Henry Compton being Bishop, at the expense of the above and other Bishops and Nobles, and with the concurrence of

OUR HUMILITY OF SAMOS,

Joseph Georgeirenes, from the Island of Melos." The Archbishop, evidently with a considerate thought for the personal journalism of a later epoch, describes himself as "an indifferent tall man, and slender, with long black hair, having a wart on the right side of his nose, but against his eye, and black whiskers, and very little beard." In the erection of his church for the Greek colony in London he was assisted by a certain Dr. Nicholas Barbone, son of Cromwell's Praise-God Barbone, the leather-seller of Fleet Street. The doctor was a great builder. Newport Square was formerly called Barbone Market after him. Five or six years afterwards the Greeks moved to the City. The Archbishop wanted

TO SELL THE CHURCH

to St. Martin's Vestry, who offered only £200. What became of him afterwards is not known. Until 1822 the church was occupied by the Huguenots, who disposed of the remainder of their lease to a congregation of Calvinist Pædo-Baptists, who remained until 1849. Next it narrowly escaped being turned into a music-hall and dancing saloon. It was saved by the Rev. Nugent Wade, Rector of St. Anne's, Soho. He secured it, and had it consecrated in 1850 by Bishop Blomfield, as a chapel-of-ease to the mother church. During the incumbency of the Rev. J. C. Chambers, 1856-1874, the church was a very energetic agency. School, chancel, north aisle, and clergy-house were built; foundation stones were laid by Canon Liddon and Mrs. Gladstone; the Greek Cross over the west door was given by Lord Selborne. It will interest many readers to know that this is the church introduced by Mr. Hall Caine into "The Christian" as the scene of Father Storm's social work. An influential restoration committee is now appealing for £3000 to rebuild.

MR. HARBOTTLE REED, Hon. Secretary of the Devon and Exeter Architectural Society, writes:—"I was desired by the council of this society, at a meeting held on August 8th, to send you the following, *re* Tavistock Road Competition. 'The attention of the Council of the Devon and Exeter Architectural Society having been called to the published correspondence between the architects of Plymouth and the Corporation upon the above, a resolution was passed approving of the action of the local architects, and expressing regret that the Corporation were unable to accede to their suggestions.'"

On Tour with the A.A.

IN AND AROUND WARWICK.

(By a Special Correspondent.)

THIS year the committee of the Architectural Association must be congratulated on having chosen a particularly happy neighbourhood for its annual week's tour, and another success must be added to the already long list.

Starting early on Monday morning, the 8th inst., Kingswood Station was reached by train, from whence drives were taken to Baddesley Clinton, Knowle Church, Grimshaw Hall, Temple Balsall and Ram Hall.

The Church of Baddesley Clinton is a small building consisting of nave and chancel, with tower at the west end. The nave was originally built in the thirteenth century, the walls were

This has been removed from its original position, and is now on the east side of the chantry chapel. This chapel was founded by Walter Cook in 1403, and in the west wall was the entrance to the rood-loft, now filled in. In this church some good oak furniture remains, most noteworthy being the Elizabethan altarpiece and two carved chests.

Grimshaw Hall, close by, is a fine specimen of half-timber work of the early part of the seventeenth century. The porch is perhaps the most striking feature externally. This is of two stories, being gabled on three sides; these gables are filled in with shaped braces, and overhang, being supported on boldly-moulded brackets. Below are two balustraded openings, which add greatly to the effect. On either side of the porch are gabled wings, also overhanging. The chimneys, though plain, are effective. Internally, most of the rooms are panelled, and the original doors still remain. The staircase is bold and effective.

Temple Balsall, nine miles further along the Birmingham road, consists of the church,

The schools, built in 1867, are good. The church, which adjoins the west side of the hospital, is Early English, and is about 100ft. long and 30ft. wide. The tracery of the windows is varied, and very good. A corbel table at the exterior west end of the church seems at one time to have supported the roof of some adjoining building. There is a curious octagonal turret at the south-west corner of the church, which in 1849 was rebuilt. Previous to this it lacked symmetry, and appeared out of place. Inside the church is of great beauty, and gradually rises in four stages towards the altar, the altar being elevated three steps higher. On the south side is a canopied niche, which seems to have at one time contained the effigy of a saint. The windows are certainly among the chief features of interest, that at the west end being filled in with stained glass. Above it is a very good wheel window of twelve compartments. The east window, also of five lights, is scarcely less beautiful. On the south side of the altar are a piscina and a sedilia, the

ON TOUR WITH THE A.A.

raised 10ft. and the existing clerestory windows inserted between 1496 and 1508 by Nicholas Brome, lord of the manor. The chancel was rebuilt in 1634 by Edward Ferress, lord of the manor, who was buried here. There is some very good glass in the east window, the centre light having the Crucifixion for its subject; the others being filled in with arms and figures of the Ferrers family. A good Jacobean oak screen stands beneath the tower.

Knowle was next visited. In the village, which is very picturesque, there is some good half timber work, notably the Swan Inn, the sign board of which is suspended by some capitably wrought iron.

The church, built of red sandstone, is Perpendicular, and consists of a west tower, clerestoried nave with north and south aisles, north chantry, chapel and chancel. The roof was raised in the fifteenth century, when the clerestory was added, and the chancel was lengthened by the addition of two windows.

The rood-screen is very delicately carved, and a good example of Perpendicular work.

hospital and schools. The Lordship of Balsall was given to the Knights Templars in the reign of Henry III. by Roger de Moubray, "whereupon erecting a church fit for their service of God, and a house for habitation. They sent part of their fraternity hither, and made it a Preceptorie or Cell, subordinate to their principal mansion, unto which Preceptorie were also divers lands of good value afterwards given by sundry persons of qualitie." The property reverted to the donor upon the suppression of the Templars by Edward II. in 1307; but by a decree of Pope Clement V. in 1312 the possessions of the Order were transferred to the Knights Hospitallers. The manor, having passed through several hands, finally descended to Lady Catherine Leveson, who bequeathed the whole of the estate to trustees for the purpose of founding a hospital "for twenty poor persons, being widows and poor women, not married, of good lives and conversations." The hospital covers three sides of a quadrangle, the north side forming the master's house, all being built in red brick with stone dressings.

carving throughout being very rich. The church was repaired shortly after the restoration of Charles II., and again in 1849.

On Tuesday, the second day, visits were made to buildings in Warwick, the first of which to be seen was Leicester's Hospital. Passing under the sixteenth century archway, this picturesque group suddenly confronts us; and the gabled houses, with their diamond panes, surrounding the quaint courtyard with its old world air, make one think the clock hands by some mischance must have got three hundred years ahead of their time. This very fine specimen of timber construction was originally the hall of the united guilds of St. George and Holy Trinity, and was probably erected in the reign of Henry VI. The Earl of Leicester, having determined to found a hospital for the relief of poor people, signified his desire, in 1571, to the bailiff and burgesses, whose property it now was, that the building should be handed over to him for this purpose. As the Earl's signification was probably equal to his command, this they did, and a hospital was founded, which was to accommodate twelve

ON TOUR WITH THE A.A.

MAR LODGE.

A CHARMING DEESIDE RESIDENCE.

THE Duke and Duchess of Fife have now entered into residence at Mar Lodge, the new structure which has taken the place of the building burned down three years ago. Her Majesty the Queen has never ceased to take an interest in the new building from the time of the selection of the site, and—as a gilt-inscribed granite panel in the east wing tells—the day on which she laid the foundation stone, on October 15th, 1895, down to the eve of her recent departure from Balmoral, when Her Majesty visited the new residence, and is understood to have expressed her pleasure at the appearance of the structure and at all the arrangements connected therewith. Then it is of special interest to note that both

IN THE GENERAL DESIGN

and in the working out of the details the Duke and Duchess have left their individual impress. The Duchess has, more especially, taken the keenest interest in the minutest details of her new residence. The Duchess (says the Daily Free Press) drew the first rough sketch of the newly completed Mar Lodge, on which Mr. A. Marshall Mackenzie, A.R.S.A., the architect of the building, has worked. She designed practically every fireplace in the lodge, suggesting many effective details otherwise, and selecting, with a taste which never failed, the colour and pattern of wall-paper or ceiling. Prior to the disaster of three years ago, it may be well to note, there were two Mar Lodges—Mar Lodge, the building destroyed by fire, which stood on the south side of the road fully three miles beyond Braemar, and about a quarter of a mile beyond Corriemulzie Falls; and Old Mar Lodge, nearly a mile further west, standing on the opposite (or north) side of the Dee.

After the destruction of Mar Lodge, it was resolved to

ERECT THE NEW RESIDENCE

at Old Mar Lodge. Passing along to the new residence, therefore, one finds the avenues that led to Mar Lodge before the fire entirely closed up, and on crossing the river three-quarters of a mile further west by the pretty Victoria Bridge, one comes in sight of the new residence, erected directly in front of the site of Old Mar Lodge. That old building has been demolished, and one result has been to open up to view from the new residence some handsome pines that crown the heights of Creag a' Bhullg behind the lodge, which give some notion yet of the magnificence of the great Forest of Mar, that contained, according to the veracious Pennant, "the finest natural pines in Europe." Mar Lodge is built facing the south

IN A SORT OF CRESCENT FORM,

the rear portion being constructed as three sides of a hollow square, with the opening towards the north. The front and main portion of the lodge is of two stories, with attics, an additional story being put in at the back, which is not seen, as one approaches the lodge along the avenue, from the river. The style of architecture is more than anything else the Old English half-timbered style of structure, which, with its picturesque gable-forms, is very appropriate in a Highland lodge. It is a feature in connection with the new building that, practically, all the wood and stone employed is from the Fife property. The lodge is built from granite quarried on the neighbouring hill of Morrone. It is a very beautiful coral pink granite, of a remarkably clear complexion. The timber beams which support the overhanging gable roofs are of heavy pine, from the adjoining forest, and these gables are filled in with granite chip work and finished with a harling composed of crushed quartz, gathered from the Cairngorms, the glitter of which is quite dazzling in the sunlight. Round the lodge runs a verandah, 750ft. in its entire length, supported on the trunks of native spruce fir, twisted branches of the same being effectively utilised to form the spreading "bracket" supports of the verandah roof. These supporting timbers—all the external woodwork, indeed, is stained a rich brown colour and varnished. The run of the verandah is interrupted at five points. One is at the main entrance to the lodge, which is covered by a pediment porch, the woodwork of which is of the same rustic character as the verandah. The other points of interruption are the four projecting windows—two on each side of the porch—the tops of which are formed into balconies, entered from windows on the first floor. All the windows are of

THE GRACEFUL FRENCH CASEMENT STYLE,

and attention may be directed particularly to the specially pretty "corbelled-out" windows which adorn what may be termed the end-gables of the lodge. The chimneys have been made to form one of the most pleasing decorative features of the new building. They rise, in the pretty pinkish granite, like clustered shafts which group admirably to the view. Both main building and verandah are roofed with small square ruby tiles, a production of the English potteries. These suit the granite of which the lodge is built, and heighten largely the picturesque effect of the general design. The inside of Mar Lodge is quite as interesting as the exterior. On ascending two granite steps at the main entrance and passing the outer door of Burmah teakwood, one finds oneself in

THE LOFTY AND SPACIOUS HALL,

22ft. wide from right to left as you enter, and extending backward 47ft. The floor is of oak parquet, covered with an occasional rich rug or matting. The walls and ceiling are lined throughout with a light-coloured pine, elaborately wrought in moulded panels, and stained and polished. A magnificent fireplace of the "well" grate design is inserted in the hall, which has a breadth of actual fireplace of 3ft. 6in., constructed specially for the burning of wood blocks, which must form the staple fuel. The fireplace is encircled by a massive

poor men, who were to be presided over by a Master. By an Act of Parliament passed in 1813, the salary of the Master is fixed at £400, and the payments to the brethren at £80 per annum.

On entering the quadrangle the carved barge-boards of the gables are very noticeable, the latter being terminated at their apex with figures of white bears with poles. One side is occupied with the Master's house. On the east is a corridor leading from the common kitchen to the Master's lodge. Approached by a flight of steps is another corridor. At the top of the stairs are the remains of the old Guild Chamber, now divided into rooms for the brethren. In one of the spandrels of the framework of the roof is the red rose of Lancaster, which seems to point to the fact that this building was erected in the time of Henry VI. The banquetting hall is now used as a laundry and coal-house, but it is evident from the one remaining rich piece of carving here that formerly this was a noble apartment. The kitchen contains some ancient oak furniture, mostly with a history attached.

The chapel dedicated to St. James is appropriated to the use of the hospital, and contains a good carved oak screen.

St. John's Hospital, Warwick, was originally founded in the reign of Henry II. "for entertainment and reception of strangers and travellers, as well as those that were poor and infirm." The present house was completed about 1626, and is a large and handsome stone mansion, having two wings with large mullioned bay windows, and a porch in the centre. The front has five gables, the three over the porch and bay windows being originally ornamented with curves and scrolls; the porch gable, however, has been replaced by a plainer one, the original having been blown down. Inside, a good Jacobean staircase will be noticed.

(To be continued.)

INN. KNOWLE
HEWLENG.
86

ON TOUR WITH THE A.A. THE SWAN INN, KNOWLE.

mantelpiece of dark purple marble, above which is a handsome mirror that will reflect the light from the elaborate brass "electricolier" of eighteen jets, which, depends from the centre of the ceiling. From the back of the entrance hall rises

THE MAIN STAIRCASE.

Light is admitted, at the height of the first landing, through an ornamental window of muffled or "misted" glass, and falls on the hall through a beautiful hall screen of carved woodwork. On passing into the hall by the main doorway, one finds a door at either hand, leading to the right and left. The door to the left, or westmost side, leads into the private dining-room of the Duke and Duchess, an airy, beautiful room, 19ft. 6in. by 17ft. 6in., with ample bookcases along one side, and with an outlook across the lawn and river quite delightful. The room is panelled with light-coloured pine to a height of 8ft., and around the cosy-looking fireplace is a mantelpiece in dark Italian marble. A door in the room, opposite that which allows entrance from the hall, leads from the private dining-room into the adjoining large dining-room, 35ft. long and 19ft. 6in. wide, suitable, therefore, for quite a large party of guests. This room has two windows looking to the front. Like the smaller dining-room, it is panelled with pine to a height of 8ft. from the oak floor. The remainder of the walls is papered with a heavily-embossed bright ruby paper, and the ceiling is panelled after the manner of the dado. In this case the mantelpiece is of a rich green marble, marked with white veins. The striking feature in the large dining-room is the magnificent display of deers' heads on all sides, that tell of many an exciting day in the neighbouring forest.

THE TWO DINING-ROOMS

occupy the space between the porch and the west wing. The remainder of the front, along the west wing, is taken up with large bedrooms for guests. Returning to the entrance hall, and taking the door on the eastmost side, one enters the spacious drawing-room of the lodge, which occupies the entire space on the front between the porch and the east wing, corresponding to that which the two dining-rooms occupy between the porch and the west wing. It is a noble room, 46ft. long by 18ft. wide, designed in the rich and delicate style characteristic of the celebrated designer, Adam. From the floor, which is closely and heavily carpeted, rises to a height of 3ft. 9in., a dado of panelling in light pine, the panels being set in frames of the

CLASSIC "EGG AND DART" CARVING.

Thence to the frieze the walls are covered with a rich, dark green French paper; the

frieze moulding is also of light pine, and the ceiling is of raised plaster work, formed into numberless medallions, exquisitely entwined. At each end of the room is a "well" grate, set in beautifully-tinted pink tiles, the mantelpieces being in pink and white marble. These are surmounted by rich overmantels, bearing the ducal and Royal crests, and set between fluted pilasters, whence spring clusters of electric lamps. In the east wing, next the drawing-room, is the billiard-room. It also is a handsomely-appointed apartment. Magnificently antlered heads look down from the walls, above this "decoration of the chase" appearing

THE MASSIVE GREEK CORNICE,

and the rich ceiling of decorative fibrous plaster work. The billiard table occupies one end of the room; the other end, with its deep oriel window, is specially set apart for the use of smokers, and, if desired, for writing purposes. The remainder of the front, in the east wing, is occupied by guests' bedrooms. The rooms hitherto described all lie along the front of the lodge. Entrance to all of them is provided from a main corridor which runs along the centre of the main building from end to end. On the opposite side of the corridor, westward of the entrance hall, are the butler's pantry, just opposite the dining-rooms, with wine cellars adjoining, then the room of the groom of the chamber, shoe room, brushing room, and bedrooms to the end of the west wing. Eastward of the entrance hall are a secretaries' room, housekeeper's room, and bedrooms to the end of the wing. In the

REAR PORTION OF THE LODGE,

on the ground floor, are the kitchen, servants' hall, still room, steward's room, packing room, beer cellar, and other similar accommodation. This rear portion, it may be said, is practically a separate building from the lodge, divided from it by a wide passage, though the whole forms one group of buildings. Ample bathroom and lavatory accommodation is provided on this as on all the floors. An abundant and excellent supply of water has been laid on from Craig Valloch, a little distance north-west of the lodge, where two springs have been utilised and the water collected in a reservoir, whence it is conveyed in pipes, underground, to the lodge. Passing up the main staircase to the first floor, the private apartments of the Duke and Duchess are reached. These occupy the front, immediately above the dining-rooms, entrance-hall, and drawing-room. Above the entrance-hall is the private bedroom. Directly east of it is Her Royal Highness's sitting-room, and next to it the night nursery, then the day nursery, with nursery maids' rooms adjoining. West of the bedroom is the Duke's dressing-

room, and westward of it, his Grace's private sitting-room. The rest of the accommodation on this floor, and, indeed, of the other floors as well, is taken up with bedrooms, bath-rooms, &c. It will give a very fair idea of the large amount of

ACCOMMODATION AT MAR LODGE

to mention that it contains 20 guests' bedrooms, about 50 servants' bedrooms, and about 120 rooms of all kinds. The heating and lighting of the lodge are both effected by means of electricity. To supply the motive power, the stream of Corriemulzie has been harnessed, as has been said. Some distance above the Falls a large dam has been formed for the accumulation of the necessary water. At the Falls there is a headlong rush which develops fifty horse-power in the turbine, and at the adjoining power-house the dynamo develops power to the amount of 240 volts, and at the lodge, about a mile distant, 170 volts. To the lodge the power is transmitted

BY OVERHEAD COPPER CABLES.

These are connected with the main switch-board, whence radiate three special circuits for the house, another for the beautiful little Norman chapel erected in the grounds to the east of the lodge, another to the stables near by, and another for the ballroom—which has been transferred from near the Mar Lodge which was burned, and re-erected among the trees to the west of the new residence. For the heating of the building radiators are placed at all needful points, and an equable temperature of sixty degrees maintained. For the lighting there are in the house, alone, no fewer than 526 lights, ranging in power from eight to sixteen candles. In the stables—where there is accommodation for thirty-six horses—there are between forty and fifty lights, and in the ballroom there will be a specially brilliant illumination by means of lights, some of which run as high as fifty candle-power. It may be added that arrangements have been made in connection with the

ELECTRIC INSTALLATION

by which the supply of water to the Falls of Corriemulzie will be utilised only during the night, so that the Falls may retain their wonted beauty during the day. The cost of the lodge, with the attendant works, enlargement of the garden, &c., is between £15,000 and £20,000. The contractors for the work were as follows: For the lodge—Mason work, Mr. Edgar Gauld, Aberdeen; carpenter, Messrs. M'Robbie and Milne, Aberdeen; slater, Mr. James Grant, Ballater; plumber, Messrs. J. Blaikie and Sons, Aberdeen; plasterer and fire-proof floors, Messrs. Stuart and Co., London; iron work, Mr. George Bisset, Aberdeen, and Messrs. J. Abernethy and Co., Aberdeen; electric bells and cooking ranges, Messrs. M'Hardy and Son, Aberdeen; electric lighting and heating, Messrs. P. C. Middleton and Co., Aberdeen; fibrous plaster work, Messrs. Hay and Lyall, Aberdeen; well fires, Messrs. J. Bannochie and Sons, Aberdeen; painting and glazing, Messrs. G. Donald and Sons, Aberdeen, and Messrs. Maple and Co., London. The approaches have been laid out by Mr. A. G. Cumming, Braemar. For the large stables, erected a short distance eastward of the lodge, the contractors were: Mason, Mr. George Hall, Aberdeen; carpenter, Mr. D. Macdonald, Braemar; slater, Mr. James Grant; plasterer, Messrs. Stuart and Co.; painter, Messrs. Donald and Sons; plumber, Messrs. Blaikie and Sons; and electric lighting, Messrs. Middleton and Co.

THE foundation stone of a new edifice which is to take the place of St. James's Church, Aston, a structure formed chiefly of corrugated iron, was laid a week ago. The new church will cost over £4000.

ALL SAINTS CHURCH, Cheadle Hulme, is about to be enlarged by an extension of the nave westwards, and by the addition of a new south aisle with a porch. The font will be placed at the west end of the proposed new aisle. The accommodation will be increased by 177 sittings, and the expense will amount to £1800.

BARRACK BUILDINGS.

A NOTABLE ERECTION AT PORTSMOUTH.

COMMENCED as far back as October, 1893, the last portion of the new Clarence Barracks, Portsmouth, has only just been completed. On the vast space of ground extending from King's Terrace to High Street, and from Alexandra Road to Pembroke Road, are three typical barracks, viz., the old "Cambridge," a severely plain and unattractive building; the "Victoria," much more elaborate, commodious, and comfortable, erected principally by convict labour; and the "Clarence," built from up-to-date plans, embracing all the latest sanitary improvements, and acknowledged to be the most palatial, and the finest barracks in every respect, erected in any part of the kingdom. Compared with some of

THE FIRST BARRACKS CONSTRUCTED IN PORTSMOUTH,

the new erections are indeed palaces, and their construction in the present day style shows an advancement in many respects. Many improvements are needed in connection with some of the old Portsmouth barracks to make them as comfortable as they ought to be. Take for instance the Colewort Barracks. They are generally very inconvenient for the purposes for which they were built. The rooms are low and stuffy, and the structural arrangements will not allow of their being brought up to modern requirements, notwithstanding that money is year by year expended in making alterations. The quarters for the married soldiers are badly arranged, and it is anticipated these barracks

WILL SOON BE CONDEMNED,

and buildings erected in their places more on the plan of the Victoria and Clarence Barracks. With this object in view, the War authorities have purchased some property in Armoury Lane, which will probably be the site of a new canteen. Where the Colewort Barracks stand was formerly the Priory of St. Mary. There is evidence that it was in ruins in 1716, that in 1718 it was in the possession of the War authorities, and that materials arising from its demolition were used in the reconstruction of St. Thomas's Church. The Cambridge Barracks were built at a later period than the Colewort. Many improvements are contemplated, including the provision of extra sculleries at the married men's quarters, additional ablution rooms in the men's quarters, and improved facilities for bathing, plans for which have been prepared for some time. The Clarence Barracks consist of five

HANDSOME BLOCKS OF ELABORATE DESIGN,

in the domestic Gothic order of Architecture, and it is to be regretted that the front of the main building could not have faced a main thoroughfare, where its fine proportions might have been the more freely and fully admired. The barracks are built on the pavilion system, this being a great improvement on the old block system—on which lines the "Cambridge" was erected. A feature of the interior arrangement is that in none of the barrack rooms are there angles or corners, and thus the accumulation of dirt is prevented. Generally, it may be stated that the barracks have rooms three times larger than those in the old ones; the ventilation and lighting are much superior. The staircases throughout are made of best hard Shipley stone, on which there is no danger of slipping, and in the arrangements the comfort of the men has received due consideration. The foundations for the buildings proved a serious difficulty, covering as they do the old moats of the fortifications. All

THE OLD FORTIFICATION WALLS

had to be taken up, and new foundations put in to a depth of 20ft. Ten feet of tidal water had to be dealt with, and steam pumps were kept going night and day for months, but eventually all the difficulties were overcome, and the work was most successfully accomplished. The new buildings are all erected with best red Fareham and Foster's bricks,

with Portland stone dressings, and the roofs are of red Horndean tile.

THE OFFICERS' BLOCK

is conveniently situated, facing Pembroke Gardens, is a magnificent pile, and an ornament to the neighbourhood from an architectural point of view. The splendid mess, arranged in the central part of the building, has been elaborately fitted up by the officers. There are ante and billiard rooms, servants' quarters, and lavatories. The corridors throughout are laid with polished marble terrazzo paving, executed by Messrs. de Grelle Houdret and Co. The stoves and chimney-pieces were all specially designed for the building, this portion of the work being carried out by Messrs. Yates, Haywood, and Co., of Rotherham and London. The mess, ante, and billiard rooms and vestibule are lighted with the electric light from the Corporation supply. The general contractors for this block were Messrs. Armitage and Hodgson, Leeds. In the front is a lawn and garden, and there are two beautiful lawns at the back. The soldiers' barracks consist of three blocks, to accommodate nearly 1000 men. Running parallel with Alexandra Road is a detached block, which provides quarters for 276 N.C.O.'s and men, with a fine sergeants' mess in the centre, consisting of mess rooms, billiard room, kitchen, scullery, and all accessories.

THE COAT OF ARMS IN THE GABLES,

which adorns this block, appear to be cast in terra cotta, but as a matter of fact all the panels are beautifully carved in red rubbing bricks. The recreation establishment in the centre building in the long range includes large recreation room and lecture hall, each 61ft. by 30ft. There are also reading, writing, and coffee rooms and library, with regimental offices on the ground floor. Each soldiers' block has its own cook house, baths with hot and cold water, latrines and company offices, and stores complete. There is a large regimental canteen, also separate rooms for corporals, together with a well-furnished grocery bar, guard house, fire-engine house, officers' stables, and shoemakers', smiths', armourers', carpenters', and tailors' shops. These blocks and accessories were erected by Messrs. Perry and Co., of London. The latrines and urinals were supplied by Mr. George Jennings, Lambeth.

THE BUILDINGS FOR MARRIED SOLDIERS

consist of five blocks, to accommodate 108 families, and attached to them are laundries and wash-houses complete; and a large underground tank, holding 18,000 gallons, is provided for storing rain water for washing purposes. These blocks were built by Mr. H. J. Sanders, of Southampton. The schools for infants and adults, comprising all the latest improvements and modern fittings, were erected by Messrs. W. R. Light and Sons, of Portsmouth, who also built the quarters for eight warrant officers in Burnaby Road. The sanitary arrangements throughout comprise the latest improvements, and are up-to-date in every respect, while

THE DRAINAGE

is as perfect as modern science could make it. A large portion of the drain pipes are of cast iron, with caulked lead joints, supported in some places by specially driven piles. A good idea will be formed of the extent of this particular work when it is mentioned that in connection with the barracks there are about six miles of drain pipes, there being two distinct systems, one for sewage and the other for surface water, the former being connected with the town main drainage, and the other being discharged direct into the sea. The total cost of the Clarence Barracks has been about £160,000, or something like £40,000 more than the sum expended upon the Portsmouth Town Hall, with its expensive ornamentation and elaborate furnishing. The works in connection with the new barracks were carried out under the direction of Lieutenant-Colonel C. Wilkinson, R.E., late C.R.E. Portsea Sub-District, and Major Darling, and supervised throughout by Mr. E. North, of the R.E. Civil Staff, and several assistants.

Drawing in the Board Schools.

TIME was when the drawing done in the Board Schools was of little importance—tame, uninteresting, useless. But they have changed all this, and for a year or two (since the introduction of what is known as the "new alternative syllabus") the scholars have been turning out original designs in colour, tile patterns, panels, friezes, &c., which are not only good studies in conventional ornament, good in colour and in form, but they have a commercial value. This syllabus, which has caused quite a revolution in the methods of imparting a knowledge of drawing to the young, was introduced, the Westminster Gazette recalls, by Mr. Acland just before he left office, and the successful results that have been achieved more than justify its adoption. For the usual course of alleged "freehand" and

MODEL DRAWING

with a hard pencil point, as encouraged by the South Kensington authorities, is substituted a course of drawing with the flexible point of a sable brush charged with colour. This true freehand is done straight from the shoulder upon sheets of paper clipped to slabs of heavy millboard wedged into the slate racks at the back of the desks, thus serving as easels. The youngest boys begin with an exercise in coloured chalks on brown paper, to obtain freedom and facility in striking curves; then certain elements of design are sketched on the board, or natural flowers, fruit, and vegetables are put before them, and from these forms the boys work out

A PATTERN IN ANY COLOURS

their fancy dictates, to fill a given space, such as a square, oblong triangle, or circle. It is positively amazing, and not a little amusing, to see a big class of youngsters, say eight years old, dashing away at their sheets of brown paper, and turning out creditable designs by the score. Robbed of their colour they lose much, but when it is remembered that these boys, all under fourteen years of age, have no cultured home surroundings, no access to art galleries in their neighbourhood, and only two hours a week devoted to the work, it must be conceded that the teaching is now on the right lines. The boys show great enthusiasm for the work, and beg for paper on which to do drawings at home. It would be a thousand pities if talent thus cultivated were not turned to account when the boys leave school, but it is to be feared that unless some opening for their employment as

DESIGNERS, ART DECORATORS, POTTERY PAINTERS,

and so forth, are put in their way, the boys will drift into occupations in which this training of hand and eye, so wisely introduced by the Education Department, will be almost entirely thrown away, which would be a distinct loss to the community.

The new Roman Catholic Church of St. Teresa, Birkdale, has been opened.

The Bishop of Salisbury consecrated on Saturday week a new church at Bryanstone.

Foundation stones for a Free Methodist Chapel, Kippax, to cost about £1500, have been laid.

ARRANGEMENTS have been made for the erection of a new church at Elland on a site given by Lord Savile.

The Ramsgate Corporation has decided to offer prizes for competitive plans for the proposed kursaal under the Western Promenade.

The memorial stones of a Wesleyan chapel and school at Rhodes, near Middleton, have been laid. The new building is estimated to cost about £2650.

A SITE containing over 1600 square yards has been secured for the erection of a Wesleyan mission chapel and schools on Messrs. Mather's estate in Liverpool Road, Eccles.

FRESH by-laws as to the width of new streets in York are now in force, and in future streets in that city under 100yds. long will have a minimum width of 30ft.; over 100yds. and under 200yds., of 36ft.; and over 200yds., of 42ft.

Now Ready.

The Superb AUGUST Number of
 . . . THE . . .
Architectural Review.

The Magazine for the Artist and Craftsman,

Price **I/=** Nett.

With the August Number are presented as Supplements
Two Magnificent Full=Page Plates:

No. I.

A Beautiful Photogravure from the Drawing by F. L. Emanuel:

"The old 'Horse and Groom,' back of Holborn Above Bars, being the first of a Series of Plates of

"COMING-DOWN LONDON."

No. II.

A Chromotype Plate from the Water-colour Sketch by Edgar Wilson:

"A RUINED CASTLE."

SPECIAL ART SUPPLEMENT:

Architecture and Crafts at the Royal Academy:

Being the Fourth and concluding Supplement of the Series, extending over the past four months, devoted to an exhaustive Reproduction of all the Leading Designs in Architecture and Applied Art at this year's Academy.

The Literary Contents of the AUGUST NUMBER are of more than usual interest, including such varied Subjects as

A SPANISH COLONIAL CITY, fully Illustrated.

BARNSTAPLE IN THE SEVENTEENTH CENTURY, profusely Illustrated.

FOUNTAINS AND WATER TREATMENT: another instalment of Mr. A. E. Street's Series of Articles.

THE ARCHITECTURE OF "MUCH ADO ABOUT NOTHING," at the St. James's Theatre, Illustrated by Patten Wilson.

THE CHURCH OF ST. MARY THE VIRGIN AT OXFORD, by T. G. Jackson, R.A., Illustrated.
 Etc., Etc.

Price **ONE SHILLING** Nett.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 17th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ONE of London's most notable houses is to be altered and reconstructed almost past recognition. This is the house in the middle of the west side of Leicester Square, with fine frontage and long first-floor windows. It has a history almost unique in interest. For thirty-two years it was occupied by Sir Joshua Reynolds, and before that by Henry Morland—father of a more famous son—who painted the two beautiful Miss Gunnings, respectively "Washing" and "Ironing," in the National Gallery.

IN Sir Joshua's time no house in London had so illustrious a crowd of visitors. There is a stately, last century flavour about the Georgian hall, with its fluted Corinthian columns. The newels from which its balustrades start are carved with acanthus leaves, and taper delicately to the base. Reynolds had the house remodelled, and he spent £1500 on a new gallery and painting room. He was at his easel by nine in the morning. During one year the number of his sitters was 162.

AN extraordinary building is being erected in New York in order to reproduced the art and architecture, manners and life, of the Egyptians, Assyrians, Greeks, Romans, Saracens, &c. It is being done on a very grandiose scale; for instance, in the Hall of Kanak, which is being reproduced, the columns are constructed full size, being 7ft. high and 12ft. in diameter, and the Assyrian throne-room from Nimroud is of the same size; and so is that which depicts the grandeur of Rome in the time of Constantine. The Saracenic rooms will, of course, be reproductions of the Alhambra. The building is to be completed in less than a year.

IT is satisfactory to know that up to the present there is no official declaration about seizing on the masterpieces in Spanish galleries by the Government of the United States as security for the indemnity which will have to be levied. The proposition to imitate Napoleon's conduct is not worthy of a nation that is mainly Anglo-Saxon. Great satisfaction was felt in England by painters when they found that the treasuries of Italian cities and palaces were brought together in Paris. Haydon, Wilkie, West, and others rushed across the Channel to enjoy the sight. But the pictures had eventually to be returned, and the memory of the transaction is not advantageous to France. Some of the American newspapers are endeavouring to persuade the Government to enrich New York with Spanish spoils, but the good sense of the country must be opposed to such a revival of vandalism and spoliation.

ART as a softener of international asperities has had many triumphs. Not one of these was more memorable in its way than that by which Prince Bismarck and Pope Leo XIII. were brought into touch. The medium of communication was Franz Lenbach, the famous Bavarian painter, to whom the Pope gave, not only sittings, but a commission to paint the portrait of his "enemy." Bismarck, much pleased, gave a return commission; and the restoration of friendly relations between the Roman Pontiff and the German Chancellor, whether by mere coincidence or not, certainly dated from the time when each adorned his apartments with the portrait of the other.

ARTISTS are naturally not a little concerned to hear that there is a possibility of serious damage being done in the near future to one of the most picturesque and frequently-painted spots in the West of England. A new light railway is threatened through the district surrounding Lynton and Lynmouth, and the route chosen is one which will most unnecessarily obtrude the utilitarian formality of the line. The scheme is one certain to excite very active opposition; but if this opposition is to be effectual it must be prompt, for the sitting of the Light Railway Commissioners at which the new undertaking is to be discussed will be held this week.

IT is stated that the plans for an Archbishop's residence at Canterbury have now been definitely settled by the Ecclesiastical Commissioners. Additions are to be made to the house that was in former times the Archbishop's Palace, and some buildings in Palace Street are to be pulled down for the purpose of allowing of the extension. The scheme is a large one, and when carried out will greatly add to the architectural features of the cathedral precincts.

THE engineers are, it is stated, engaged in the preliminary work connected with the scheme for a new electric underground line from Baker Street to Waterloo. It is reckoned that this line will take about four years to complete, and it will be three miles long. The southern terminal station will be close to the terminus of the Waterloo and City. From that point it will run under the river towards Charing Cross, and there will be a station at the point where it crosses the District Railway running along the Embankment. Thence it is to run to a station at Piccadilly Circus, and up Regent Street to another at Oxford Circus. The line will thence run down Portland Place, across the Marylebone Road, and round to the left to the south-western corner of Regent's Park, where the Baker Street terminus will be.

A DISTINCT advance in the progress of the world towards ease and comfort is marked by the announcement of the chairman of the Metropolitan Railway Company that experiments are about to be instituted with a view to the substitution of electricity for steam power in London underground traffic. Other people's experiments, it is true, have already demonstrated the feasibility of the change proposed; but it would no doubt be inconsistent with the dignity of a great corporation to plunge into new methods without supplementing these by experiments of its own. In the meantime the mere passenger can only express the hope that these experiments will be conducted with all possible celerity to their inevitable result.

ON September 4th next there will be erected at Brescia a monument to the celebrated painter, Alexandro Bonvicino, nicknamed Il Moretto, who was a native of that town. The monument is by the sculptor Domenico Ghidoni. The greater number of Il Moretto's pictures are still in the churches and gallery of his native place; but here in London, too, we are particularly rich in specimens of his cool and silvery brush. So his admirers in this country should go on a pilgrimage to the National Gallery on September 4th, the 400th anniversary of his birth.

AT the second day's proceedings of the annual meeting of the Society of Art Masters, in the lecture theatre of the South Kensington Museum, Mr. W. Scott, the president, in the chair, various matters affecting the interest of Schools of Art were discussed. In the matter of the attendance grants, it was decided to await the apportionment of the grants for the past year and to make inquiry of the members respecting them. The meeting also decided that representation should be made to the Science and Art Department as the desirability of making payments on attendances in drawing and painting from the "head life" and the draped figure.

AT 30, Parliament Street, the Art Memorial Society has on view a bust of Mr. Gladstone, the work of Mr. H. C. Fehr, whose "St. George and the Rescued Maiden" is a prominent feature amongst the works of sculpture in the central hall at the Royal Academy. Mr. Fehr's bust, which is in scale rather larger than life size, represents the statesman in the later, though not quite at the latest, stage of his career. The shoulders are draped with his doctor's gown, and the head is full of animation and spirit.

FOR an architect's or engineer's estimate to be exceeded is an almost invariable rule, but at a recent meeting of the Metropolitan Asylums Board an instance of the reverse being the case was afforded. For certain works to be carried out at the North-Western Hospital, the estimate given by the architects was £1080, whereas one firm expressed their willingness to undertake the work for the sum of only £643, just three-fifths of the amount that had been anticipated by the Board.

AN interesting anniversary to all lovers of "the old city," to use the phrase adopted in the now moribund unification report, occurred recently. Just 138 years ago on three of the old City gates—Cripplegate, Ludgate, and Aldgate—were sold by order of the Corporation, the purchaser, a speculative builder of the name of Blagden, paying for the materials the sum of £416 10s., and undertaking to remove the debris and restore the roadway to its original condition prior to the end of the following September. Even in those days, it is interesting to note, contractors were not always men of their word as regards completing the work by the date specified. Thus we read in the Corporation minutes that in the following December only Bishopsgate was sold, while Aldgate was "almost down," and Cripplegate would be "cleared" in less than a month. According to all reports, Blagden made a very fine profit out of the venture by selling as relics the decorative portion of the gates.

THE majority of the members of the Town Hall Committee of the Cardiff Corporation were surprised when, at their last meeting, the Town Clerk pointed out to them numerous defects in the accommodation which they had arranged in the costly new municipal buildings which are to be erected in Cathays Park. There was, he said, no provision for the tramways department, but it was pointed out in reply that the Committee would not have been warranted in making provision for this department at the time the instructions were given for the guidance of architects entering for the premiums. The Town Clerk anticipated that the new department would require quite as much if not more room than that of the borough engineer and his staff, and said there were many other matters to be taken into account if the buildings were to cover the needs of the town for the next ten to twenty years.—Councillor Fox and Alderman Beavan said they understood that the new buildings had been designed to meet the town's requirements for nearer half than a quarter of a century.

THE Town Clerk went on to say that there was no larder or wine room attached to the banqueting hall, that there was need of a separate kitchen and dining room for the clerks, that the judges would require a luncheon room in addition to their separate

retiring rooms, and that there was no accommodation shown for the clerk of assize, for the clerk of the peace, for the post-office, or of a central telephone exchange. Mr. Lanchester, a member of the London firm who secured the premium, was in attendance, and after saying that it was possible to throw out two wings without materially affecting the symmetry of the design, dwelt on the desirability of having the whole of the requirements arranged for in the plans before the first stone was laid. The committee asked Mr. Lanchester to re-arrange the rooms so as to provide all the accommodation suggested, and to present the amended plans at the next meeting. Councillor Fox pointed out that while he was prepared to vote for every reasonable provision being made now, he disagreed with the idea of a separate kitchen and dining-room for the clerks. He advocated the establishment of a municipal refreshment room, where the public attending the law courts and members of the Corporation could be provided for, as well as the officials and their staffs. On the recommendation of the architects, Messrs. Young and Brown, of Southampton Street, Bloomsbury, were engaged to draw out the quantities.

An interesting relic of old Newcastle has recently been sold. But it has not been sold in order that it may be demolished, or even that it may be devoted to a purpose other than that which it has fulfilled for nearly four hundred years past. It is the old Black Bull Inn, in the High Bridge, which is said to be one of the oldest licensed houses in Newcastle—as, indeed, it must be, if the records be accurate. The property of which the old hostelry forms the main part is an extensive one, covering, with the shops and warehouses adjoining, a considerable area near the corner of the Bigg Market and High Bridge, with an entrance from each of these thoroughfares. The date of the setting up of the inn is there, on the signboard, for all people to read. "The Black Bull," it says, "Established 1530."

The old Black Bull was a famous house in the coaching days, before trains and steamboats brought people into the town. The front of the inn was not then flush with the street as it is now. There was a courtyard in front, of considerable area, and at one side there were commodious stables for the reception of the coach horses. The coaches coming from both the north and the south drove into the Bigg Market, and swept round into the courtyard, and the passengers were hospitably entertained within. Now the courtyard is covered with buildings. One part of the new buildings was erected as an addition to the hostelry, which has now, therefore, two bars—the old place being the back bar, and the new room the front bar; and they are connected by a covered passage, bringing them both practically under one roof. On the other part of the courtyard a shop was built. The old stables have been transformed into warehouses. Passing behind the newer buildings into the passage beyond, one can readily see that the place is of great age. The old house must have been a fine range of buildings in its time. Inside the old bar itself—the taproom of the Black Bull—there is still a decided smack of antiquity, although it has long since been renewed. A shelf is withdrawn, and one sees the great fireplace, very high, and wide, and deep.

In a leading article the other day, the Daily News voiced a real risk involved in the "cheap facility of the snapshot camera." The camera is prone to supersede the sketch-book, and in many instances with damaging results. "But now that we have sane teaching, and a considerable opening for 'design,' and a comparatively favourable state of public taste and opinion," says our contemporary, "a deadly danger threatens us. Any fool can take a snapshot; and myriads do. That is infinitely swifter and simpler—cheaper, in a word—than even the slightest personal note. Is it not much to be feared that even the children in whom we have trained eyes and hands to a very tolerable point, and in whom a certain observation of nature and a certain love of

beauty has begun to bud, will spoil it all when they arrive at the years of indiscretion, by exchanging the sketch-book for the camera?"

"It used to be supposed that the capacity to draw even a fairly probable flower was wonderfully rare, and that it was almost a mark of genius to be able to make a serious sketch. And, in fact, while our methods of teaching were bad, it did require some natural gifts to surmount the curious obstacles which were carefully placed in the pupils' way. But the supposed rarity of the power to draw is quite imaginary. All children, with a little encouragement, will try to draw. It seems to be a natural development of their devouring zeal for imitation in every form. Moreover, there are probably few bright children, if there are any, who cannot, with a little pains and patience, be got to draw simple objects from Nature with very passable truth. At the outset, no doubt, they will fall into the fallacy of trying to draw not what they see, but what they think they ought to see. A table has four legs: therefore, if they draw a table they must put in the four legs somehow, even if they have to stick the furthest one in any comic and impossible position.

"But once they have been persuaded that what they have to do is only to put on paper what their eye actually do see, and have been shown in a few simple cases what that is, and how they may seize the more characteristic points in it, then they can almost teach themselves. The very fact that their drawings grow visibly better under their eyes is a delight to them and a stimulus to further efforts. Children who hate to draw generally hate it for the very proper reason that they 'cannot make the things come like.' The moment they see a chance of realizing the delights of artistic reproduction they are just as keen about it as more gifted persons—since the desire to imitate, for some mysterious reason, is inborn in the race, and the instinct that makes it amusing to draw the outline of a beast is as old as palæolithic man.

"It will be a thousand pities if either cheap photography or the devouring claims of bread-and-butter designing should kill down the wider chances which the growing generation has at last obtained. Of us who are older, few had any decent chance of learning to use a sketch-book intelligently unless we got it after our school days were over by special trouble. The school children of the present ought to be able with great ease to draw an animal or a plant, a cottage or a landscape, whenever they choose. They will probably be glad enough to do such things for recreation on rainy summer days, if their elders have the sense to put them in the way of it. They will gain by it not only an intelligent pleasure, but also that intimate familiarity with Nature which, in a civilised and hurrying generation, it is so woefully easy to lose. And they will help insensibly to make the cultured public opinion in which alone it is possible for real Art to live."

THE St. James's Gazette is anecdotal in commenting on affairs at South Kensington. An eminent authority on Architecture, it relates, was once consulted as to what was to be done with the memorial church erected to a distinguished person. It had fallen into a bad condition, and needed repair. The eminent authority examined the masterpiece, and then cheerfully gave his opinion that it was bad as building, and so hideous as art that there was nothing to be done with it except pull it down and build something better in its place. He did not know, what, however, was the case, that the church had been built by the family from the designs of the distinguished person himself, who was by way of being an amateur architect. His advice, it is needless to say, was not taken.

THE picture sale season just concluded has, as we have already recorded, been relatively uneventful. True, a very decided appreciation has taken place in the auction value of outstanding works by Rossetti and the late

Sir Edward Burne-Jones, and Millais's "Order of Release" made as high a sum (5000 guineas) as has ever been paid for a work by him. On the other hand, no sensational prices can be recorded for examples by British portraitists, nor have any canvases comparable in importance with the four Turners, which in the Pender sale of 1897 brought over £30,000, come under the hammer. Moreover, instead of thirty-two pictures, as was the case last season, having been knocked down for 14,000 guineas or upwards, no more than sixteen dispersed since January 1st reach or exceed this limit. Of these three are by foreign masters, four by British portraitists, and the remaining nine, including "The Mirror of Venus," the "Chant d'Amour," and "Love and the Pilgrim," by Burne-Jones, may be classed as subject pictures by native artists.

LONDONERS, or as many of them as are compelled to pass along the Strand, have just entered into the delirious excitement of the "up" season. From Exeter Hall to Agar Street the thoroughfare in question will be closed to vehicular traffic for ten days to a fortnight. Already there are unmistakable indications that the public is in for an exceptionally interesting time, and the vestries will, as usual, see that no stone or wood block is left unturned to provide an annual entertainment that will be quite up to the average. In preparation for the opening performance huge stacks of creosoted cubes have been set up on the northern sidewalk of the Strand, and as soon as the supply is complete, the pickaxe fiend and the wheelbarrow man and the person with the shovel, and the dude in corduroy who leans up against the scaffold pole fence, and the rest of them, will be in evidence once again. At present the indications point to a quiet "up" season, but as the asphalters have already taken possession of one half of Queen Victoria Street, down near the Bank, and most of the western Strand is to be closed next week, to say nothing of "a few small jobs" in other parts, there is no reason for despondency.

DEATH has removed of late several architects who have aided to embellish Paris by their buildings. M. Deperthes, whose name will be associated with the present Hôtel de Ville, has to be included among them. He died at Rheims, the Architect announces, in the sixty-fifth year of his age, and his recent plans prove that his skill in designing had not lost its power. The majority of the prominent Parisian architects are natives of the capital, but M. Deperthes was born in Houdilcourt, in the Ardennes, in 1833. He was an assistant of M. Ballu when the competition for rebuilding the Hôtel de Ville was arranged, and co-operated with him in the preparation of the design which found acceptance, and which resembled the former building. His designs were awarded medals at the Salon and other exhibitions, and M. Deperthes well deserved the esteem in which he was held.

ARRANGEMENTS are being made by the London School Board to send examples of the art work of some of the best pupils in their schools to the forthcoming Exhibitions in Madrid and Paris. Certain of the children have shown remarkable artistic ability, not as mere copyists, but in original designs, and the result has amply justified the authorities for taking up this branch of education.

THE inhabitants of Chew Magna, a little village in north Somerset, thought it would be a good way to celebrate the Record Reign by having their peal of cracked bells recast and rehung. Recently the new bells were brought to the village, and in due time successfully hoisted into the historic tower, the old oak beams being replaced with iron. When the ringers tested the ropes, it was discovered that the strength of the tower had not been taken into consideration, and the unwonted agitation of the flagstaff speedily attracted the attention of the bystanders below. As a consequence, the bells will have either to be rehung, or the temperament of the tower consulted.

GREAT ART WORKERS OF THE CENTURIES.

JACQUARD: TEXTILE ART WORKER.

DOUBTLESS the earliest forms of clothing were the skins of beasts with the hair or wool upon them, though it is even probable that anteriorly the leaves of plants were employed wherewith to cover nakedness. In warm climates, however, people would desire something lighter than animals' skins, and there is but little doubt that the plan of crossing and interlacing fibres so as to produce a fabric was discovered at a very early period. We know at least from the dredging of the Swiss lakes that the *ante-historic* man produced mats by this system of interlacing, because fragments of these have been fished up. Coming to the historic period, Egyptian mummies have been disintombed wrapped in textile cere clothes which must of necessity be several thousands of years of age. This fact, of course, proves also the great antiquity of the loom, for, although the mats made by the primitive man might have been laboriously plaited by his squaw while he himself was indulging in the pleasures of the chase, yet the fine linen

TEXTILES OF THE ANCIENT EGYPTIANS

could not have been so produced. The loom as an invention capable of producing a fabric having "warp" and "woof" is therefore, in all probability, at least 4000 years old. Doubtless the extremely simple species of looms found to-day in India and other portions of the East are veritable survivals of the primitive weaving apparatus. It is pretty clear that the cocoon woven by the caterpillar or the silkworm (*bombyx mori*) was very early utilised as a fibre to be woven into regal or princely garments. It might fairly cause surprise that a material so fine as silk could be woven in such rough and clumsy looms as those of antiquity must necessarily have been, did we not know that on their miserable and cumbersome looms the Hindoo weavers of the present day at Dacca and other parts of India can produce the most beautiful and delicate fabrics. It is abundantly evident from ancient authors that silk textiles are of very great antiquity. The Median robes spoken of by the Greek writers of the period of the Persian Empire, and extolled for their lustrous beauty and brilliancy, were doubtless silken vestments. Aristotle is the first Greek author who mentions the silkworm, and he states that the silk was first spun in the Island of Cos, but the raw material was still an Oriental product. Pliny states that the silk came from Assyria, and was worked up by the Greek women. Anent this the author of the article upon "silk" in the Encyclopedia Britannica remarks: "Pliny, whose judgment and discrimination as a compiler are not to be relied upon, reports that the *bombyx* (or silkworm) is a native of Cos, an island

IN THE MEDITERRANEAN ARCHIPELAGO.

It is known that silk was manufactured there at a very early period; but Aristotle had previously explained that *bombykia*, or the stuff produced from *bombyx*, was re-grown or woven by the women of the above island. The inventress of this process was Pamphilia; she unwove the precious material to recompose it in her loom into fabrics of a more extended texture; thus converting the substantial silks of the Seres into their transparent gauzes, obtaining in measure what was lost in substance. Attempts have been made to rob the inventress of all the merits belonging to the process, by identifying the *bombykia* with the raw material, which, it is said, Pamphilia and her nymphs procured from Seres, and thus spun or wove into *serica* or silk. But the fact of reweaving rests upon too good authority to be doubted. It is probable that silk was in use among the Greeks long before they knew whence the substance came, or in what manner it was produced. Virgil supposed that the Seres (Chinese) carded the silk from leaves,

and Dionysius Periegetes also supposed it to be a vegetable product. Thus he says:

Nor flocks nor herds the distant Seres tend;
But from the flow'rs that in the desert bloom,
Tinctur'd with varying hues, they cull
The glossy down, and card it for the loom.

But Pausanius appears to have been aware that silk was produced by an insect. Still, both the raw material and the manufactured product were imported into Europe from the East until the time of the Emperor Justinian, the trade being principally in the hands of Persian merchants when the importation was entirely discontinued. "The trade in silk," says Mr. Timbs, "was in this unsatisfactory state when two Nestorian monks of Persia, who had travelled to China, there saw the common silken dress of the Chinese, and the myriads of silkworms on trees and in houses from which it was obtained. On their return to the West they acquainted Justinian with the mode of producing silk, and undertook to return and bring back with them some of the eggs of the silkworm. This they did, and a quantity of eggs concealed in a hollow cane were brought in safety to Constantinople, and there hatched, and fed with mulberry leaves. These worms in due time spun their silk, and propagated, under the careful attendance of the monks, who also instructed the Romans in the whole process of manufacturing silk." From that time onward, silk was woven in Europe. Commencing in Greece, the art of rearing silkworms and manufacturing silk was transferred to Sicily in the twelfth century, to Italy in the thirteenth century, thence to Spain, to France during the reign of Francis I., and finally the weaving to England

IN THE FIFTEENTH CENTURY.

The rearing of the worms and the production of the raw material have never taken root here owing to faulty climatic conditions. From the first introduction of the art into France, the French workmen have excelled as silk weavers. Lyons has always been the headquarters of the French silk manufacture, and Jacquard, the subject of this brief notice, was a native of that town. In plain silk weaving, the process is much the same as in weaving linen or woollen, but the weaver was assisted by a machine for the even distribution of the warp, which frequently consists of 8000 separate threads in a depth of 20 in. Joseph Marie Jacquard's claim to rank as an art worker is based on the fact that he invented a plan by which the most beautiful and elaborate designs in silk weaving could be simply produced by mechanical means in place of a hand, clumsy, and difficult process. Jacquard was born at Lyons, in France, on July 7, 1752. His grandfather was

A STONEMASON OF CUZON,

and his father was a weaver of stuffs, at which occupation the boy early learned to assist. During this period he gained the rudiments of a simple education, so far, at least, as writing and arithmetic went. His health, however, proving delicate, young Jacquard was placed first with a bookbinder, and afterwards with a typesetter. At this time the boy's mind was teeming with mechanical inventions of a useful character. When he had reached the age of twenty his father, who had come into a small property, commenced business on his own account as a weaver; but he failed, and, despite the heroic efforts of Madame Jacquard, the family could scarcely obtain even food. In 1790 young Jacquard conceived the idea of a machine which should achieve certain important processes in weaving, but his poverty prevented him from taking any steps to work it out. Two years later a copy of the "Poor Richard's Almanack" of Benjamin Franklin, the celebrated American printer and Statesman, fell into the young man's hands. The precepts of thrift and industry therein contained sank into the mind of the young Huguenot. He laboured indefatigably, and at last succeeded in producing a perfect machine, for which the jury of the Exhibition of Industry of 1801 awarded him a medal. In 1804 the great medal of the Society for the Encouragement of the Sciences and Arts was also granted to Jacquard, and, finally, by Imperial decree, he received a pension of 3000 francs per annum. W. N. B.

BUILDING CONTRACTS.

AN IMPORTANT DECISION.

SHERIFF BERRY has just issued an important judgment in the Appeal Court at Glasgow affecting building contracts. The action was brought in respect of the fall of property in the New City Road, Glasgow. The Sheriff Substitute (Strachan) found that the collapse of the building was caused by the negligence and want of skill on the part of the pursuers, after the contract had been given up by the defender, in placing three columns supporting the longitudinal beams on which the upper stories principally rested on a retaining wall of common rubble masonry, which was entirely insufficient for the purpose, and by failing to put in certain supports. The Sheriff Substitute therefore assoiled the defender, with costs. On appeal, the Sheriff adhered to the interlocutor of the Sheriff Substitute, and gave additional expenses. The following is the note:—A consideration of the full argument I have had in this case, and of the proofs and productions, leaves no doubt on my mind that the conclusion of the Sheriff Substitute is the right one. It seems to me impossible to hold that

LIABILITY FOR THE FALL

of the pursuers' building has been brought home to the defender. The connection the defender had with the building is explained in the Sheriff Substitute's note, and I need not recapitulate what is said there. The connection was very short. After the ground had been excavated he proceeded under a contract with pursuer to lay a concrete foundation for the contemplated building and to build the lower walls. When, however, it had been proceeded with but a short way a difference in regard to payment arose between the parties; the defender gave up the contract, and the pursuer himself took up the work and went on with the building. At the time (May, 1896) when the pursuer took the building into his own hands, the area wall had been built as well as part of the back wall. On November 30th, when the building was nearly completed, the chimney heads having been erected and the slating in course of being finished, a large portion fell, and for that fall and its consequences the pursuer seeks to hold the defender liable.

THE GROUND OF LIABILITY

on which the pursuer relies is the allegorical responsibility of the defender for the foundation of what is called the east cube butt, which certainly had an important relation to the stability of the eastern portion of the building, which ultimately fell. The defender had left the building before the construction of the butt was commenced, but he had had the laying of the concrete for its foundation, and it is said that the composition of the concrete used by him was not in accordance with contract, and was defective and weak; and that it was not evenly and properly laid, the result of these defects being, it is contended, that the foundation cracked, the butt tilted to the side, dragging with it certain iron columns with which it was connected, and causing the structure to collapse. On the question as to the composition or quality of the concrete there was not much argument addressed to me, and, indeed, I doubt if that part of the case is seriously relied on. At all events I think it enough to refer to the full explanation regarding it given in the Sheriff Substitute's note. I concur in his conclusion "that the pursuer's allegations as to the defective quality of the concrete are entirely disproved." I hold that the fall cannot in any way be accounted for by insufficiency of the concrete. A more serious argument was rested on the mode in which it was said that the concrete had been laid by the defender. It was laid in two courses, and according to a sketch, No. 18, produced by Mr. Foreman, who appeared as a skilled witness for the pursuer, the upper layer was not placed evenly above the lower; the centres of the two did not correspond, and the butt was built so as to rest for the most part on the upper layer alone, a small portion only

resting on both layers. According to this sketch a large crack or rent appeared under the butt, which, it is said, had had the effect of tilting the butt and causing the ruin which followed. In considering how far the appearance presented in this sketch is to be relied on, one has to contrast it with another, No. 17, also prepared by Mr. Foreman, and produced at a previous stage of the case. This previous sketch or plan corresponds much more closely with a pencil sketch subsequently made on the spot by Mr. Bryden, an architect adduced for the defender, than it does with No. 18. According to Mr. Bryden's sketch as much as

SEVEN-EIGHTHS OF THE BASE

of the butt rested on the place where there were two layers of concrete, and only an eighth on the part where there was a single thin layer. Again, this sketch shows no crack as there appears on Mr. Foreman's second plan, No. 18, the only crack shown being beyond the base of the butt, and such as in all probability would be caused by the impact of heavy material when the fall took place. The accuracy of this sketch of Mr. Bryden has been accepted by the Sheriff Substitute, and, I think, with reason. His reference to the witness Gascoigne as giving independent support to it has been adversely commented on in the argument for the pursuer, on the ground that Gascoigne left the job when the defender left it, and that he cannot, therefore, have been present when the building of the butt was commenced, as he says, at a place 3ft. out of the position originally intended for it. I am not sure that this criticism on his evidence is effectual. The placing of a thin layer of cement by order of M'Kinlay and Scorgie, in the absence of the defender, as described by him, may have been done immediately before the defender left, and he may have been told that the butt was to be built in the altered position. But, however that may be, and whether or not reliance be placed on Gascoigne's evidence as corroborating that of Mr. Bryden, I regard it as clear from the proof that the

FOUNDATION OF THE BUTT

had not sunk or been disturbed, but remained level up to the time of the fall, and indeed afterwards. Mr. Bryden made a careful examination of the place on 4th January, and he tells us that while the butt itself was off the plumb, "the foundation of the butt (and we examined it with the greatest care) showed no signs whatever of any subsidence. It was not the foundation that had gone off the plumb, because I plumbd it." The deflection from the vertical of the butt itself here referred to was to the extent of some 5in. or 6in. That, however, was in all probability caused by a drag when the building fell, and there is evidence which I regard as quite satisfactory that it was in no respect a cause of the fall, even if it had arisen from a defect in the foundation, which, in my opinion, was not the case. Mr. Whyte, the Minister of Works for the city, who examined the building officially when the fall was reported to him, said, in answer to the Court:—"Supposing it was

LEANING OFF THE PERPENDICULAR

in consequence of the weakness of the foundation, I do not think that would have been sufficient to account for the collapse of the building." There is other evidence of a similar nature which places it, I think, beyond doubt that it was in no degree to the butt being off the plumb that the fall of the building can be attributed. That, I think, is enough to relieve the defender from liability. What it was that caused the fall it does not lie on the defender to show. But if a conjecture is to be hazarded, I think the two causes assigned by the Sheriff Substitute may be regarded as having materially contributed to it. The three columns specially referred to in the course of the case were made to rest on a rubble retaining wall, and notwithstanding the opinion regarding the sufficiency of that support, strongly insisted on by Mr. Foreman, the weight of authority is, in my view, contrary to his opinion. Then

THE OMISSION OF SUPPORTS

shown on the plans submitted to the Dean of Guild Court until a very late stage in the

building may well be held as having been a grave cause of weakness. For weeks before the fall, cracks and other signs of yielding had appeared both in the back and front, and in particular at the close towards the east end, which pursuer kept open for use as a cartway. Supports for the stair and at the entrance to the close were left out, and it was only a day or two before the fall that an attempt to prevent the catastrophe then imminent was made by providing support of a temporary kind. The Sheriff Substitute has commented, and I think with justice, on the want of trained skill on the part of the pursuer, who took in hand the construction of this building, with the aid of persons who had little, if any, better qualification for the work than himself. The tenement was of delicate stability, and required the careful application of skilled knowledge to see to its safety in the course of construction. Of that skilled knowledge there was a conspicuous absence, and one is not surprised at the result. The attempt to saddle the defender with responsibility for the fall has, in my opinion, entirely failed.

KEYSTONES.

A NEW board school has been opened at Brynsiencyn, Anglesey.

A PUBLIC shelter has been erected on the South Cliff at Felixstowe. The outlay has been about £2000, and the contractor was Mr. Philip Banyard, of Felixstowe.

THE foundations for a three-story hotel, which is being built in Fore Street, Winkleigh, Devon, were laid last week. Messrs. Fisher Bros., of Northtawton, are the contractors.

EXTENSIVE alterations and additions have been made to the Shire Hall at Worcester, at a cost of £6500. The architect was Mr. Rowe, jun., son of the County Surveyor for Worcester-shire.

ALTHOUGH the city of Gloucester was at one time noted for its bell founding it had up to recently no church which could boast a full peal of ten bells. The peal of St. Michael's has been increased from eight to ten.

THE Catholic Chapel at Brynnyrn has been completed. The church will seat about 120, a new sacristy having been erected, in which a beautiful Gothic window has been designed, representing the Sacred Heart and the Immaculate Conception.

A PORTION of a house in North Street, Newry, collapsed recently, burying several of the occupants. The captain of the Fire Brigade and others rushed in to extricate the occupants, when another portion collapsed, burying the rescuers. One person was killed.

THE War Department's new torpedo factory at Gillingham, near Chatham, is now completed, and preparations are being made for equipping it with the requisite plant and machinery. The site of the old factory will be absorbed in the new naval barracks which are being built at Chatham.

THE Leominster Hospital Committee have decided to erect a new college hospital and nurses' home in South Street, Leominster, the accommodation allowing for five beds, and a separate building is provided for the matron and nursing staff. Mr. Ernest G. Davies, M.S.A., of Hereford, is the architect.

THE scheme whereby various parts of Liverpool are to be supplied with open-air baths is progressing satisfactorily. The one at Gore Street is now practically completed, and will be opened within the next few days; and it is expected that the baths at Mansfield Street and Green Lane, the work of constructing which is to proceed at once, will be in readiness for next season.

AN alarming sequel to the fire at Norwich occurred a day or two ago. The Edinburgh public house, situate at the corner of the block where the fire raged, had withstood the devastation on either side, and had been temporarily shored up. The adjoining buildings were destroyed, but the public house was not considered unsafe, and business was conducted as usual. The house, however, has suddenly collapsed, injuring two or three people.

Professional Items.

ABERDEEN.—Contracts have now been entered into for the erection of a new edifice for the Bon-Accord Congregational Church. The church will be entirely built of grey granite. It is of plain design. Mr. John Rust is architect. The contractors are: Mason, A. Thompson and Sons; carpenter, Leslie and Hay; plumber, John Thom; plasterer, James Stewart; slater, George Farquhar, jun.; painter, Mason and Son; ironwork, John Grant; heating apparatus, Shirras, Laing, and Co., Limited. The estimated cost of the church is about £4000.

BELTON.—The parish church of St. Peter, Belton, Rutland, after being closed for several months for restoration, has just been reopened. Standing on the slope of a hill rising off the main road from Uppingham to Leicester, the fabric is a stone building of the Decorated style, consisting of chancel, nave, south aisle, south porch, and square embattled western tower containing four bells. For many years the building has been in a dilapidated condition, the roof being unsafe, the west arch blocked, the porch much out of the perpendicular, while the windows on the north side had lost their tracery, and there was a west gallery obstructing the arch. The church was repaired in 1841, and it has now undergone internal and external restoration at a cost of £2000. Mr. W. Talbot Brown, Wellingborough, was the architect, and Messrs. Roberts Bros., Weedon, were the contractors. The east window and side window in the chancel have been filled with stained glass.

BIRKDALE.—The new church of St. Teresa, Everton Road, Birkdale, has recently been opened. The church is built from the plans of Messrs. Synnott, Synnott, and Powell, of Liverpool, in the Transitional style of architecture, of red Burnley pressed bricks, with red sandstone dressings. It will accommodate 600 worshippers, and the contractors were Messrs. Fairbridge and Hatch, of Birkdale.

CLOUGHTON.—In the course of a few weeks the memorial window which is to be erected in Cloughton Parish Church in memory of Sir Frank Lockwood will be completed and unveiled. The committee selected the design of Messrs. Atkinson Brothers, of Newcastle-on-Tyne, and the subject illustrated is the "Judgment of Solomon." In the centre light is a very imposing figure of the King in the act of giving judgment; it is draped in an underrobe of white, richly diapered with gold. On each side are the two mothers, one with the dead child at her knees, the other clasping her living child to her breast. A secondary figure is a soldier with drawn sword ready to carry into effect Solomon's award. The composition of the window is in some respects unique, the colouring is singularly rich and harmonious, and the drawing excellent.

COLWYN BAY.—The foundation stone of a new church at Colwyn Bay has just been laid, and the building, which is situate in Conway Road, and has been erected at a cost of £2800, will be a handsome structure when completed. The total cost of the land, building, and the furnishing and decoration of the interior, will amount to about £12,000. The style of Architecture is Gothic, and the building, which will be of stone, will afford sitting accommodation for 600. Immediately adjoining the church, but facing Brackley Avenue, a commodious presbytery will also be erected. The architect is Mr. R. Curran, C.E., Warrington, and the contractor Mr. Thomas Brown, Chester.

GREENOCK.—Messrs. Hardie and Thomson, Glasgow, have prepared plans in the Italian style of architecture for the new buildings which are about to be erected for the Clydesdale Bank on the site of the old White Hart Hotel, corner of Cathcart Square, Greenock. The building is to be three stories in height. The ground floor will be utilised as premises for the bank, the two top flats fitted up for offices, and the

extreme east portion set apart for shops. The cost will be £10,000.

HORFIELD.—A Wesleyan School chapel is being built at Horfield. The new buildings will consist of a large hall, and in the rear four class-rooms. On the first floor will be a room 24ft. by 20ft., used as a church parlour. The building will be in the decorated Gothic style, the walls of red pennant, with freestone dressings. The roof will be covered with green slates, and surmounted by a handsome flèche, rising 70ft. from Gloucester Road. The plans of Messrs. La Trobe and Weston, F.R.I.B.A., were selected in a limited competition, and the building is being carried out under their superintendence, Mr. E. Love being the contractor.

INWARDLEIGH, DEVON.—The restoration of the parish church of Inwardleigh, has been commenced by the contractor, Mr. S. G. A. Pethrick, the architects being Messrs. Tait and Harvey, of Exeter. The first section of the work comprises a new roof for nave, also a new south wall. The principal beams of nave were in a dangerous state, being quite rotten throughout. The other sections to be carried out are reseating and reflooring the tower and chancel.

KILPECK.—The interesting Norman church of Kilpeck has been reopened, after undergoing extensive repairs. The church is well known as one of the most valuable examples in England of the late Norman period, with an elaborate south doorway, chancel arch, and corbel table, profusely ornamented with those grotesques so characteristic of the period at which it was built. So recently as 1860 considerable repairs were done to the church, but for some time the roof had been defective, and the interior had suffered much from damp. Chiefly owing to the liberality of Colonel Windsor Clive, the church has now been put in a sound state, and at the same time every care has been taken to preserve every fragment of old work. A drain has been carried round the exterior, the old stone tile roof has been stripped and relaid, and felt has been introduced between the tiles and the boarding. The interior, which was much disfigured by a thick modern coat of plaster, has been carefully replastered so as to show the worked stone of the interior. No fresco painting was found, this having probably been destroyed in former years, but a small fragment of colour decoration was found on the north side of the chancel. The font, a very large Norman one, has been moved from its position in the centre of the chancel, where it was placed in 1860, to a position at the west end, near the south doorway. A thirteenth century memorial slab has been placed against the north wall of the nave. The repairs have been carried out by Messrs. Collins and Godfrey, builders, of Tewkesbury, from the plans and under the superintendence of Mr. Rowland W. Paul, architect, London.

LONDON, E.—Cardinal-Archbishop Vaughan has just laid the foundation-stone of a new church on a site between the Victoria and Albert Docks, at Custom House, E. It will be Decorated Gothic in style, and will be built of brick with Portland stone dressings without and Bath stone within. When complete it will accommodate 600; but at present only two-thirds of the structure will be erected. It is designed and will be constructed by Mr. R. L. Curtis. The sanctuary and side chapels will be approached by three polished marble steps from the nave and aisles, and the high altar, with its oak predella, will be elevated by three steps more. The altar is to be of Caen stone, standing clear of the sanctuary walls. The portion to be raised immediately will involve a cost of £3211. The interior woodwork of roof, floor, and seating is intended to be of pitch-pine. The dimensions measure from east to west, 120ft.; and 60ft. from north to south.

LONDON, S.E.—A new pavilion has been erected at the Oval, Kennington, S.E., which is one of the most elegant structures of its

kind in the country. All the old buildings were taken down with the exception of the large dining-hall, which has been enlarged by nearly one-half, and, with the new professionals' dressing and club rooms, forms the west wing of the new pavilion. The central portions contain, on the basement floor, spacious lavatories for the members, and under the club-room and bar, commodious storage premises. On the ground floor is the members' club-room, 60ft. by 26ft., overlooking the cricket ground, with a bar in the rear about 50ft. by 18ft., and at the west end of the club-room are the members' private and writing rooms. On the east side of the club-room are the secretary's offices. A wide corridor at each end of the club-room traverses the building and opens on to the stand in front of the club-room. The committee-room and members' dressing-rooms, with lavatory, bath-rooms, and necessary conveniences, are situated on the first floor, and spare dressing rooms are provided on this floor for playing visitors. In the east wing a comfortable ladies' cloak-room is provided adjoining the entrance to the side stands, and on the first floor the Press-room, with telegraph-room, lavatories, spare room, &c., *en suite*. Adjoining the Press-room is the scorers' box, and below the telegraph-room a printing office. The roofs of the central portion of the pavilion and over both wings are constructed with fireproof flooring, and upon these roofs are stepped "stands," affording an unobstructed view of the whole of the cricket ground. Accommodation for 2000 persons is provided on the roof stands, and those on the field level in front of the pavilion. Externally, the building is faced with red brick, relieved with Bath stone dressings, and the roofs to stands and over the committee and dressing rooms are covered with Broseley tiles.

MANCHESTER.—The institution known as the Charter Street Ragged School, Manchester, is to be considerably enlarged. The old building was erected in 1866, and its corner-stone was laid by that great philanthropist, the Earl of Shaftesbury. After its capacity had been tried for some twenty years, the committee resolved to make their work and their experiments more vigorous and bold, thus necessitating a new building. When the new building was erected in 1892, the old ragged school, which faces Charter Street, was left standing. The old school adjoins the newer part of the institution. It is now to be pulled down, and the ground on which it stands rebuilt upon. The newer school and girls' home, with the old school, occupy a small square bounded by several streets, and the committee have bought two cottages in Ashley Lane, one of the narrow thoroughfares which run at right angles from Charter Street and surround the square. These cottages will be pulled down for the purpose of the extension. On the ground now covered by the old ragged school, or rather on part of it, there will be built an addition to the newer school and the working girls' home. Part of the land will be appropriated to public use under the scheme for widening Charter Street, which, in the case of the proposed building, requires the building line to be set back some 15ft. The estimated cost of the extensions is £4600. The architects are Messrs. Maxwell and Tuke, of Manchester, and the work of erecting these additions is to be at once taken in hand.

The new Deansgate goods depôt of the Great Northern Railway Company in Manchester, the first portion of which has been opened for the reception of traffic, is an imposing engineering work. It will, when completed, be one of the largest, best located, and most conveniently situated depôts of the kind in this country. It adjoins the Manchester Central passenger station—the Cheshire Lines Joint Committee's station—of which the Great Northern is one-third owner, and it is bounded on the west by Deansgate, on the north by Peter Street, and on the south by Great Bridgewater Street, from all of which streets it has entrances. Starting from a junction with the four-track road which runs into the Central passenger station, the rails communicating with the new goods station are carried by a girder bridge over Deansgate, and

they enter the site of the depôt at a considerable height above the ground level. The approach road, which is about 300yds. in length, immediately spreads out into six tracks, carried on an upper floor supported upon steel stanchions, at the base of which stands a very large shed for use in loading and unloading trucks. Above this shed a warehouse of three more floors, 80ft. in total height, is in course of construction; and upon each side of the shed branch lines run down at a moderate gradient to the ground floor of the depôt, which, like the upper floor, is laid out with tracks and banks for the shunting, marshalling, loading and unloading of trucks. Thus the area of the site, which is nearly seven acres, is utilised twice over for the purposes of a goods terminus, whilst it also provides the foundation for very extensive warehouse accommodation. Arrangements have been made to light the depôt throughout with the electric light, which is a very great assistance to the working of city goods traffic, so much of it having to be done at night. A full equipment of hydraulic cranes and capstans is also provided. The whole work, which has many admirable engineering features, has been carried out by Messrs. Robert Neill and Sons, of Manchester, under the supervision of Mr. A. Ross, the Great Northern Company's engineer-in-chief.

MORLEY.—The new electric lighting works erected by the Corporation of Morley, from the plans of Mr. Hammond, at a cost of £21,219, were opened recently. The generating works are situated in the Corporation Street, between the new public baths and the corporation depôt. The buildings, which were designed by the late borough surveyor (Mr. M. H. Sykes), are placed on the south side of the land reserved for the generating works, and are so arranged that a considerable area of land is reserved for future extensions. The contracts for the buildings have been carried out by local firms, as follows:—Building and masons' work, Messrs. Newton and Asquith; joiners' work, Mr. D. Marsden; plumbers' work, Mr. Firth; plasterers' work, Mr. Wilson; slaters' work, Messrs. D. Thornton and Sons; painters' work, Mr. W. Lawton.

ROATH.—The Mayor of Cardiff has laid the memorial stone of a new station, which is being erected in Roath by the Great Western Company. The contract, which amounts to £15,000 for the erection of the new station, has been entrusted to the firm of Messrs. Mackay and Davies, of Cardiff, Newport and Pontypridd. The site selected is in Pearl Street, near Splott Bridge.

SHEPLEY.—A new chapel for the Methodist New Connexion body at Shepley is being erected, and Mr. J. W. Firth, of Oldham, is the architect. The building is to be constructed of stone, faced with Brighouse pierpoints and local stone dressings. The style will be Gothic, with a tower and spire and large tracery window in the front gable. The contractors are: Excavating, drainage, brickwork, and mason's work, Mr. Harris Wood; joiner's work, Mr. James Broadbent; slater's work, Mr. R. C. Fletcher, Oldham; plumber's and glazier's work, Mr. George Lindley; painter's and plasterer's work, Mr. Albert Morton.

WOKING.—The Albion Hotel, Woking, is about to be pulled down and rebuilt on an enlarged scale, from the designs of Mr. Clamp, of Woking. The new building will be set back some distance from the present frontage, and in order to allow of business being conducted during the reconstruction, will be erected in two sections. The first portion will consist of the general bar (44ft. by 18ft.), and the apartments for the working staff, and the second the hotel proper, comprising saloon and private bars, coffee room, smoke room, club, and commercial room, the latter whereof being 33ft. by 21ft. 6in. The new building will be faced with red Surrey or Somersetshire bricks with Ancaster stone dressings, and will be provided with all modern hotel appliances. The contract, exclusive of stabling (to be built later), has been let to Mr. A. A. Gale, of Woking.

Views and Reviews.

THE MANUFACTURE OF GLAZED BRICKS.

Exhaustive and practical, lucidly expressed, and in small compass, the manual upon this subject, by Mr. H. Ansell, is one of the most satisfactory technical works it has been our good fortune to read for many years. Every detail is entered into, every process explained, and *raison d'être* given, and this in the full and convincing manner only possible to the expert. By most architects and builders the manufacture of glazed ware is considered quite a minor matter, but it is full of pitfalls for the unwary, and for its successful accomplishment a vast amount of special scientific knowledge is necessary, combined with extreme care in manipulation. When the skill is present, the knowledge is frequently absent; hence the need for such a book as this, with its careful instructions and numerous reasoned formulæ, giving the constituents and properties of every kind of body and glaze known, with descriptions of the plant needed, the kilns to be used, and the temperature necessary to produce the best results with each. In fact, while interesting to all who have anything to do with glazed wares, this little work is absolutely invaluable to the manufacturer, and should find a ready sale even at what looks at first sight to be a prohibitive price. The only way in which it could now be improved would be by the provision of a really sufficient index.

"The Manufacture of Glazed Bricks and Glazed Sanitary Ware." By H. Ansell. Second and enlarged edition, entirely rewritten and revised. H. Greville Montgomery, 43, Essex Street, Strand, W.C. Small 8vo.; 7s. 6d.

THE WORKMEN'S COMPENSATION ACT.

Few short Acts of Parliament have provoked more attempts to explain them than has the Workmen's Compensation Act, 1897 (60 & 61 Vic., c. 37), for in many respects it is vague in itself, and runs counter to other Acts. Of these attempts one of the best is that of Messrs. Minton-Senhouse and Emery, who have written a treatise upon it, divided into chapters, of which each deals with one of its important features, such as "Persons Entitled to Compensation," "Contracting Out," "Compensation for Personal Injury," "Compensation on Death," "Procedure," "Compensation in an Action," "Medical Examinations of Workmen," and "Duties of Committees and Arbitrators." Each of these points is most carefully considered, but, as the authors point out, there is considerable opening for litigation under the Act, which in this respect is highly unsatisfactory, and there will be much difficulty in arriving at decisions which will meet the needs of abstract justice. In a series of appendices are given the Act itself and its schedules, together with various forms of notices, claims, agreements, and awards, all of which should prove of the greatest value to those interested, especially as the book has a most complete index.

"The Workmen's Compensation Act." Edited by R. M. Minton-Senhouse and G. F. Emery. Crown 8vo. Price 1s. nett. Bemrose and Sons, Ltd., 23, Old Bailey, and Derby.

MOUNTS AND FRAMES.

The Rev. F. C. Lambert is well known amongst amateur photographers as being acquainted with all sorts of little dodges for the improvement of a photograph, and as being always willing to impart his knowledge to others in a pleasant and easily understood way; but it is a little difficult to see at first why his little book on "Mounts and Frames" should have been sent to a building paper for review. Perusal, however, shows that many of the hints given would be of value to any draughtsman, while the notes upon colour are of even wider application, and could be read with profit by many a designer, even if much that is said be to him but reiteration of well-known laws. Small as it is, however, the book needs an index sadly.

"Mounts and Frames, and How to Make Them." By the Rev. F. C. Lambert, M.A. Crown 8vo.; price 1s. Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill, E.C.

Enquiry Department.

FUMIGATING OAK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you give me information concerning the methods used to stain wainscot, joiners' and cabinet work?—1. Is this stain done by sealing up the work to be stained in a room, or is it done in a properly built airtight room specially used for fumigating? Can the work be fixed—say if dado, or staircase, or doors—first, then the room properly sealed up or fastened up a time, and fumed? 2. How is the ammonia used, and what quantity would be wanted? In what form is it used, liquid or lump? 3. Would wainscot have the same colour if the spirit of ammonia was used, rubbed on with a piece of rag? 4. How is wax polish made and used to obtain a dull effect?—Your constant reader,

"ABERDEEN."

The process of staining oak, by exposing it to the fumes of spirits of ammonia, is superior to that of staining by the direct application of the raw spirit to the wood, for two reasons: first, it is less harmful to the operator and all in the immediate neighbourhood; second, the colour obtained is more mellow, regular, and natural. The method is as follows:—The work is finished off at the bench, and every trace of oil or glue removed from the surfaces; a chamber or box is then prepared to receive it. All that is necessary in either case is, that it shall be air-tight, the latter is the more usual, and is simply a rough packing-case of a size large enough to contain the largest piece of framing to be stained, well nailed together, the side joints glued, and a loose lid provided. If possible the case should be arranged so that the work may be stood upright, as the tone then will be more regular. Blocks should be nailed at the ends of the case to keep the work about 1in. apart, and all joints and crevices covered on both sides with strips of brown paper pasted on. The work should now be adjusted in the case, and handled with clean rags or shavings, or the finger-marks will show, and the spirit (pure spirits of ammonia) placed at the bottom in two or three shallow vessels—such as saucers, which must be of glass or enamelled earthenware—and the lid quickly closed and screwed down, the joint being luted with brown paper as before. It may now be left a time, varying from four to twelve hours, according to the depth of tone required (which must be found by experiment), then taken out and touched up where required with raw spirit carefully applied with a pencil. If any sapwood be present the stain will have no effect upon it, and this will have to be coloured with French polish to match. To your second query, it would be practically impossible to so seal a house as to be able to fume a staircase dado in position; besides the quantity of spirits required would be out of all proportion to the work, and all paint metals and gilding in the place would be attacked. 3. The quantity used is not so material as the time the work is exposed to the fumes—half-a-pint will do for one, or 50 square feet, according to circumstances. 4. As mentioned above, the application of the spirit to the wood gives a harsher and less natural colour. 5. To make wax polish, melt crude beeswax over a close fire, or in a water bath (be careful not to do it at an open fire), and whilst it is liquid add sufficient turps to make it into a thin paste when cold; this is to be rubbed freely into the work with flannel rubbers, the superfluous wax removed with a linen rag and allowed to stand for two hours; it can then be polished by rubbing vigorously with a flannel rubber. The height of the polish is regulated by the rubbing; if a dull finish is required rub slightly.

ROUGH CAST.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you, through your "Enquiry Department," inform me of the ingredients of a rough cast, such as one occasionally sees on

old Yorkshire cottages, by which I do not mean a pebble dash, but a really rough plaster surface, finished a cream tint all over? I believe it is made with a coarse gravel, but perhaps you can tell me. Also, would it make a firm and permanent job to plaster it right on to brickwork, or would it be necessary to batten and lath for it, and is it necessary to paint it?—Yours faithfully,

H. M. C.

Such a surface as mentioned could probably be obtained with a plaster formed of two of clean gravel to one of Portland cement, coloured with yellow ochre to taste; a little white copperas added in the mixing will prevent the colour washing out. The coarseness of the surface may be regulated by the mesh of the screen when screening the gravel. Battens are not required; rake the joints well and hack the face of the wall. If the walls are not yet built, run them with lines only, the rough surface will afford a good key. Avoid paint, it is expensive and unsatisfactory; incorporating the colour with the cement is much the better way. Any of the ordinary oxides of lead or iron will do.

GRADIENTS

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you please show by workings the method of calculating the gradients of roads and sewers? The lengths and falls being given, as, say, 700ft. length, 9in. fall, what is the gradient? And could you state what is considered the flattest gradient for 9in., 12in., and 15in. sewers respectively?—Yours, &c.

A. R.

To ascertain the gradient reduce the given length to the same denomination as the given fall, and divide the former by the latter, the quotient will give the ratio of fall in 1; for instance:—

$$\frac{700\text{ft.} = 8400\text{in.}}{8400} = \frac{\text{a fall of } 9\text{in.}}{933.3} \text{ in } 8400\text{in.} = 933.3, \text{ or expressed } 1 \text{ in } 933.$$

The flattest gradient for general purposes for sewers of 9in., 12in., and 15in., when running half full bore is, 1 in 90, 1 in 120, and 1 in 150 respectively; but so much depends on circumstances, the nature of the sewage, the regularity of the flow, &c., that the question is hardly capable of a general answer.

Under Discussion.

CHURCH RUINS IN IRELAND.

The Architectural Association of Ireland recently had an excursion to Glendalough. The ruins of the famous churches in connection with the once world-renowned seat of learning, the ancient University of Glendalough, were visited by the party. The so-called "Kevin's Kitchen" and St. Saviour's Church are the best preserved of the ancient glories of the place. The former building is a rectangular chamber of characteristically Irish construction. Its origin and use are still undetermined. Most people nowadays hold to the theories of Dr. Petrie, backed, as they are by the weight of his pre-eminent authority as an archaeologist. But still the older school of antiquaries, who assign to such remains of early Irish Art a much more ancient date, attributing them to Pagan times, has many adherents. One suggestion is that "Kevin's Kitchen," with its round tower-like superstructure, was the fire-chamber of some mysterious religious rites akin to the Buddhist, or pre-Buddhist ceremonies known to have been practised in the East. That the very early history of Ireland had much in common with the East in regard to its extremely early civilisation and Art, appears more apparent day by day. Nevertheless, the dictum of Petrie to-day holds the field as far as the majority of people are concerned. The members dined together in the evening. The president, Mr. J. Howard Pentland, R.H.A., presided.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ASHTON-IN-MAKERFIELD (Lancs).—For the construction of water supply works, &c., for the Urban District Council. Mr. J. W. Liversedge, waterworks engineer, Bryn-street, Ashton-in-Makerfield:—

Newton Chambers	£1,400 0 0	Merton and Co., on behalf of Wood and Co.	£1,385 8 6
Stanton Iron Works	1,411 0 0	Cochrane & Co., Dudley	1,375 10 9
G. & J. Staveley and Co.	1,406 8 9		* Accepted.
Thompson & Co.	1,404 17 7		

BELFAST (near).—Terrace of five houses:—
Wm. Nimick £2,729
Campbell and Lowry 2,595
Grainger Bros. 2,900
* Accepted.

BOURNEMOUTH.—Accepted for alterations and re-decoration of "Sandykeld," Manor-road, for the Rt. Hon. Lord Vernon. Mr. G. A. Bligh Livesey, architect:—
F. T. Cutler £320

BRAINTREE (Essex).—For the erection of house and two cottages, for Mr. H. Calver. Mr. J. W. Clark, architect, Coggeshall, Essex:—
Silas Parmenter £895 0
J. Smith and Son, Witham £798 10
* Accepted.

BRISTOL.—For extensions to school, Greenbank, for the School Board. Mr. F. Bligh Bond, architect, Alliance-chambers, Corn-street, Bristol:—
Keen and Keen £2,085
J. Hatherley £1,937
W. J. Tanner 1,972
E. Walters 1,920
E. Clark 1,950
W. Church 1,887
* Accepted.

J. Wilkins, Bristol* £42
[Four others tendered.]

BURTON-ON-TRENT.—Accepted for the erection of a rector house, &c., at gasworks, for the Corporation. Mr. F. L. Ramsden, engineer, Town Hall, Burton-on-Trent:—

J. T. Farlow, Burton-on-Trent	£2,395 19 4
Gough and Felgate, Burton-on-Trent	£589 13 6

CARDIFF.—For the erection of business premises, 31 and 32, High-street, for Mr. A. F. Langley. Mr. E. Jenkin Williams, architect, 14, High-street, Cardiff. Quantities by the architect:—

F. Small	£3,651 15 0	W. Thomas & Co.	£2,965 0 0
Newman & James	3,603 6 4	W. Bowers & Co.	2,963 10 0
Mainwaring and Davies	3,370 13 0	C. C. Dunn	2,909 0 0
J. M. Hockridge	3,150 0 0	C. Price and Son	2,899 0 0
D. Thomas & Co.	2,995 0 0	W. H. Ingleson	2,846 0 0
Knox and Wells	2,983 0 0	S. Shepton & Co.	2,840 0 0
Williams	2,969 0 0	E. Turner & Sons	2,668 0 0

CARDIFF.—For alterations to house, &c., at waterworks depot, Trade-street, Penarth-road, for the Corporation. Mr. C. H. Priestley, engineer, Town Hall, Cardiff:—

Williams & Thomas	£299 14 6	W. T. Morgan	£241 13 6
W. H. Ingleson	262 0 0	Cox and Bardo	237 1 4
E. Turner & Sons	251 6 9	C. C. Dunn	205 15 8
G. Griffiths	248 9 8	Blackier Bros., Llan-fair-road, Cardiff	193 12 0

CARDIFF.—Accepted for extensions to school, for the Paisley Landward School Board. Messrs. Kerr and

Watson, architects, Johnstone. Quantities by Mr. J. H. Bradshaw, Glasgow:—

Building.—J. J. Wardrop, Lochwinnoch	£1,138
Joinery.—Adam Kirk, Whiteinch	691
Plumbing.—C. Murdoch and Sons, Johnstone	189
Plastering.—Geo. Thomson & Son, Johnstone	101
Slating.—Geo. Thomson and Son, Johnstone	76
Tile-laying.—Thos. Main, Glasgow	86

CLEATOR (Cumberland).—Accepted for the erection of church room and caretaker's house, for the Rev. G. B. Amos, Cleator Parish Church. Mr. J. Stephenson Stout, architect, Gillford, Egremont:—

Masonry, &c.—Robert Pearson, Jacktress-road, Cleator Moor	£244 12 1
Plastering.—Robert Pearson, Jacktress-road, Cleator Moor	66 11 0
Slating.—Robert Pearson, Jacktress-road, Cleator Moor	115 18 0
Joinery.—John Martindale, Crossfield-road, Cleator Moor	198 3 0
Plumbing.—Jackson Sumpton, Market-place, Cleator Moor	46 10 0
Painting.—J. H. Tyson, Dalzell-street, Moor-row	10 15 0

CORSHAM (Wilts).—Accepted for new parsonage at Corsham Side, for Mr. G. P. Fuller. Mr. Harold Brakspear, architect, Corsham:—
R. Rudman, Chippenham £750

CRAWLEY (Sussex).—For extension of sewers at Crawley for the Horsham Rural District Council. Mr. C. H. Burstow, F.I.A.S., architect and surveyor, Horsham:—
Steer £425
Easton, Crawley* £335
Cook and Sons 345
* Accepted.

CRAWLEY (Sussex).—For shops and houses at Crawley, for Mr. M. Nightingale. Mr. C. H. Burstow, F.I.A.S., architect and surveyor, Horsham:—
Cook and Sons £1,699
J. Ockendon and Sons, Crawley (accepted) £1,659
Steer 1,696

CRAY (Brecon).—For the erection of a chapel for the Calvinistic Methodist. Mr. Rees Llewellyn, architect, Birchgrove House, Llanhamlet:—
Henry Jones £920 8
Thomas and Jones £897 0
William Jones, Cray, Breconshire* 900 0
John Jones 892 15
* Accepted.

DUNMOW (Essex).—For the erection of stables, carriage house, sheds, &c., Roughie, for Mr. O. Barnard. Mr. J. W. Clark, architect, Coggeshall:—
E. West £618 0
J. Smith and Son 544 0
A. W. Warren 500 0
T. A. Goodey, Dun-mow* £488 10
J. Pepper 483 0
* Accepted.

HOLYWOOD (near Belfast).—For erection of a villa, stabling, &c.:—
Wm. Nimick £1,093
Wm. Millar £2890
Campbell and Lowry 1,023
R. Ferris, Holywood* 790
* Accepted.

HOLYWOOD (near Belfast).—Erection of three houses:—
Wm. Neeson £590
Wm. Millar £435
R. Ferris 480
Grainger Bros., Holywood* 410
* Accepted.

HORSHAM.—For house at Eastlands, Billingshurst, for Mrs. M. Moore. Mr. C. H. Burstow, F.I.A.S., architect and surveyor, Horsham:—
Wadey and Sons £2910
G. Marden 798
J. Ockendon and Sons 780

HORWICH (Lancs).—Accepted for the erection of square brick chimney, 45yd. high, for Messrs. A. Mason and Son. Mr. E. W. Dyson, C.E., 17, Lee-lane, Horwich. Quantities by the engineer:—
Fairclough Leonard, Adlington, Lancs £364 2 10
[Six other contractors tendered.]

LONDON.—For alterations to saloon bar, &c., "Albany Arms," Albany-road, S.E., for M. C. Cook:—
Nash £460 0
W. E. Hill 371 10
Simpson and Cove* £239 0
* Accepted.

LONDON.—For pulling down and rebuilding Nos. 17 and 19, Hare-street, Woolwich, for Mr. J. Sackett. Messrs. Church, Quick, and Whinop, architects:—
Proctor £2,397
Ware 2,070
Kitley 1,930
Sandford £1,879
Thomas and Edge* 1,867
* Accepted.

LONDON.—For pulling down and rebuilding Nos. 40, 42, and part of 44, Hare-street, Woolwich, for Mr. J. S. Taylor. Mr. Percy H. Monckton, architect:—
West Bros., Rochester £4,515
Nightingale 4,224
Batey, Son, & Holness 4,045
Jerrard and Son 3,684
J. Greenwood 3,960
H. L. Holloway £3,947
Thomas and Edge 3,900
Harris & Wardrop 3,800
Turtle & Appleton 3,533

LONDON.—For the supply of dynamos and engines at the Northern Hospital, for the Metropolitan Asylums Board:—

	Dynamos and Spare Engines, Armature.
Ernest Scott and Mountain, Ltd.	£1,945
Clarke, Chapman and Co., Ltd.	1,775
Thomas Parker, Ltd.	1,891
Easton, Anderson and Gooldeen	1,651

CONTRACTS OPEN.**CIRENCESTER SURFACE WATER DRAINAGE WORKS.**

The Cirencester Urban District Council are prepared to receive TENDERS for the CONSTRUCTION of a system of SURFACE WATER DRAINS in a portion of their district.

The drawings and specification may be seen at my office, where copies of the quantities and forms of Tender can be obtained on payment of £1 ls., returnable if a bona-fide Tender be made.

Sealed Tenders, which must be on the proper form and endorsed "Tender for Surface Water Drainage Works," must be delivered at my office on or before THURSDAY, SEPTEMBER 1st, 1898.

The Council do not bind themselves to accept the lowest or any Tender.

By order of the Council,

Cirencester,
August 10th, 1898.

THOMAS HIBBERT,
Surveyor.

TO ARCHITECTS.

The Council of the Borough of Reigate invites COMPETITIVE DESIGNS for the ERECTION of MUNICIPAL BUILDINGS, FIRE STATION, POLICE OFFICES, &c.

Three premiums are offered, and the conditions of competition, together with a lithographed plan of the site, can be obtained on application to the Borough Surveyor.

All drawings to be addressed to the undersigned, and delivered at my Office, No. 84, Station-road, Redhill, not later than THURSDAY, OCTOBER 6th next.

By order,

CLAIR J. GRECE,
Town Clerk.

**BOROUGH of ROTHERHAM.
SEWERAGE AND SEWAGE DISPOSAL WORKS.**

CONTRACTS Nos. 1 AND 2.

The Corporation of Rotherham is prepared to receive TENDERS from competent persons for the CON-

STRUCTION of SEWERS, OUTFALL WORKS, and other WORK connected therewith.

The drawings may be seen, and copies of the specification, bill of quantities, and form of Tender may be obtained from the Engineer, Mr. R. E. BERRINGTON, Bank-buildings, Wolverhampton, on payment of Five Guineas, which will be returned on receipt of a bona-fide Tender.

The Contractor must not pay less than the standard rate of wages paid in the district, and must observe the proper conditions of labour, and no sub-contracting will be allowed except by permission of the Corporation.

Sealed Tenders, addressed to me, and endorsed "Tender for Sewerage Works, Contract No. 1 or 2," as the case may be, are to be delivered at my Office, Town Hall, Rotherham, at or before NOON on TUESDAY, AUGUST 23rd next.

The Corporation does not bind itself to accept the lowest or any Tender.

H. H. HICKMOTT,

Town Clerk's Office,
Rotherham,
July 12th, 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO,"
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

GAS-WORKS MACHINERY.*

By EDWARD ALFRED HARMAN, C.E.,
Gas Engineer to the Huddersfield Corporation.

(Continued from page ii.)

FUNCTIONS OF STOKING MACHINERY.

HUNDREDS of stoking machines are now giving entire satisfaction in London and the provinces, as well as on the Continent. By the rapidity of charging, the consequent saving of heat in the retort, and the even distribution of the coal inside the retort, an increased volume of gas per ton is obtained. There is also the more important consideration of a reduction in labour and cost of working. With the aid of machinery the coal is broken to a regular size, and is evenly charged throughout the entire length of the retort by the chargers. It therefore follows that a greater quantity of coal can be carbonised per retort than is the case with ordinary hand labour. Very important advantages accrue from the foregoing facts, inasmuch as they not only enable more coal to be carbonised per retort, and a greater volume of gas to be produced (due, as stated, to the even disposition of the coal), but there is also a considerable saving effected in capital expenditure on plant, due to the extra manufacture from a given retort area. This saving goes a long way towards recouping the capital expenditure employed on the machinery. The two principal systems now in use are the West, and the Arrol-Foulis. The machinery designed by Mr. John West, M.Inst.C.E., has now been in successful operation for about a quarter of a century. Mr. West's manual type of charging machine consists of a square upright frame on wheels, travelling on tramlines laid in front of, and parallel to, the retort bench. The machine is propelled by a hand wheel and gearing attached to one side of the machine, and on the opposite side there is another hand wheel and gearing for hoisting and unloading an adjustable coal hopper from one tier of retorts to any other. The adjustable coal hopper on the charging machine receives its supply of coal for a number of retorts from the overhead fixed coal hoppers, and is free to move vertically between the four uprights of the charging machine frame, being guided by them, and suspended by chains. A light frame is suspended from the coal hopper for carrying the charger when it is out of the retort. At the bottom of the hopper, but directly over the charger, is a feeder-box for supplying the charger with coal. The charger consists of a light carriage, running on three wheels, having two semi-circular scoops at the bottom. The scoops are arranged to turn over in opposite directions by the twisting of the long driving rod about half way round in one direction. It will be noticed that this manual charger is designed to charge half the length of the retort at a time, and goes in the retort twice to make a complete charge. A removable platform is used for working the top tiers of retorts. Mr. West's manual drawing machine is similar to the charger. With the manual machinery forty-five retorts can be charged and drawn as regular duty in forty-five minutes, and this without causing the men half as much fatigue as the ordinary hand labour work involves.

COMPRESSED AIR SYSTEM.

The compressed air system is the one now applied to Mr. West's power machines. After something like seventeen years' use of this power, the excellent working results have fully justified its use. Cotton and wire rope driven machines are at work with excellent results. The ropes are overhead, and are driven by a stationary steam or gas engine, fixed at one end of the retort house. These engines for driving stoking machinery are preferably arranged in a house detached altogether from the retort house, as it is most undesirable to have such engines working in dust and dirt, when avoidable. After numerous experiments with gas engines fixed on the machines themselves, it was found un-

desirable to adopt gas power at all, unless the engines were quite separated from the retort house, and it was therefore arranged to drive overhead ropes for the system, or to drive an air compressor for the compressed air system, only when arranged in buildings quite separated from the dust and dirt of the retort house. The air is compressed to the comparatively low pressure of 60lb. per square inch, and conveyed to the required machine by a flexible pipe, with connections and gearing so arranged that little, if any, attention is necessary from the attendant.

POWER MACHINERY.

The time taken for supplying the coal to the charger, and completing the full charge in the retort, averages 30 seconds per retort, or at the rate of say 120 retorts per hour. Taking the time from the commencement of a draw to the completion of the last charge, and bringing the machines back into place ready for the successive draw, these machines work 80 retorts per hour. Indeed this rate has often been exceeded. Before the power machinery was employed, the retorts were charged with $6\frac{1}{2}$ to 7cwt. of coal, which was carbonised in four hours and forty-eight minutes. The power machinery puts in 8cwt. per retort, which is carbonised in the same time as formerly, which equals about 16 per cent. increased weight of coal alone.

POWER CHARGER MACHINE.

The power charging machines are fitted with propelling gear, for travelling up and down the retort house. Each machine has an adjustable coal hopper, which is raised or lowered to suit the various tiers of retorts, by means of gearing worked by the same motor propelling the machine. The hopper is provided with a feeder-box, for regulating the weight of the charge of coal. The charger which enters the retort is carried in a frame suspended below the hopper, and is driven in and withdrawn from the retort by a compressed air cylinder rack and pinion, chain drum and chains. The charger consists of a scoop and carriage, containing the apparatus for emptying the coal out of the scoop and replacing it for a fresh supply. The scoop enters each retort twice for making a complete charge, first turning over in one direction and then in the other, thus throwing the coal towards the right and left-hand sides of the retorts respectively, which ensures the charge depositing evenly over the whole base of the retort.

POWER DRAWING MACHINES.

The drawing machines are fitted with travelling and hoisting gear, for raising and lowering the rake bar frame, carrying the rake bar and head to the several tiers of retorts. They are fitted with compressed air and controlling cylinders, rack and pinion chain drums, for the various operations.

AIR PIPES AND HOSE GEAR.

The air is conveyed from the receivers by iron pipes to the hose drums, fitted to the girders carrying the overhead coal hoppers. There is generally a large hose drum, complete with all fittings, for each of the charging and drawing machines. A long length of flexible hose is attached to each of these drums at one end, and at the other end to the machine supplying it. Each drum is provided with a hollow shaft, through which air is supplied, and by an arrangement of gun-metal swivel joints the air is supplied to the hose on the drums during their revolutions. On each of the hose drum shafts a chain drum is keyed, while a chain attached to this leads over pulleys into the retort house roof, having weights at the other end which rise and fall as the hose is automatically given in and out by the machine as required. The hose leading from the drums to the machines is specially designed for conveying air. It is supported at intervals by suspending brackets and rollers, so that the strain on the hose is very light. The exhausted air assists materially in the ventilation of the retort house.

ARROL-FOULIS POWER MACHINERY.

The Arrol-Foulis hydraulic stoking machinery has many points of interest, requiring similar coal breaking, conveying and elevating plant

as the machinery already described. The charging machine obtains its supply from the overhead coal hopper. A small quantity of coal is dropped in front of the pusher plate, which is then propelled into the retort, the coal being delivered by about half-a-dozen propulsions, beginning from the furthest end of the retort, and receding to the mouth. The apparatus for this work consists of a horizontal slide beam, on which are placed two hydraulic rams, one for the forward movement to the pusher plate, and the other for withdrawing it. Alongside the forward or pushing ram is a turning shaft carrying a series of stoppers, which come into operation as the shaft is revolved, bringing the pusher plate to a stand in the successive positions of its stroke. The coal-feeding gear consists of an open drum divided into segmental compartments revolving underneath the coal hopper, and put in motion at regular intervals by means of a hydraulic ram and rack. The action of the drawing machine is so similar to that of the charger that it need not be described. The working pressure usually adopted for this hydraulic machinery is about 400lb. per square inch.

DEPRECIATION OF MACHINERY.

It is sometimes considered that the depreciation of gas-works machinery is necessarily much greater than in other engineering establishments. With proper care and attention this, however, should not be the case. Every wearable part of any of the machines has to be renewed from time to time to keep it in working order, so that, although the wear and tear are greater, the machine itself remains in as fair a condition as machinery elsewhere. As an illustration of this it may be remarked that the author has worked exhaustors of the Jones type, which consisted of two rollers of a figure 8 section, which were fifty years old, for many years with considerable success and equality of vacuum.

LOCOMOTIVES.

The quantity of dust upon a gas-works, especially upon the sidings, and in and about the retort-houses, is every great. The type of locomotive is therefore a consideration. Mr. S. Geoghegan's patent shunting locomotive engine is peculiarly adapted for these conditions for narrow-gauge railways. The working parts of the engine are boxed up on the top of the boiler, and are therefore clear of the liability to be cut by coke dust and grit, as is so often the case when the working parts are under the boiler.

CONCLUSION.

The author considers the foregoing remarks will prove conclusively that rule-of-thumb methods as far as gas-works machinery is concerned are being rapidly superseded by mathematical calculation and design, which to all engineers must be a matter of satisfaction.

A new bridge over the river Derwent, constructed at a cost of over £7000, was opened last week by Mr. Victor Cavendish, M.P., in the unavoidable absence of the Duke of Devonshire.

THE Bristol Town Council has adopted a recommendation of the Docks Committee in favour of going to Parliament for powers to construct a new lock and other works at Portishead Dock, so as to provide accommodation for the largest classes of steamers afloat or building. The estimated outlay is £350,000. An amendment to the effect that the "dockisation" of the River Avon was the best scheme was defeated.

Two propositions are under consideration by the North British Railway for the improvement of their line at Glasgow—the doubling of the tunnel and the reducing of the gradient or the construction of a new branch from the main line round by Sighthill. The latter proposal would mean the carrying on of all the traffic underground, with the necessity of lowering the level of the main station. A start will be made in November with the erection of the Station Hotel on the site of the present hotel and the erection of new offices, &c.

* A paper read before the Society of Engineers, on June 6th, 1898.

Surveying and Sanitary Notes.

THE troubles of turbid water that were so prevalent in the Mid-Sussex district a short time since appear to have passed away. The work of placing valves in the low-lying parts of the mains of the Cuckfield District Council's waterworks, between Balcombe and Cuckfield, disturbed an accumulation of sediment that had been gathering for the past few years, but now that the valves are in working order, the mains clear, and the filter bed at the works so laid down, the water supplied by the Council has been clear and of the best quality.

THE Hackney Vestry moves in a mysterious way. It requires the services of a consulting engineer in connection with its electric lighting scheme. Instead of engaging in a straightforward way the services of a competent man and entrusting the work to him, this vestry is virtually put the job up to auction, and, by a printed circular distributed to a number of eminent engineers, has announced its intention to reserve "the power to carry out the work contained in" the engineer's report either with or without the assistance of the engineer submitting the same." Confronted by such palpable evidence that the vestry is unwilling to place entire confidence in its engineer, even after it has engaged him out of a number of presumable candidates, the eminent engineers approached will probably decline the vestry's invitation to enter the lists as competitors for its patronage. Indeed, in the case, at any rate, such a reply has already been sent.

MR. TROUTBECK and a special jury at Westminster recently heard the case of "Artis v. Her Majesty's Office of Works," a claim for compensation in respect of the freehold interest in premises No. 8, Delahay Street, Westminster. Mr. Cripps, Q.C., M.P., and Mr. A. J. Jam appeared for the claimant; the Attorney-General (Sir Richard Webster, Q.C., M.P.), and Mr. Danckwerts represented the Office of Works.—Mr. Daniel Watney, past president of the Surveyors' Institution, estimated the premises as worth £250 a year on repairing lease, and said that twenty-four years' purchase represented their value, £6000, to which he added ten per cent. for forced sale, £600, making a total of £6600.—Mr. Henry Arthur Hunt and Mr. Robert Griggs also gave evidence for the claimant.—On behalf of the Crown the first witness was Mr. Robert Vigers, president of the Surveyors' Institution, who expressed his opinion that the gross rental of the premises would be about £242, and the net rental £182, which he capitalised at twenty years' purchase, £3640, and, adding ten per cent. for compulsory sale, his total valuation amounted to £4004.—Mr. James Green, Mr. V. E. Horne, and Mr. A. L. Ryde also gave evidence.—The jury awarded the claimant £5000, including the customary allowance of ten per cent. for compulsory sale.

IN the Court of Appeal, before the Master of the Rolls and Lords Justices Chitty and Collins, judgment was given in the case of the Southwark and Vauxhall Water Company v. the Wandsworth District Board of Works. The defendants in this action appealed from the order made by Mr. Justice Kekewich on the 8th of last month on interlocutory motion, whereby he restrained them till the trial or further order from lowering the footways of streets, in their district, under which pipes or mains of the plaintiffs were laid without lowering the pipes or mains to a depth that would protect them. The District Board proposed to lower a footway along one side of West Hill Road, Wimbledon, the object being to level it for the convenience of the public, and the work was carried out on June 16th. This action was brought on June 20th, and Mr. Justice Kekewich granted an interim injunction restraining the defendants from lowering the footway without also lowering

the plaintiff's pipes under it, so as not to expose them to greater danger from frost or otherwise than they were in before. It was agreed on the appeal to treat the motion as the trial of the action.—The order appealed from was discharged, and judgment entered for the defendants with costs.

AT the Middlesex Guildhall, Westminster, recently, Mr. Troutbeck and a special jury heard the case of "Roberts v. The London County Council," a claim for about £33,000 as compensation in respect of the freehold interest in the premises Nos. 268, 270, and 271, Strand, which have been acquired by the London County Council for the purposes of the Strand improvement. The premises Nos. 270 and 271 are in the occupation of Mr. Nutt, at £650 a year, on lease for twenty-one years from 1888; while No. 268 is at present vacant, the front being let as an advertising station at £130 a year. It appeared that Mr. Nutt had to expend about £1000 a year on the premises as one of the conditions of the lease, and it was submitted on behalf of the claimant that the present rental value of the premises 270-271, Strand, is £900 a year. Sir J. Whittaker Ellis valued the property Nos. 270 and 271 for the term of the lease at £6500, and in reversion (deferred twelve years on the 3 per cent. table) at £15,700; and No. 268 at £310 a year (on the 5 per cent. table), £7750; a total of £29,950, to which he added 10 per cent. for compulsory sale, making £32,945, to which one year's rent of No. 268 had to be added as a solatium for the interference with the letting of the property subsequent to the date of the notice to treat.—On behalf of the London County Council the rental in the lease of Nos. 270-271 was stated to be full, and the reversionary rental as not more than £700, while the rental of No. 268 was estimated at £200. From this there was a deduction for repairs, and the total valuations averaged £21,600.—The jury awarded the claimant the sum of £25,850, plus one year's rent of No. 268, making a total of £26,100.

AT the City of London Court, before Mr. Commissioner Kerr, the case of Ockerby v. Legg was heard. Mr. Horace Ockerby, 114, Queen Victoria Street, sought to recover the sum of £15 18s. 8d., rent due from the defendant, Mr. I. J. Legg, 63, Station Road, Camberwell.—The defendant said he did not dispute that the rent was owing, but he raised a counterclaim for money which he had had to expend in doing repairs to the drains of the house. The drains, he said, at the adjoining premises were defective. The plaintiff was the landlord of both houses. The drains next door were a long time being repaired, and when they were finished it was found that one of the pipes running under a wall dividing the premises was defective. The sanitary inspector called, and inquired who was the owner, and he told him. Then the sanitary inspector served notice on the landlord requiring him to do the repairs. The plaintiff sent him a note saying that he was responsible for the work, but he did not accept that position. One foolish thing he did was to tell his own builder to put one of the pipes right, considering the time the neighbours were inconvenienced. When the drains were opened up it was discovered that they were laid beneath the wall of the house, and that was condemned by the sanitary inspector. The relaying of the drains came to £15 18s. 8d., and that sum he now asked the landlord to pay.—The learned Commissioner said the question was, was the landlord bound to make good the cost?—The plaintiff's solicitor said the lease would put the defendant out of court. The repairs were done to the defendant's own drains and by his own builder. There was also a covenant to repair the drains on the part of the tenant.—The defendant said his view was that the work did not consist of repairs.—His Honour said that there must be judgment for the plaintiff on the claim, but the counterclaim would be excluded. The defendant could then bring an action for damages on the ground raised, if so advised.

Builders' Notes.

PREPARATIONS are now being made to demolish the almshouses in West Derby Road, Liverpool. The land, when cleared, is to form a site for a spacious People's Hall. It is interesting to note in this connection that West Derby Road is a very old thoroughfare, having been in existence, under the name of Rakes Lane, so far back as 1768.

THE work of reconstructing Highgate Archway, which is estimated to cost £25,000, is progressing. When completed, the new bridge will have a width of 40ft. between the parapets, 24ft. going to the roadway, and the other 16ft. divided between two footways. This will be a great improvement on the old viaduct, and there will be a clear way beneath it, the bridge having a span of 120ft. The old supports of the viaduct were a great obstruction to traffic.

IT is to be a steel and cast-iron bridge, with concrete, brick, and Portland stone abutments, and so far as possible the old structure is being built into the new. The parapets are to be composed of cast-iron standards, with ornamental iron grilles, surmounted by revolving chevaux-de-frise, so that in future those who are tired of the world either in Hornsey or Islington will find it impracticable to get out of it by climbing over either parapet. The viaduct now giving way to a more modern and commodious piece of engineering was authorised by Act of Parliament in 1810. In order to carry out this and to run a tunnel through Highgate Hill, a company was formed with about £100,000 capital. The tunnel, however, fell in, and the promoters of the scheme gave it up in despair, and resolved to make an open cutting.

AS a result of negotiations, the dispute in the plastering trades at Bolton is at an end. On the 18th June the men struck work for an advance from 9d. to 10d. per hour, and a reduction of working hours from 52 to 49½. The question was then referred to the Lancashire and Cheshire Building Trades Federation. Conferences have been held, and the result of the last conference is that amended rules have been signed, and the men have now returned to work. A concession is made in the hours in favour of the men, who are also granted the advance of 1d. per hour, making the rate 10d. The men on the other hand concede one apprentice to each four men as against a maximum of two, whatever the number of men employed. The rules stand until the first Saturday in July next year.

IT is proposed to construct a new road from Colston Avenue to Stokes Croft, Bristol. The object is to give a direct, wide, and easy thoroughfare from the city to Stokes Croft, relieving the present narrow and circuitous route of a good deal of the through traffic, including the tramways. The new road would commence with a junction with Rupert Street near Christmas Street, passing in front of Lewin's Mead chapel, and pursuing a direct course between the Infirmary and St. James's Church, and north of Messrs. Derham's factory, to the bottom of Stokes Croft. The length would be 633yds., a saving of 100yds. in distance, while the width would be 50ft., and the gradient would be about 1 in 60 throughout, against 1 in 15 in the St. James's churchyard. The scheme would undoubtedly provide a much better entrance to the city from the northern district, and provide valuable sites for shops, warehouses, dwellings, &c.; and it is claimed that while a clearance would be effected of a considerable number of small houses in closely packed districts, no important building would be touched.

A NEW bridge over the Harlem at New York, which has cost over £600,000, was formally opened last month.

THE Salford Corporation has applied to the Local Government Board for power to borrow £33,000 for purposes of electric lighting and £2200 for sanitary works.

PARIS ABATTOIRS.*

By R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page lii., Vol. vii.)

CONTINUING with the buildings placed between the markets and canal, F¹ (Fig. 1) is used as a stable, coach-house, and pound for animals unclaimed by the owners at the end of the market hours. The animals are seldom kept here for any length of time, as a fine is imposed on the owner and a charge made for lodging and food.

Three large buildings running parallel with the canal are grouped round central courts, with two drinking troughs in each. G¹ (Fig. 1) is for stabling calves, H¹ and J¹ for beasts, I¹ for pigs, and K¹ for sheep. The buildings are two stories in height, the upper one being used as forage and litter stores.

Another large "Bouverie" (stable for beasts) is placed at the end of this block (L¹ Fig. 1), with an open court and drinking troughs.

The open yard M¹ is for manure.

SECTION OF DRINKING TROUGH
FIG. 17

A long range of low buildings is placed adjoining the boundary wall of the Canal du Depotoir, and comprise office and weighing machine (O¹) and at N¹ stables, coach-houses, stores, w.c.'s, and private "Bergeries." These latter are each about 21ft. by 18ft.

The foregoing complete the buildings on the southern side of the canal, and are practically all devoted to the sale and part stabling of the live animals.

The Canal de l'Ourocq, with towing paths on either side, is spanned by two bridges (P¹ Fig. 1) with stairs for foot passengers at Q¹,

* This series deals with the construction of the Cattle Markets and Abattoirs of La Villette and La Rive Gauche, Paris.

DIVISIONS OF BERGERIES
FIG. 18

and eight sloping roads (R¹) for animals and carts passing from the markets to the slaughter-houses.

The four small buildings, S¹, are offices and stores.

The "Grand Sanatorium" at T¹ (Fig. 1) consists of an immense wooden structure in which are stabled the sheep arriving from Germany.

At the entrance is a small enclosure (U¹) for the Veterinary Inspector, who examines each animal as it passes through the barriers. They are kept in the sanatorium for some days previous to being killed, and are inspected twice a week during that time.

An open court divides this building from V¹, in which are stables for foreign cattle, and also a Lazaret.

The "Usine Frigorifique" at W¹ is a comparatively new and well designed building in stone with tiled roofs. It is here that the meat is frozen for consumption by the Army, and is the only Government building on the site. Permission to enter can only be obtained from the Minister of War, and this I was unable to get during my visits. The freezing process, is, I believe, a secret one, and the entrance is guarded by a sentry who was even doubtful about allowing me to take sufficient measurements to indicate the position of the building on plan.

The "Usine Electrique," for supplying electric light over the whole site, is at X¹ (Fig. 1). This is also a new building, and is exceedingly good in design.

The "Triperie" is at Y¹ (Fig. 1), and it is in this building that intestines are finally cleansed and rendered fit for food. There are also a number of boilers and machines for preparing calves' feet, &c.

The tripe and intestines generally are first washed in the large glass-covered court at Z¹, where there are two long stone troughs for this purpose.

The small buildings A A, B B, C C (Fig. 1), are used for various purposes in connection with the preparation of tripe, sheeps' heads, calves' feet, &c. D D is a stable and coach-house.

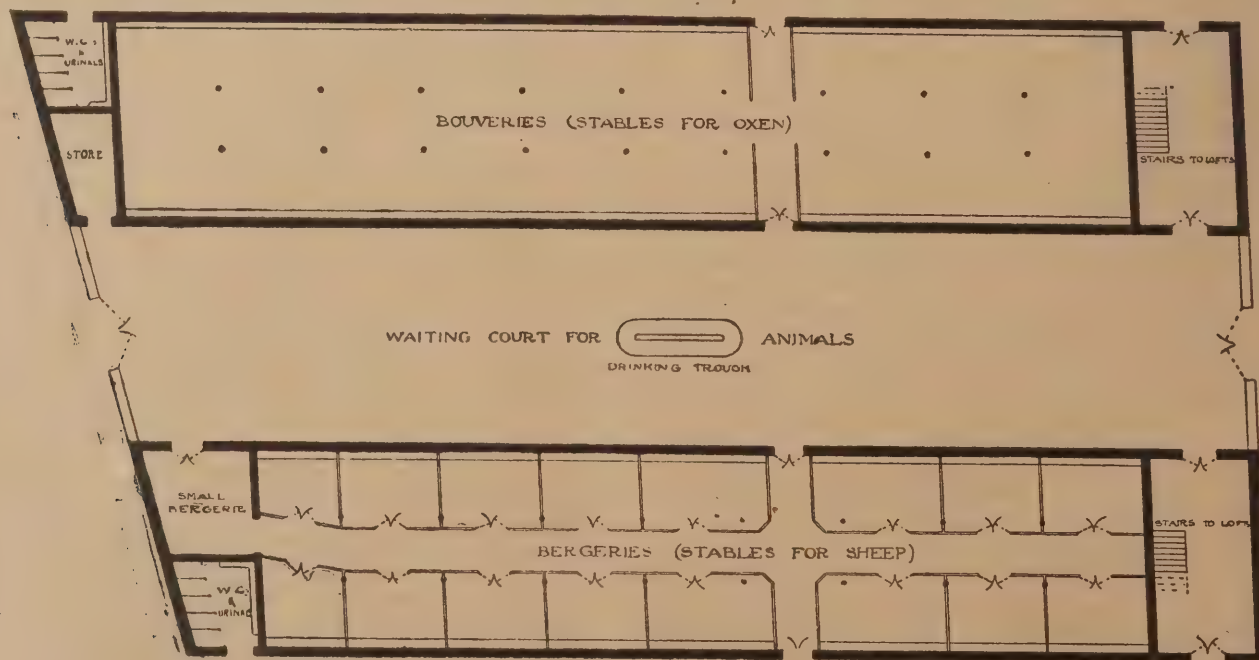

We now come to the large group of buildings for stabling and killing the animals, and for dressing the carcasses.

These buildings are divided by a wide central roadway (Avenue du Centre) and by two roads of less width (Avenues du Nord and du Sud), whilst the blocks of stables are separated from the slaughter-houses by transverse roads.

Fig. 15 (F F on block plan) shows the plan in detail of one range of cattle stables, and, whilst (as will be seen on plan) they all vary in size, it may be taken as typical of the general arrangements.

Between the "Bouveries" and "Bergeries" is a large courtyard 30ft. wide, and covered by an iron and glass roof (Fig. 16), and has a double drinking trough in the centre. It is in this court that the animals are kept just previously to being killed, and they are taken direct from here to the slaughter-house. At the extreme ends of the court are folding wooden gates. On the southern side are the "Bouveries" (stable for beasts), 33ft. wide, and on the northern side are the "Bergeries" (stable for sheep), of equal width.

Feeding troughs are placed along the outside walls as shown. Cast-iron columns support girders carrying the fireproof floor between the stables and lofts over. These latter are

PLAN
FIG. 15

approached by staircases at the ends of each block. The stables are paved in cement, and the courtyard in granite blocks.

In the "Bouveries" iron rings are fixed in the walls, at a distance of 3ft. apart, to which the animals are tethered. The partitions for dividing the pens in the "Bergeries" are of wood, matchboarded below and with square balusters above, as shown on Fig. 18.

The stables both for beasts and sheep are lighted and ventilated by windows, the eills of which are about 9ft. from the ground (see Fig. 16). The elevations generally are similar to those of the "Echaudoirs" described and illustrated later on, with the exception that the lofts are provided with dormers for receiving forage and litter, and the positions of doors vary as shown on the plans.

(To be continued.)

A RELIC, which appears to possess authentic claims to great historical interest, has just been acquired by the Musée Carnavalet in Paris. It consists of a portrait, in neutral tint on porcelain, of Robespierre, and there is every reason to believe that the incorruptible hero of the Revolution considered it his most faithful presentment. At any rate, according to Dr. Suberbielle, to whom he gave the picture, it used to adorn the modest bedchamber occu-

FIG. 16. INTERIOR OF WAITING COURT.

pied by Robespierre in the house of the Duplays, out of the Rue St. Honoré. Before his death Dr. Suberbielle handed over the treasured plaque to the famous artist, David d'Angers, who recorded the fact in a duly signed inscription on the back of the frame. M. Robert David d'Angers, the representative of the sculptor's family, has presented this heirloom to M. Georges Cain, the director of the museum, in order that it may be preserved to posterity.

Trade and Craft.

MESSRS. YOUNG AND MARTEN.

The employees of Messrs. Young and Marten, of Caledonian Works, Stratford, E., had their annual outing a few days ago. For the great majority, Margate was the rendezvous, and the excursionists had the hearty good wishes of the principals, who were represented by Messrs. Frank and Ernest Marten; and the personal support and co-operation of the very popular general manager, Mr. E. Montague Edwards. The annual outing is but one of many social functions held in connection with the works during the year, and the spirit of good fellowship fostered by these social re-unions must inevitably conduce to the excellent results of the firm's operations. At Margate, the staff had dinner at the Terrace Hotel. Mr. Edwards (the chairman) proposed "Prosperity to the Firm." In a sense, he said, every individual present formed part of the firm, as without the continued harmonious working of each, its advancement could not be assured, and it needed their entire co-operation. He remarked: It has been stated the firm is becoming too large for one or two individuals to direct, but personally I am convinced that with the administrative powers of the heads

head of all matters, Mr. H. Holdich Marten, who is very ably represented at your boards by Mr. Frank and Mr. Ernest Marten.—"The health of Mr. H. H. Marten and family and of the firm" was very cordially honoured. Mr. Frank Marten replied.—Mr. R. Letby proposed the Chairman's health, remarking how very highly Mr. Edwards was respected by every man assembled, from the highest to the lowest, and mentioned how, if any were in a difficulty, he was the first to enter into it and assist them out. He not only carried his sympathies into business life, but into their little pleasures and social matters.—The toast was drunk amid loud cheering.—In responding, Mr. Edwards said: I thank you sincerely for the kind way you have acknowledged and received the toast of my health. I came here specially to be at your banquet. I fear this may be the last occasion I may be privileged to preside in the sense I am now doing. The administration of your funds must of necessity be slightly altered. I am glad you have caught the spirit of these remarks, and feel this will assist the matter, and shall have the opportunity of putting this before you in detail and in a more lucid manner for consideration at a later date. You will not lose your outing; that must be a thing in perpetuity. As years come and years go we shall expect to meet you. I trust that I may be spared in health and strength to be with you to preside over your annual gathering, year by year, so that you will understand I am in no sense desirous of dispensing with these very enjoyable occasions. I thank you sincerely one and all for the kind manner in which you have received this.—Mr. Swainson proposed the health of "The Visitors."—Mr. Ernest Rayner replied on behalf of the visitors.—A few remarks from Mr. H. J. Dyer, in which the health of Mr. David Owens (honorary secretary) and Mr. A. Milne (assistant secretary) was proposed, brought the proceedings to a termination.

PARQUET FLOORING.

The handsome parquet flooring in the upper hall of the Walker Art Gallery, Liverpool, which, as we announced in a recent issue, has just undergone renovation after twenty-one years' service, is Arrowsmith's well-known solid inch thick material. The floor was laid by Messrs. A. J. Arrowsmith and Co., of 80, New Bond Street, W., in March, 1877, and now that the various woods—oak, sycamore, walnut, and ebony—have been revived and polished, the effect, we are informed, equals new work.

A PLAN for converting the unsightly mud foreshore at Southend into a sand parade has been submitted for approval. The proposal is to fill in the space—which is at present useless for sea or land purposes—to above high-water mark, so as to be available at all times of the tide. It is stated there are no engineering difficulties to overcome, and little more than unskilled labour would be necessary, so that the cost would be small for making one of the finest seaside promenades in the kingdom.

Property and Land Sales.

LIST OF AUCTION SALES.

MESSRS. DOUGLAS YOUNG and CO.'S AUCTION ARRANGEMENTS for 1898 include **PROPERTY SALES** at the **MART, E.C.**, on the following dates throughout the ensuing year:—
 Wednesday, Sept. 7. Wednesday, Nov. 16.
 Wednesday, Sept. 21. Wednesday, Nov. 30.
 Wednesday, Oct. 5. Wednesday, Dec. 7.
 Wednesday Oct. 19. Wednesday, Dec. 14.
 And important **LAND SALES** on the following dates:—

1. **BEMBRIDGE**, Isle of Wight.—Tuesday, Sept. 20.
 2. **ILFORD** (on the Park Estate).—Thursday, Sept. 22.
 3. **HAROLD WOOD**, Essex.—Wednesday, Sept. 21.
 4. **BRIGHTON** (Queen's Park Estate).—Wednesday, Sept. 21.
 5. **ILFORD** (Lorford Hall Estate).—Wednesday, Sept. 21.
 6. **BEXHILL-ON-SEA**.—Early in October.
 7. **HIGHGATE** (Priory Estate).—Early in October.
- Further particulars may be obtained of the **AUCTIONEERS**, 51, Coleman-street, E.C.

ALE, at the **Mart, E.C.**, on Wednesday, September 7th.

LEWISHAM, WANDSWORTH, and ILFORD.
EWISHAM.—By order of the Mortgagees.—Leasehold Ground Rents, amounting to £85 10s. per annum, secured upon and arising out of Five Substantial Residences, a range of Stabling, and Four Parcels of Building Land, situate in Slaitwaite-road, Lingards-road, and Morley-road. Solicitors, Messrs. Thorne and Welsford, Solicitors, 17, Gracechurch-street, E.C.; John Annan and Edward Dexter, Joint Managers United Realisation Company, 32, Old Jewry, E.C.

MESSRS. DOUGLAS YOUNG and CO. will **SELL** the above by **AUCTION**, at the **MART, E.C.**, on **WEDNESDAY, SEPTEMBER 7th**, at **10** precisely.
 Particulars and conditions of sale may be obtained at the **MART, E.C.**; of the respective **SOLICITORS**; or of the **AUCTIONEERS**, 51, Coleman-street, E.C., 213, Clapton-road, S.W., and Ilford, E.

IMPORTANT SALE on **TUESDAY, Sept. 20th, 1898**, of the House and Land Investment Trust (Limited). In Liquidation.—One of the Balfour Group of Companies.

BEMBRIDGE, ISLE OF WIGHT.
 Wealthy Capitalists, Syndicates, Land Speculators, and others.

Celebrated for its equable climate and unrivalled land and marine views, situated between Ryde and Sandown, on the coast line of the world-renowned yachting waters of the Solent, and possessing a harbour with good quay accommodations and sheltered anchorage. The Isle of Wight Railway Company has a station here, and has recently acquired large areas of land for extension of the line.
 The important Freehold Properties known respectively as the Bembridge Lodge Estate and Brading Harbour Estate, comprising 38 acres of building land ripe for development, twenty-six choice building sites, and two detached residences known as Garcock and Glenhurst, in Bembridge-road; 520 acres Agricultural and Pastoral Land, including the Home Farm, with farmhouse, homestead, and two cottages; the Ladies' Golf Links, having an area of nearly 42 acres, and several parcels of allotment land and pasture; also as a going concern, the Bembridge Brickfield, with Scotch kiln and brickmaking plant.

MESSRS. DOUGLAS YOUNG and CO. will **SELL** the above **ESTATE**, in lots, by **AUCTION**, in a **Marquee** on the estate, on **TUESDAY, SEPTEMBER 20th**, at **TWO** precisely (after the noon).

Full particulars, plans, and conditions of sale may be obtained of Messrs. **BAXTER, SPREAR, and JOHNSTON**, Solicitors, 32, Old Jewry, E.C.; of Messrs. **WELLS, ADDISON, BROWN, and JONES**, Solicitors, 2, Old-court, Walbrook; of **JOHN ANNAN and EDWARD DEXTER**, Joint Managers, United Realisation Company, Old Jewry, E.C.; at the principal hotels in the neighbourhood; or of the **AUCTIONEERS**, 51, Coleman-street, E.C., and at Clapham, S.W., and Ilford, E.

Westgate-on-Sea, proverbially one of the healthiest towns on the English coast, 1½ hours' journey from London.—Valuable sites in choice positions, suitable for the erection of marine residences.

MESSRS. ROGERS, CHAPMAN, and THOMAS (in conjunction with Mr. E. Temple) will **SELL** by **AUCTION**, at the Station Hotel, Westgate-on-Sea, on **WEDNESDAY, AUGUST 31st, 1898**, at **2 P.M.** precisely, in lots, several **PLOTS** of **LAND**, commanding sea views, and others suitable for the erection of detached and semi-detached residences of all character; also a few shop plots. Favourable opportunities are offered to gentlemen desirous of doing to their own tastes in a select seaside resort, an excellent bathing, pure water, good train service, sheltered gardens, and public promenades. Arrangements can be made for payment by instalments.—Plans, particulars, and conditions of sale of Messrs. **FARRER & CO.**, Solicitors, 66, Lincoln's Inn-fields, W.C.; of **E. Temple**, Estate Office, Westgate-on-Sea; and of **AUCTIONEERS**, 50, Belgrave-road, South Belgravia, W.8; Gloucester-road, South Kensington.

Sale, September 6th.
LEWES, Sussex.—To Builders, Land Companies, Speculators, and others.—A very eligible **FREEHOLD BUILDING ESTATE**, ripe for immediate development, comprising the remaining portion of the Wolands Park Estate, occupying a choice position, immediately adjoining the notably healthy country town of Lewes, comprising an area of about 30 acres, divided into lots varying from quarter to 14 acres, affording charming sites for medium-sized residences, similar to those already erected upon the estate, whilst the western portion is more particularly adapted for the erection of cottages, both of which are in great demand. Also Freehold Rent Charges, amounting to £36 8s. 6d. per annum, well secured upon properties already erected upon the estate, Freehold Ground Rent of £1, and tithe apportioned at £4 16s. 2d. per annum.

MESSRS. BEAN, BURNETT, and ELDRIDGE will **SELL** the above by **AUCTION**, by direction of the Trustees of William E. Baxter, Esq., deceased, at the **WHITE HART HOTEL, LEWES**, on **TUESDAY, SEPTEMBER 6th, 1898**, in 23 Lots.
 Particulars and plans may be obtained at the place of sale; of **REGINALD T. BAXTER, Esq., Solicitor**, No. 9, Albion-street, Lewes; or of the **AUCTIONEERS**, 14, Nicholas-lane, London, E.C.

By order of the Mortgagees.
BEDFORDSHIRE.—The Cockayne Hatley Estate.—An important Freehold Manorial Residential and Sporting Estate, situate five miles from Sandy on the G.N.R., whence London is reached in about an hour, two miles from Potton and Gamlingay Stations on the L. and N.W. Ry., also six miles from Biggleswade and fourteen from Cambridge.

It comprises an exceedingly picturesque old-fashioned mansion-house, approached through a well-timbered park by a long carriage-drive, with lodge entrance, and contains all the accommodation required by a family of position. There are excellent stables, gardens, grounds, and kitchen gardens.
 The estate extends to an area 1527 acres, and includes a large portion of the village of Cockayne Hatley, Wrestlingworth, farmhouses, cottages, buildings, &c. It lies in a ring fence, and forms a most compact sporting estate, the woods of 120 acres being well situated for the preservation of game, and the farm lands are excellent pasture ground, the whole producing about £1200 per annum. Also the Manor of Cockayne Hatley and an undivided third of the Manor of Wrestlingworth, and the Advowson of the Rectory of Cockayne Hatley, subject to the life of the present incumbent.

MESSRS. HUMBERT and FLINT have received instructions to **SELL** the above by **AUCTION**, at the **MART, Tokenhouse-yard, E.C.**, during the month of September.

Particulars and conditions of sale (when ready) may be obtained from Messrs. **R. S. TAYLOR, SON, and HUMBERT**, Solicitors, 4, Field-court, Gray's-inn, W.C.; and from the **AUCTIONEERS**, 11, Serle-street, Lincoln's-inn, W.C., and Watford, Herts.

BUILDING LAND

TO CONTRACTORS, BUILDERS, WHARFINGERS, and OTHERS.
BY ORDER OF THE KENSINGTON VESTRY.
NOTICE OF SALE BY TENDER OF FREEHOLD and LEASEHOLD WHARF PROPERTY, Queen's-road, Hammersmith.

The Vestry of the Parish of St. Mary Abbott's, Kensington, in the Administrative County of London, hereby give Notice that they are prepared to accept **TENDERS** for the **PURCHASE**, in separate lots, of their valuable **FREEHOLD and LEASEHOLD RIVERSIDE WHARVES**, in Queen's-road, Hammersmith.

The Leasehold Wharf is held by the Vestry direct from the Freeholder for a term of 99 years, from JUNE 24th, 1864 (leaving about 65 years unexpired), at an annual rental of £120.

Full possession will be given on completion of the purchase.

Forms and conditions of Tender, with plan, can be obtained at the Offices of the Vestry Clerk, or of the Surveyor, Town Hall, Kensington High-street.

Tenders must be delivered in a sealed cover at the Vestry Clerk's Office, on or before **FOUR P.M.** on **SEPTEMBER 9th, 1898**, endorsed "Wharf Tender," and signed by the party tendering.

Town Hall, **WM. CHAMBERS LEETE**, Vestry Clerk.
 Kensington High-street, W.
 July 18th, 1898.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly **PREPARES CANDIDATES** for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. **W. CHURCH HOWGATE, A.R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

COMMISSION open to Gentlemen already calling upon Architects.—**J. W.**, 12, Red Rock-street, Liverpool.

PARTNERSHIP.—Young **ARCHITECT** good London training, **DESIRES WORKING PARTNERSHIP** in established firm. Is an able designer and draughtsman, with good practical experience.—Address, **ARCHITECT**, care of **J. R. Farrar, Esq., Solicitor**, Halifax.

ARCHITECT'S LEADING ASSISTANT, of best London experience in high-class work, renders confidential assistance to Architects at his own home.—"Sillitoe," BUILDERS' JOURNAL Office.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

COSTING CLERK REQUIRED, accustomed to Builder's or Engineer's office. Must be quick at figures. One with a knowledge of architectural drawing preferred.—Address, stating age, qualifications, and salary, with copies of testimonials, to Box 996, BUILDERS' JOURNAL Office.

BUILDING SURVEYOR WANTED, having a knowledge of land surveying. Permanency.—Address, **SAMUEL ROBERTSON**, Contractor, Bristol.

ARCHITECT'S ASSISTANT WANTED at once. Good general knowledge. Quick and reliable.—Address, **J. Wigg, Architect**, Berridge-street, Leicester.

STAFFORD UNION.
WORKHOUSE DRAINAGE SCHEME.
CLERK OF WORKS WANTED.

The Guardians of the above Union require **AT ONCE** the **SERVICES** of a competent **CLERK OF WORKS** to supervise the carrying out of the above Drainage Scheme.

It is essential that Candidates should have had considerable experience in drainage work.

Salary £4 per week, guaranteed for three months.

Applications, stating age, qualifications, &c., together with copies of three recent testimonials, must reach me not later than **TEN a.m.** on **SATURDAY**, the 20th inst.

WILLIAM MORGAN, Clerk.
 Union Offices, Stafford,
 August 15th, 1898.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., **DESIRES TO ASSIST** others in the **PREPARATION OF DRAWINGS** at his own office.

G. SCOREE, 23, Newman-street, W.

YOUNG MAN WANTS SITUATION; take charge of engine, boiler, planer, and sawbench; town preferred.—"C. J. L.", care of Wallis, Hairdresser, Wallington, Surrey.

YOUNG ARCHITECT, having had ten years' good general experience in a large provincial office, wishes to obtain **PARTNERSHIP** in well-established practice.—**J. A. W.**, 17, Furnival-road, Sheffield.

ARCHITECT'S ASSISTANT DISENGAGED shortly. Good draughtsman; specifications, knowledge of quantities, shorthand. Midlands preferred.—Address, "Nottingham," Office of BUILDERS' JOURNAL.

A PRACTICAL SURVEYOR is open for **ENGAGEMENT** as **SUPERINTENDENT**. New buildings or alterations. Factories a speciality. Good references. Terms, &c., by letter.—**SURVEYOR**, Deptford Constitutional Club, 411, New Cross-road, S.E.

ARCHITECT AND SURVEYOR'S GENERAL ASSISTANT DISENGAGED. Thoroughly competent. Office routine, surveying, levelling, &c. Salary 30s. for London.—**MORGAN**, 45, Torrington-square, W.C.

An Architectural Causerie.

The Architectural Draughtsman. In a well-known handbook of English domestic Architecture there is a series of illustrations of country cottages and inns, drawn with such tedious monotony of treatment as to make one wonder whether the idea of individuality in a building had ever occurred to the artist's mind. We

of houses in a park, or the blank dreariness of East London "mean streets," and the sordid mysticism of the Ghetto. There seems nothing to correspond with this delineative power in the treatment of Architecture in modern black-and-white. Leaving out the one or two really capable artists whose work appears from time to time in architectural journals, the average illustrator either produces a feeble imitation of Mr. Herbert Railton's style, or lapses into a hasty rough-draft of elevations and sites. What is chiefly lacking is an intelligent interest in the buildings themselves; that knowledge "of the fact behind the appearance," on which is based the only impressionism proper to Art. Just as a great portrait painter can make an entirely plain face eloquent upon canvas—just as Millet reveals a living personality in the bowed figure of a peasant, whose features are scarcely seen—so an artist with the true architectural feeling can make the most commonplace building show distinctive character beneath his touch, breathing the very

—a feeling for the individual qualities of structures and substances, over and above the merely literal transcription of their form. The masters of modern black and white have learned in other fields of study to express character in a single line; to put humour, pathos, and satire into the roughest thumb-nail sketch of the society beauty or the man in the street. Might not a little of this skill be turned in the direction of Architecture? Who will say that there is no humour in the shops and houses of an English country town, and still more in its monuments and churches—in Mediæval and Renaissance carvings, made when imagination peopled the air with gnomes and fairies, devils and saints, who frown or grin at us out of the old grotesque gargoyles and pinnacles? And apart from these fantastic relics, the very body of a house may almost laugh or weep. Who does not know ghostly houses—furnish and populate them to the utmost, and they will look empty still; pale skeletons, which no decking or garnishing

AROUND WARWICK WITH THE ARCHITECTURAL ASSOCIATION. KNOWLE CHURCH.

know with what infinite variety of touch a good writer will draw in words his picture of a village or a dwelling in a town, revealing in a few keen phrases the character of trim suburban terraces, the hospitable seclusion

spirit of the country and the soil, and even of the people that built and inhabit it. And how rich our own land is in material for treatment of this kind!—we will not call it idealisation, but rather a finer kind of realism

will ever make alive? Each highway has its empty houses, too; bare stranded hulks that haunt the memory; "haunted" themselves probably by nothing worse than bad drainage and an unlucky site; but "done

up" and repainted vainly so often that it seems as if the shell had shrivelled under the brush. Again, the dominant features of a building vary immensely at different seasons and hours. There is at Hampstead a "phantom window," which, when lit up at night from within, appears in certain aspects to have "no visible means of support"; to gleam, as it were, out of the sky, with no house behind or beneath it. Dormer windows set at great distance from the lower stories will often wear this remote and isolated look, especially in hilly landscapes on a dark evening, when perspective plays strange tricks with the sight. These rare and fascinating aspects of Architecture are left—and perhaps rightly—to the painter of pictures; but the office-trained draughtsman, wholly ignorant of Art, does not scruple to dabble in pictorial trimmings to his professional work. A few stock clouds, three birds, and a milk-cart, are the usual accessories to somebody's new house at Shingleton, or an elm and a choir-boy to somebody else's proposed church at Holbury. These regulation properties are seldom exceeded: he would be a bold man who should seek to emphasise the beauties of "The Nest," or "The Haven," by a rainbow and a thunder shower. It is not our contention that the architect should be discouraged from making his plans and elevations into a picture, if he so pleases: on the contrary, no true account of any building, old or new, can be given in a bare and literal transcript of its form. But there should be a clear distinction made between a professional statement in line, drawn up for the use of those concerned with the practical and technical side of the case, and a picture intended to give a general representation of the building to the public eye. The draughtsman who attempts this should know the habits and moods both of old and new buildings as well as the society satirist knows expression and costume. He should be able to recognise the signs of age in Architecture, such as the droop of an ancient roof, like the slope of an old man's shoulders. He must see more than the prosaic noonday aspect of his subject, but he must be consistent in the setting which he chooses to carry out. He should no more "pose" his building in an affected and antiquated fashion than he would have his own portrait taken beside the cardboard balcony of twenty years ago, with the conventional album and potted fern. The surrounding landscape must be accurate in its features. The draughtsman who has nothing but new buildings to deal with is apt to lack the sense of proportion and balance in his work. Historic feeling is unattainable by him who knows only one generation of builders, and has not at some time steeped himself in the aspirations of the past. Unfortunately, however, not only the architectural draughtsman in the Profession itself, but even the average black-and-white illustrator, is densely ignorant of architectural styles, and might at any time lapse into Byzantine ornament in a sketch of Durham Cathedral, or try to transfer the exquisite Flemish grace of Ely or Boston to the rugged fanes of the north and west. It is surely not too much to ask from him some elementary knowledge of Gothic principles, and of what combinations actually occur on English ground. To go still further, and to demand that he shall intelligently know towns as Thackeray knew them, would doubtless be to put the draughtsman into closer touch with literature and history than he is usually found. The suggestion throws us back upon the need of broader and more versatile culture in the artist himself; breaking down the artificial and mischievous barriers that have arisen between different branches of Art, and bringing the professional and the æsthetic sides of Architecture into right relations with each other.

E. W.

THE PRESERVATION OF OLD LONDON.

FROM time to time London learns through the Press of the impending destruction of some memorial of its past. Sometimes it is a spot sung of poets, such as the Tabard in Southwark; sometimes a relic of a bygone phase of life—an Inn of Chancery, an old pleasure garden; sometimes a specimen of the work of a great architect. Occasionally public feeling is aroused, strenuous efforts are made, and the threatened blow is averted or delayed. The contest over the Trinity Almshouses at Mile End, and its successful issue, are fresh in the public mind. Staple Inn, put up for sale as a building estate, was a few years since rescued by the generous intervention of the Prudential Assurance Company. Parliament refused

TO RUIN THE CHARTERHOUSE.

But too often the news comes too late to admit of intervention, and in some cases intervention is impossible. Lady Dacre's Hospital at Westminster, the quiet beauty of which is said to have inspired Fred Walker's "Heaven of Rest," and the old Palace of Bromley-by-Bow, one of the few remaining Elizabethan houses of London, have both disappeared during the present decade. These fragments of antiquity were of a more or less public character; buildings in private hands are in still greater danger. The "Old Bell," in Holborn, with its pit and gallery, has been demolished within the last twelve months. Sir Joshua Reynolds' house in Leicester Fields is threatened. And Hampstead, the suburb which, rich in associations, in natural beauty, and in

QUAINT VILLAGE-LIKE NOOKS AND CORNERS, most resolutely resists absorption in the metropolis, sees one of its characteristic features, Church Row, invaded by the modern pile of flats. Some of these changes cannot be prevented. But a little consideration and careful planning may sometimes save the charm of a building without interfering with its money-making capacities. Everything has its value in a complex community like London, and there is a certain market price for quaintness and antiquity, perhaps for architectural beauty. Thus, even where purely private interests are concerned, something may now and again be done to avert needless destruction; where public bodies can be appealed to, there is better hope. But at present there is a serious preliminary difficulty in the absence of definite and easily accessible

INFORMATION RESPECTING OLD LONDON,

and of any machinery for insuring timely warning of a threatened danger. It is satisfactory to learn, says the Times, that an attempt has lately been made to meet this want. As might have been expected, the society which the late Mr. William Morris organised for the protection of ancient buildings is the home of the movement. Some three years ago a committee in connection with this society was formed for the purpose of compiling a register of all objects of an historic or æsthetic nature within an area bounded on the south by the Thames, and extending northwards and eastwards twenty miles from Aldgate. Buildings are, of course, the primary care of the committee, but it extends its survey to any interesting relic—an open space, a beautiful tree, "any interesting piece of handicraft, if it be but a sign-board or wrought-iron gate." The methods of the committee are exact and business-like. The position of the building or other object, its owners and occupiers and condition of repair, a careful description of its character and date, notes as to its history, and a reference to any books which treat of it, are all entered in a schedule. These particulars are illustrated by sketches, photographs, and measured drawings, which are arranged in albums according to parishes. The fulness with which the committee performs its task may be estimated from the fact that, while some two hundred places have been the subject of examination and report, no fewer than a thousand drawings, photographs, and

sketches have been made. It is obvious that, if the work is completed on the same scale, it will eventually, as the committee states, form "a unique collection of what Greater London at the close of the present century still retained of historic interest or beauty." The fact that the late Lord Leighton was president of the committee, and that such names as Mr. Walter Crane, Mr. Philip Norman, Mr. Hamo Thornycroft, Mr. Humphry Ward, and Sir Walter Besant appear on the list of its supporters is a guarantee of the thoroughness of the work. Its chairman and organiser is Mr. C. R. Ashbee. It is the design of the committee—which possesses a long name but prefers to be called the "watch committee"—to publish not only the register, in suitable parts, but separate

MONOGRAPHS ON PLACES OF ESPECIAL INTEREST.

One of these has already seen the light. Its subject was the Trinity Hospital, Mile End. And here the practical as well as the literary value of the committee's work is well seen. For it was owing to information obtained by the Watch Committee in the course of its work that attention was drawn to the proposal of the Elder Brethren of the Trinity House to sell the hospital and remove its inmates—a proposal eventually negated by the Charity Commissioners upon the opposition of many societies. Again, the State Room in the old Palace of Bromley-by-Bow (the subject of another monograph) was, at the instance of the Committee, moved to South Kensington; and an attempt to pull down Bow Church for the widening of the thoroughfare was foiled through an appeal to the London County Council. But the most remarkable outcome of the committee's work has still to be mentioned. In December last it induced the London County Council to call together representatives of the several societies interested in Old London. At a committee of the Council it was decided to be desirable that a "register or list be made of buildings of historic or architectural interest in London," and that a permanent committee, to consist of members of the Council and of outside bodies, be constituted for the purpose. The work of the Watch Committee was, moreover, adopted as the foundation for the official register, portions of which will in due course be published. Further, by an Act of this Session, the Council has obtained power

TO PRESERVE OLD LONDON,

either by the purchase (by agreement) of buildings and places of historical or architectural interest, or by entering into arrangements for the maintenance and management of such buildings and places. As the Council is itself constantly engaged in carrying out, or authorising, schemes which involve serious changes, it is something to know that the importance of preserving, so far as possible, what is interesting or beautiful will not be lost sight of in such operations. But, apart from this, it is a notable step in advance to have secured the recognition by a powerful executive body of considerations which have often been condemned as merely sentimental. Throughout most of the countries of Europe there are authoritative registers of antiquities, and commissions charged with the duty of fostering respect for, and interest in, these legacies of time. The only similar attempt in this country is embodied in Sir John Lubbock's Act for the Protection of Ancient Monuments, but its scope is singularly narrow, embracing only monuments of the megalithic order. It is to be hoped that the many societies interested in such questions (with the powerful aid, now secured, of the London County Council) may be instrumental in extending the protection of organised public sentiment to a much larger class of interesting remains; and there cannot be a more fitting centre in which to begin such work than the ancient and historic capital of the Empire.

A NEW Wesleyan chapel is about to be built at Hindle, near Wigan, from plans by Messrs. William Waddington and Son, of St. Ann's Square, Manchester.

On Tour with the A.A.

IN AND AROUND STRATFORD-ON-AVON.

(By a Special Correspondent.)

(Continued from page 20.)

STRATFORD-ON-AVON, with its many places of historic interest, is the next town to be visited, space allowing mention of the church alone.

This building stands on the banks of the Avon, and the whole forms a picture of much beauty. It is dedicated to the Holy Trinity, and consists of a nave, with aisles, transepts, chancel, central tower, and north porch. The walls of the tower, the north aisle, transepts, and nave, are of the commencement of the thirteenth century, but owing to the many alterations made, these have lost many of their original characteristics. The south aisle was erected about 1332 by John de Stratford, who, at this time, made many alterations here, and Thomas Balshall, warden of the college, took down the old chancel and raised the present choir between 1465 and 1490. The porch is later, having been added at the latter part of the fifteenth century, and the present stone spire takes the place of a timber one taken down in 1764 owing to decay. The tower has crocketed pinnacles at the angles, and is lighted on each side by a circular window filled with tracery. The nave has a good panelled oak roof, and six decorated arches divide it from the aisles. The clerestory, pulled down at the end of the fifteenth century, was also decorated. This has been replaced by the present one, consisting of twelve large windows, each of three lights.

The north aisle is lighted by four three-light windows. This aisle was originally narrower, but was enlarged at the time the south aisle was built. At the east end was originally a chapel dedicated to the Holy

Virgin. This site is now occupied by monuments. The south aisle is also lighted by four three-light windows, each differing as to its details. In 1332 the aisle was rebuilt by John de Stratford. A chapel at the east end, dedicated to St. Thomas à Becket, was founded by him, though of this not much remains. At the east end are several monuments, and in the south wall the remains of a triple sedilia are to be seen.

Mention must be made of the north porch, which was added at end of fifteenth century, and this is battlemented and supported by buttresses, having crocketed pinnacles. The upper story contains a room, and is lighted by a three-light perpendicular window between two canopied niches. Over the arched doorway at the west end are three canopied niches, which at one time evidently held the figures of saints.

Solihull was the next town visited. This is a small picturesque town lying between Knowle and Birmingham. As in most villages in this county, good examples of half-timber work are to be found, so Solihull is no exception to this fact, and in the main street two excellent specimens may be seen.

The church is built in red sandstone, and has a nave with aisles, central tower with spire, north and south transepts, and a very good chancel. The spire, which is about 213ft. high, was rebuilt in 1757, the original having been blown down. The tower is a fourteenth-century one. Entrance to the church is gained by a north porch, and a doorway at the west end. There is no clerestory, resulting in the nave arches being lofty. At the east end of the south aisle is a stone reredos divided into fourteen niches, being intended for figures of the Virgin, the patron saint, and twelve apostles. The remains of a wooden reredos and piscina are in the north aisle, which forms St. Anthony's Chapel. On the north side of the church is a chapel of two stories, the top portion being used as a vestry.

The chancel has many features of interest, and is of Decorative period. On the south side, the two-light windows are unique, the

peculiar cusping being especially noticeable. The east window of five lights is also good. A plain sedilia, having three seats at different levels, and a piscina having a crocketed canopy, occupy a portion of the south side, the entrances to which are side by side—one leading to the lower chamber, the other to the vestry. The lower chamber is divided into two bays, and is lighted by four narrow lancet windows. The upper chamber was originally most likely a chantry chapel founded in 1301. It was formerly lighted by six windows, of similar design to those in the chancel, two of these, now blocked up, formerly opened into the chancel.

The pulpit is Jacobean. Here, as in many other cases, some good oak furniture is to be seen.

Hampton-in-Arden.—The church consists of a chancel, battlemented nave and tower, and aisles, and is also built in the red sandstone. Formerly there was a spire, but this in 1603 was struck by lightning. The chancel is twelfth century; nave and aisles, thirteenth; the clerestory having been added in the fifteenth century, when the tower was also built. On the south wall is a trefoiled piscina, and adjoining this is a recess for an altar. There is an interesting stone seat here, which extends along this south wall nearly to the door. This form of seating was used before pews were introduced. On the south side of the chancel, a piscina and stone sedilia will be noticed on the south side of the chancel. In this wall is a heart shrine—i.e., a shrine where the heart of a deceased person has been interred, this having been a common practice. It consists of an Early English arch, supported by dwarf shafts enclosing a trefoiled arch, inside of which is an angel bearing a shield, with the arms of the Erdington family.

Close to the church is an old half-timbered house, with porch, round which traces of a moat may be seen. This was formerly the manor house of Ardens.

Among other places Bedford Church was visited. It consists of a chancel, nave, and aisles, and a very unique tower. This is

MR. WALTER CRANE.

battlemented. The base slopes to a considerable height, and at one corner is a projecting stair turret, lighted by small windows. This finishes with a battlemented parapet, which rises above the tower. The chancel is Early English, and contains a monument to Dorothy Skipworth, 1655. Close to the altar is a piscina, which has been restored extensively. A large church iron-bound chest is one of the most interesting objects here.

Besides the places mentioned above, Baddesley Clinton, Ram Hall (near Hampton), The Priory, St. Mary's, and the Castle at Warwick, Honington Hall and Darlingscote, Stratford-on-Avon, and Kenilworth Castle were visited, but of these we have not space to give details.

Castle Bromwich.—This fine old home, built in red brickwork with stone dressings, was built during the latter part of the sixteenth century. On approaching it the first thing noticed is the porch. This is built in white and red stone, and projects 10ft. from the house; it consists of a brassen pediment supported on Corinthian columns, the two inner ones being twisted—two figures above represent Peace and Plenty. Running round the top of the house is a good balustrade, on which are four ornamental vases. This porch was added in 1672 by Sir John Bridgeman. On either are projecting wings. In the garden front are twelve large windows with stone mullions signifying the twelve Apostles, and four gables—the four Evangelists. Internally, there is some excellent oak panelling, and some of the door-heads are well worthy of notice, as is also the heavily moulded dining-room ceiling. A walk round the gardens, where the hollyhocks mingle with the roses and carnations in a wild cluster, amply repays the time thus spent.

The roof of the Working Men's Home, a lodging-house in Lee Lane, Horwich, fell in recently. Two men were injured.

A new station is being erected in Roath, Cardiff, by the Great Western Company. The contract, which amounts to £15,000, has been entrusted to the firm of Messrs. Mackay and Davies, of Cardiff, Newport, and Pontypridd. The site selected is in Pearl Street, near Splott Bridge.

MR. M. H. SPIELMANN contributes to the Daily Graphic an interesting article on Mr. Walter Crane, who, as the reader knows, has just been appointed Principal of the Royal College of Art. Mr. Crane has in him a good deal of his friend William Morris, and in character, the writer records, is scarcely less sturdy, independent, and original. His work covers an enormous field; he is a painter, a book illustrator for young and old, a decorator, a designer for stained glass and tapestry, paper-hangings, tiles, pottery, and textiles, a sculptor and a craftsman in many materials, an able lecturer, a fanciful poet, and a facile writer—one whose artistic taste is restrained and ordered by his clear-cut principles and logical and constructional mind. His triumphs have been many, won in many fields; and it is hardly too much to say that his work is known and his name is honoured even more and better in the capitals of Europe—at least in Paris, Munich, Berlin, and Brussels—than here in England, where yet he is esteemed so highly. His mind is of that order that, while in quite an unusual degree it belongs to the imaginative and poetic class, it is, nevertheless, possessed of the logical preciseness that is

NECESSARY TO THE SUCCESSFUL CRAFTSMAN, and that distinguishes the deliberate thinker and man of action. He was only sixteen years old when, in 1862, he contributed to the Royal Academy his first publicly exhibited work—a drawing called "The Lady of Shalott." It hung in what was called "the middle room," when the exhibitions were still held at Trafalgar Square, and since that day a perfectly feverish activity seems to have possessed him. We find him a serious author in such books as "Decorative Illustration" and "The Bases of Design"; a dainty and even opulent designer of the highest class in the pages of such works as "The Baby's Opera," "Flora's Feast," "Grimm's Stories," "The First of May," and, especially, "Spenser's Faerie Queen," with other books that will readily occur to the reader. Mr. Crane has even wandered into Punch's page. His pictures in oil, essentially decorative always, include "The Renaissance

of Venus," which belongs to Mr. G. F. Watts, "The Fate of Persephone," "The Bridge of Life"—many of them on an ambitious scale of size, in order to correspond with the bigness of the ideas illustrated; while his water-colour drawings—the best of them transcripts from nature, wrought on his travels about Europe—have for some years attracted attention on the walls of the Royal Water-Colour Society. His decorative works, whether ceilings, friezes, floors, or what-not, in every method and in every material, have beautified many rooms in England and America; and it is mainly as a decorator that he would be judged. And, as if all this work did not yield sufficient outlet for his energy and talent, Mr. Walter Crane has filled his odd time with writing magazine articles, with managing the affairs of the Arts and Crafts Society (of which he is president), with "examining" officially at South Kensington, "directing" at the Manchester Municipal School—from which, however, he recently retired—and more recently at the University Extension College at Reading. Mr. Crane's work and its characteristics are well known. In his

WALL PAPERS AND FORMAL DECORATIONS he shows some affinity with William Morris; in his female and his male figures with Albert Moore, and even at times with Burne-Jones; and it is not a little strange to trace in his work now the keen and intelligent sympathy with the Greek ideal of pure beauty, and now the fine Gothic passion for opulent decorative ornamentation. And yet, notwithstanding all this extraordinary versatility with this spreading of his energy over nearly every section of the arts and crafts, in which his inexhaustible invention and resource inevitably make themselves felt, we find ourselves asking whether the accentuated manner—it need not be called mannerism—of so forceful a character and so marked a genius will not, perhaps, despite his variety of subject, impress itself too strongly on the pupils in the schools. It is to be presumed, however, that one who has shown so much independence and originality of his own will insist on the same individuality in others, and that the wise rule of Mr. Sparkes will be maintained—with a difference—by his distinguished successor.

ARCHÆOLOGISTS AFIELD.

III.—IN SUSSEX.

THE Sussex Archaeological Society had an excursion to Ashburnham and Battle—places beloved by antiquaries and familiar to students of English history—a few days ago.

ASHBURNHAM CHURCH.

The archaeological treasures at Ashburnham Church include the massive Communion plate, presented to the church by its founder, John Ashburnham, Groom of the Bedchamber both to Charles I. and Charles II., and the parish registers dating from 1538. The chancel contains a curiously worded epitaph on this John Ashburnham, describing him as son of "that unfortunate person, Sir John Ashburnham." There is also, among other memorials, a fine sculptured tomb, in memory of Jane, Countess of Marlborough, who married into the Ashburnham family, and whose virtues are extolled in a high strain. An account of the church was given by the vicar, who said there had probably been a church on the site from the eleventh century, though the present edifice was built in 1663. The special features of the Architecture were the wooden mullions of the windows, and the seven steps from the floor of the tower to the nave, and seven steps again from the nave to the chancel, which gave the altar a very lofty position. In the hall at Ashburnham Place were to be seen the famous relics of Charles I.

BATTLE ABBEY.

Mr. W. H. St. John Hope described Battle Abbey. The abbey, he explained, was founded by William the Conqueror as the tardy fulfilment of a vow made before the Battle of Hastings. The site was on the very scene of the battle, and the high altar was supposed to have been placed on the very spot where Harold's body was found. The later history of the abbey was practically nil, except such as was written on its stones, for though part of it had been destroyed, sufficient remained to enable them to put together a fairly intelligible story. The abbey he described as of the normal Benedictine type, and he identified the remaining portions of the building as the guest-house, refectory, dormitory, infirmary, locutorium, &c., pointing out the special features of each. He particularly called attention to the fine gateway, the beautiful twelfth century work on the exterior of the guest-house, and the ruins of the dormitory. In the church, the Norman font and the splendid monument to Sir Anthony Browne, Master of the Horse to Henry VIII., were centres of attraction.

IV.—IN SHROPSHIRE.

The Cambrian Archaeological Association has been holding a meeting at Ludlow. Stanton Lacy was among the places visited. Here is a well-known church to ecclesiastical archaeologists, by reason of the undoubted Saxon work that is included in the building. In addition to this work, the peculiar characteristic of which is the use of flat pilasters formed of long stones, alternating with short ones, the church is interesting as containing several canopied niches built into the external walls of the fabric, and containing some mutilated figures. A peculiar stone, consisting of an ornament in the form of a square staff surmounting four parallel billets, which has been let into the wall above a closed Saxon doorway, is similar in character to the tympanum of one of the doorways of Portskewett Church. Culmington Church and Diddlebury Church were also visited. This latter church, though not so well known as that of Stanton Lacy, is, perhaps, of greater interest to antiquaries from the mixture of Saxon, Norman, and later styles perceptible in the edifice. The most interesting features of Holgate Church are a fine Norman font of excellent preservation, and a Romanesque south doorway. At the Heath was seen the most perfect example of a Norman church, which has remained practically unchanged since its erection. Richard's Castle, where are the remains of an early Norman fortress; the church, also, has several interesting

AROUND WARWICK WITH THE ARCHITECTURAL ASSOCIATION.

features of antiquity, came under survey. A small party went off to examine the church of Ashford Carbonell, an edifice containing much Norman work. The east end of the church is lighted by two windows, having the ordinary plain Norman rounded heads; above these is a beautiful oval window, technically termed a vesica. This, if contemporary with the lower windows, would be one of the earliest instances of the appearance of the pointed arch in association with that with rounded head. Until the restoration of the edifice, about fifteen years ago, these windows were hidden by plaster, and it was only at that period that the original form of the windows was discovered. The two parties united at Orleton, where is another late Norman church, which had been enlarged, probably, in the time of Edward I., as it is said that two beautifully-carved corbel heads represent the great King and his Queen, Philippa. At Shobdon the only old portion of the present church is the tower. About a century ago the owner of the

RUINS OF SHOBDON PRIORY

carted away the remains of several arches, which had survived the destruction of the priory church, and erected them in the form of a triumphal arch on the hill above the present church. The central archway was probably the arch between the chancel and nave, and the two side arches were no doubt doorways in different parts of the original building. Two tympana have been placed over openings between the central arch and that on its right and left. The arches are of the most elaborate Romanesque character, the sculpture with which every portion of the arches is covered possessing certain features which seem more Continental than English. Aymestry Church, which was also visited, consists of a nave, chancel, and nave aisles. Across the chancel arch runs a tall

OAKEN SCREEN OF BEAUTIFUL PERPENDICULAR WORK,

which is an evident insertion. It was stated that the screen had been put into the church about the commencement of the present century, and that it had been brought from a

church somewhere in the neighbourhood of Swansea or Neath. Colonel Morgan, Swansea, observed that about one hundred years ago the old Church of St. John at Swansea was taken down and replaced by a building in the poor taste of that period. It was well known that the old church was a fine edifice, containing some beautiful details, none of which had been perpetuated in the present church. The general opinion of the experts seemed to be that the balance of evidence was in favour of the Aymestry screen having come from old St. John's at Swansea. The members next proceeded to Wigmore Church, a large edifice, built in Norman times, but almost entirely remodelled in the Decorated period. The castle is a strong post, erected by one of the first members of the Mortimer family, but it has been so effectually dismantled that it is not easy to make out its ancient features. The fourth and last excursion took place to Bucknall, Coxwall Knoll, and back to Stokesay. The remains of the gateway of Bramfield Old Priory and the church, part of the original conventual church founded as a secular college in 1105, with two Norman arches, were inspected. On to Leintwardine village, a little to the left of the Roman road, Watling Street, the site of a Roman station, thought to be Bravinium, and where from time to time have been found fragments of Roman pottery, a bronze ring, and a third brass of Constantine the Great. To the south is Brandon Camp, with two valla, a counterwork of the stronghold on Coxwall Knoll. On to Brampton Brian Castle, which was built probably by Brian de Harley in the reign of Edward III., only the gateway and a fragment of the main building remaining. The next place visited was Coxwall Knoll, a mile to the north, where some writers say the decisive battle between Caractacus and Ostorius Scapula was fought A.D. 52. On the north and east side are entrenchments and an artificial terrace is cut along the brow of the hill. On to Bucknell Church, and then by train to Craven Arms, and visited Stokesay Castle, one of the finest examples in England of a castellated mansion of the thirteenth century, and then to Ludlow.

AROUND WARWICK WITH THE ARCHITECTURAL ASSOCIATION.

RUSKIN ON ART AND LIFE.

MR. GEORGE ALLEN publishes in a large quarto, beautifully printed on fine paper, the text of three "Lectures on Landscape" delivered by Mr. Ruskin at Oxford during the Lent Term of 1871. The graceful and luminous English in which the Slade Professor couched the artistic truths he wished to impress on his pupils renders these lectures as pleasant to read as they must have been delightful to hear. Through them may be caught the echo of a personal note, insisting on that quietness, earnestness, and simplicity which have been the speaker's ideal of nobility in the sphere not of Art only, but of thought and conduct. The lectures are entitled "Outline," "Light and Shade," and "Colour," and may be taken as epitomising Mr. Ruskin's views as to the general direction of study to be pursued by the landscape artist. It is not surprising to those familiar with his tenets and practice that in his first address he presses home the

IMPORTANCE OF ACCURATE DRAUGHTSMANSHIP:

"Most landscape painters have been tempted to neglect outline altogether, and think only of effects of light or colour on masses more or less obscurely defined. They have thus gradually lost their sense of organic form, their precision of hand, and their respect for limiting law; in a word, for all the safeguards and severe dignities of their Art. And landscape painting has, therefore, more in consequence of this one error than of any other, become weak, frivolous, and justly despised." In the second lecture the professor, going to Turner for illustration of his theories, dwells upon the due expression of gradation in landscape. His distinction between and comparison of the Greek and Gothic schools—as he christens them—is the subject of eloquent discussion, carried further in his third and most elaborate address on "Colour." The comparison is too familiar to need citation here; but for the satisfaction of Ruskin lovers we subjoin a quotation: "You know I told you that

THE PURE GOTHIC SCHOOL OF COLOUR

was certainly cheerful; that, as applied to landscape, it assumes that all nature is lovely, and may be clearly seen; that destruction and decay are accidents of our present state, never to be thought of seriously, and, above all things, never to be painted; but that whatever is orderly, healthy, radiant, fruitful, and beautiful, is to be loved with all our

hearts and painted with all our skill. I told you also that no complete system of Art for either natural history or landscape could be formed on this system; that the wrath of a wild beast, and the tossing of a mountain torrent were impossible to a painter of the purist school; that in higher fields of thought increasing knowledge means increasing sorrow, and every Art which has complete sympathy with humanity must be chastened by the sight and oppressed by the memory of pain." Because the "Gothic" style has never reached a fair condition of development, Mr. Ruskin urged on his young hearers that they should attempt to study with a view to carrying on the work for whose furtherance he looked in vain to the Pre-Raphaelites. To ardent youth, the accuracy of detail which can make the drawing of a single petal a beautiful thing seldom proves attractive; and the

CHARACTERISTICS OF THE GREEK SCHOOL,

as their teacher defined them, would probably fire to imitation the greater number among the lecturer's pupils. The "tragic horror and gloom" of the School of Clay may have struck the lecturer as inappropriate to the boyish minds and hearts reflected in the faces

before him, and have moved him to the declaration—characteristic of the speaker—that "as long as he could keep them there they should stay—among the almond and the apple-blossom." "I wish you therefore to begin your study of natural history and landscape by discerning the simple outlines and the pleasant colours of things; and to rest in them as long as you can. But, observe, you can only do this on one condition—that of striving also to create, in reality, the beauty which you seek in imagination. It will be wholly impossible for you to retain the tranquillity of temper and felicity of faith necessary for noble purist painting, unless you are actively engaged in promoting the felicity and peace of practical life." The extracts for which we have found room will give some idea of the dignity of thought and language for which the Oxford undergraduates had to thank the Slade Professor. These three lectures are, indeed, replete with noble imaginative utterances.

RE-PAVING LONDON.

THE complete re-paving of the Strand is now in progress. For the past week or two the observant wayfarer near the Savoy and Somerset House, whose "Front looks down on all the pride and business of the town," has watched the construction from blocks of pitch-coated teak or Jarrah of a series of barricades upon the pavement, deep enough to suggest immunity from artillery attack, but obviously so easily displaced that a light framework of thin laths has been nailed along their outer edges. First, of course, the existing roadway has been torn up. Then came a period when the foundation of the road underwent treatment, and lastly, with all deliberation, and a complete absence of anything approaching to speed of execution, the cubes are laid with an

ACCOMPANYING DRESSING OF TAR.

A coating of sand and gravel will be permitted ample time to "work down," and, as the days of autumn are well advanced, the Strand may once more be open to the use of wheeled vehicles. Now, the average citizen who knows that streets must at intervals be re-paved would bear this visitation with greater equanimity were the parallel thoroughfare of Holborn in a fit state to receive its share of the overflow traffic. But at the present time it is not too much to say that Holborn is being submitted to a process of complete transformation. The pedestrian going eastward from Tottenham Court Road finds that if the General Post Office has at last taken possession of its fine new West Central branch, its old premises at the corner of Southampton Row are under-

ON TOUR WITH THE ARCHITECTURAL ASSOCIATION. CHAPEL STREET, STRATFORD-ON-AVON.

going demolition, and here will be found a chronic block between scaffolding, carts

LADEN WITH BROKEN BRICKS,

and holes to reach various pipes and connections. Proceeding to the very narrowest part of this great artery—namely, where Red Lion Street debouches into it, something more than half the roadway is “up,” and excavations of considerable depth are being made, while it may be added that the effluvia from sewers laid bare about this point is frequently of the most offensive character. Omnibuses and other vehicles can only pass in single line, and the delays and stoppages are extremely annoying to busy people. Opposite Chancery Lane, where one of the stations of the new electric railway from Shepherd’s Bush to the Bank is to be situated, underground works of the most extensive description have been going on for months past, and show no signs whatever of approaching completion. In fact, a kind of wooden structure of solid beams and boards, roofed with tarpaulin, has recently been reared right across the north side pavement and far into the road itself. Meantime, on the south side, the frantic announcements in the shop windows of “compulsory sale,” “stock must be cleared,” and so on, in addition to boards enormously lettered to the effect that these buildings will be superseded by the Holborn frontage of the Birkbeck Bank, whose somewhat garish Architecture in Southampton Buildings is almost finished, tell of considerable further stoppage in the ordinary flow of street business. At the extreme south end of Gray’s Inn Road blocks caused by work of more or less magnitude have been incessant for weeks past, and the destruction of Fumival’s Inn in the absorption of its site by the Prudential Assurance Company foreshadows much building in the near future and interruption at this point. Meantime, Fetter Lane is in the hands of asphalt layers, and conspicuous warning of “No thoroughfare” stands at either end. Even the narrow passageway of Shoe Lane is threatened, as some of its dingy old houses are under the immediate doom of the march of improvement. The whole of the east end of Queen Victoria Street, from Cannon Street to the Mansion House, is raided off, and being repaved, with the exception of a narrow strip wide enough for a single file of hansom on its south side. During this stoppage the omnibuses from the Strand and Fleet Street are sent down Cheapside, where the congested state of the thoroughfare recalls the conditions which prevailed before the City Police exercised their authority, and divided them at the Mansion House from those whose route lay along Oxford Street. At the Bank itself matters are

TEMPORARILY BETTER

than they were, and it is only fair to say that west of Piccadilly Circus there are few interruptions to speak of, a state of affairs which rather suggests, however, that the West End and South-West vestries try to time their repairs to take place when the residential quarters are in crowded occupation. The obvious conclusion seems that some sort of board should be formed from among the local authorities who are charged with the maintenance of our roads. It is perfectly scandalous, for instance, says the Daily Telegraph, that two such main highways of London’s commerce as the Strand and Holborn should be permitted simultaneously to be “up”; for, though the latter is not nominally in this condition, the blocks allowed there make it practically so. Another strongly urged point is that road repairs, involving, as they do, such enormous inconvenience to shopkeepers, as well as those passing to and fro upon their “lawful occasions,” should be carried on by night as well as by day. With three shifts of men working eight hours each it would be possible to accomplish the tasks in one-third of the time now occupied. There need be no insuperable difficulties for vestries to overcome in making this an essential condition of contract, and the ratepayers have assuredly the right to demand that the period of disorganisation and chaos shall be reduced to the minimum.

IN THE HARTZ DISTRICT.

By G. A. T. MIDDLETON, A.R.I.B.A.

V.—HILDESHIEM.

HILDESHIEM is proud of being called the Nuremberg of North Germany; and she is rapidly depriving herself of all claim to that title, founded as it is rather on both cities being full of picturesque old buildings than of any similitude between them; for the old work is being pulled down to make room for new at a pace quite unparalleled in any other town I know. No less than six works of demolition within a radius of 100 yds. are going on at the present time. At this pace there will be no Hildeshiem worth seeing by the architect and the art lover three years hence, and what remains now is clearly but a tithe of what existed a decade ago; so that all who wish to understand what a mediæval city really looked like must make haste, and take their tickets at once; or else they will have to go further afield, and visit Rothenburg, for Nuremberg has already suffered irreparably in the same way. After all, the journey is not a great one, and, taken *viâ* the Hook, not a tiring one either; and Hildeshiem is well worth visiting, sketch book in hand. Fortunately, it was the last place visited during the tour; had it been the first all others would have appeared tame.

The Dom—the former cathedral—alone is a disappointment, it being a modern reconstruction; and yet not wholly a disappointment either, for of the old Romanesque work there are still two magnificent remains, one being a column and cap, sculptured all over after the manner of the Trajan column, and known as the “Christus Pillar,” the scenes represented being taken from our Saviour’s life; and the other being a marvellous pair of bronze gates, covered with figures which project from its surface. How this has been done is somewhat of a puzzle, but I am inclined to think they were cast separately, and have been brazed on. The iron gates to the northern portico are also noticeable, though their date is uncertain. The scroll work is in the favourite rod iron with flattened leaves, the junctions with the frame being by means of riveted staples; the compound junctions formed of wrought human figures; and other joints being some of them welded, some riveted, and some mere connections by twisted strands of iron wire. Some iron of a very similar character, apparently the work of the same smith, is to be found in the grille over the north door of the Andreas-Kirche, the flat central band of which is worked in *repoussé*—or was, for the pattern is now difficult to decipher—and having the terminals of the leaves most curiously intertwined, but the human figures are absent, and the connecting staples are covered by rosettes.

While on the subject of metal, mention may be made of one of the most curious door knockers I have ever seen, to be found on an unused door in the Rath-haus Strasse, made of bronze, and worked into the form of grotesque human faces.

The Andreas Kirche, besides its ironwork, has most stupendous crockets to its small north and south doors, while the flying buttresses are of eccentric construction, being supported midway. They suggest the flying buttresses of Amiens Cathedral, but there the support is vertical and near to the main wall, here it is central and arched. After all, however, the principal attraction is the Market Square, with its central fountain and quaint buildings all round, grouping well in all directions, and of all dates. One, known as the Templars’ House, is of a curious late false Gothic, yet eminently picturesque in spite of its want of truth to style, inset into which is a fine Renaissance bay, with its lower part ruthlessly cut away to make room for a modern shop window. Possibly the ornament is overdone, and the proportions not all that they might be in delicacy, but seen in position it is decidedly charming.

About the timber houses so much has been said when writing about other towns, that little remains to add. Several had been

enlarged at various times by the throwing out of bays and oriels, generally of carved wood-work, and here and there a minor detail of some interest could be seen, such as a scroll band of the broad-leaved German foliage, or a specimen of interpenetration, while lettered inscriptions are frequent, with the capital letter beautifully formed.

The fact of so much demolition going on gave an opportunity to observe the construction of some of the old houses now exposed to view. A great deal is done by central support by posts carried right down to the ground, and by collars carried right across; but of framing there is scarcely any, even the overhanging of upper stories being very simply continued on the dead weight principle. Of the open space in the roof no use seemed to be made, in spite of the suggestion of floors by the appearance of external dormers, which, if used at all, were connected down by shoots to light portions of a lower floor. The timbers are strong, but widely spaced, the rafters being a full 2 ft. apart, with tile-laths 2½ in. by 1½ in. to carry the heavy tiles, and obviously the fire risk is considerable. There is consequently a substantial argument in favour of rebuilding, while another of even more moment is to be found in the state of the subsoil, which, when excavated, is found to be little else than the accumulated sewerage of centuries, which has to be completely removed before a new building on the site is commenced; in fact, it would not carry a brick or masonry structure, to say nothing of its unhealthiness.

A great deal of this reconstruction is being done piecemeal to avoid the regulation which would compel the setting back of frontage line if all were rebuilt at once; the lower portion being first “repaired,” while the upper is supported on needles, and then the upper part removed and “renovated” a few years later. But wherever work is going on it is being rapidly pushed forward. With no trade unions to limit the work done by each man to the capacity of the weakest, with plenty of hands and a sharp foreman, a building in construction looks like a busy ant hill; and the work is not only rapidly done, but strongly also, material being by no means spared, though somewhat roughly put together where not exposed to view; bricklayers seem to have little compunction in laying a two-brick wall direct without footings on the hard subsoil when it is reached (or on the doubtful, if the architect’s back be turned), or of carrying a wall 10 ft. or even 12 ft. higher in some parts than in others. Iron, too, is largely used in modern construction, thrown in, one would imagine, without previous calculation, save that of a rough rule-of-thumb, allowing a very ample margin indeed for stability. In fact, soundness is achieved by mass rather than by scientific means.

The ancient walls surrounding the historic borough of Conway were reopened on Friday week, after restoration.

A block of waiting rooms and offices is being built on the up platform at St. Neot’s railway station, Hunts. The contractors are Messrs. Kirk, Knight, and Co.

The chancel of St. Mary’s Mission Church, St. Helens, Lancs., has been redecorated. The adornment of the chancel was carried out by Mr. Freeman, of St. Helens.

At Boxmoor, Herts, a new Roman Catholic Church has just been opened. Mr. G. Harvey was the architect, Mr. Payne the builder, and Mr. Hales carried out the decorations.

The chief feature of recent business at the Tokenhouse Yard Auction Mart was the appreciation for building estates. The most important of these was the Knott’s Green Estate at Leyton, which has frontages to existing roads of over 3700 ft. and an entire area of over 100 acres, and fetched about £600 per acre.

PRINCESS LOUISE has made considerable progress with the model of the statue of the Queen which she has undertaken to execute for the west porch of Manchester Cathedral. The work represents her Majesty in robes of State at the age which she had attained when she opened the Art Treasures Exhibition at Manchester in 1857.

AN OLD HOSTELRY REBUILT.

THE rebuilding of the Crown and Anchor Hotel at Ipswich is an enterprise of interest to all who know the old town. It is one of the ancient hostelries of an ancient borough, the title deeds of the property dating back to the year 1523. The architectural style of the new building is described as Flamboyant Domestic Norman. So far as the façade is concerned, it has been accommodated to the chief characteristics of the old front, so that the associations connected with a familiar appearance have not been obliterated, but improved upon and dignified. The entrance, closed by studded doors of an antique type, is of imposing breadth and height. It is surmounted by an archway and balcony, supported upon clustered black marble shafts, with carved capitals, and having the name of the hotel above it in open stone work. The whole elevation is carried out in white or creamy white stone. The more conspicuous features are three projecting bay windows to the two upper stories, with circular shafts at the angles, and

QUATREFOIL TRACERY

under the balconies, the upper panels of the windows are carved, and the design is harmoniously crowned and completed by a pierced parapet, with crocketed terminals and dormer windows. The open space between the bays is broken and adorned with various devices, including medallions showing the Crown and Anchor, and a carved panel in which the same symbols are differently represented, guarded by heraldic lions. The interior of the hotel is eminently suggestive of a general planning out in which considerations of comfort and luxury are combined with solidity and spaciousness. The vestibule and hall are laid with tessellated pavement, and covered in part with rich Turkey carpets; and lounges, upholstered in the best morocco leather, are here provided, together with such necessities as letter-boxes and brush-stands, all in carved oak. As in most modern hotels,

THE HALL

itself is made a comfortable place of resort, but the hall here is practically extended into a cosy apartment, on the right-hand side from the doorway, which affords an "occasional" meeting-place, and is unique in its way. Fronting the entrance, behind a handsome mahogany partition, there is an inquiry office; in the rear is a private bar, and this suite of offices, right in the centre of the building, also includes a private room from which the whole of the ground floor may be kept under observation. The commercial room, which is approached from the right hand side of the entrance hall, and faces Westgate Street, is of large dimensions, measuring 30ft. by 22ft.; it is correspondingly lofty, and the ceiling is deeply panelled. The walls are covered with embossed Japanese paper, in a rich design of red and gold, with a Lincrusta dado, and a Japanese gold frieze. The coffee room is on the other side of the entrance hall. The Japanese wall-paper is of sea-green, in contrast with the embossed gold pattern, and the frieze is of red gold. The apartment which shows more original characteristics than any other is the smoke room, the entrance to which is through an ornamental screen or lobby to the left of the inquiry office. The fireplace is lined with Dutch tiles, with pictures thereon of vessels appropriately broad in the beam; the overhanging chimney-piece is built of fumed oak; there is a wainscoting of the same wood, strangely varied in graining, all round the wall, 7ft. 6in. high, with a heavy Tyne Castle frieze above it; the chairs are also of fumed oak, together with the tables, and the windows are of old English lead lights, with fanlights above, opening inwards. Throughout the whole building fine artistic feeling has been shown.

PLANS of proposed new county police buildings in Crief have been passed by the local Dean of Guild Court. The buildings are to be in the Scotch Baronial style, and will be two stories in height, with attics.

BRIDGE BUILDING EXTRA-ORDINARY.

IT does not often happen that a few hours witness the complete removal of an old railway bridge and the substitution for it of a brand new structure, over which heavy express trains can run with perfect safety. Yet this feat of engineering has just been accomplished with remarkable neatness and celerity at the Finsbury Park Station of the Great Northern Railway. The precise point is that at which the Stroud Green Road is crossed by three separate iron bridges, which are a continuation of those over the Seven Sisters Road, and support one end of the station itself. In the early part of the present year the directors of the line decided to replace the middle bridge of the three, and

TO ALTER THE CONSTRUCTION

in such a way as to leave the roadway beneath clear. The old bridge was supported upon heavy brick piers at the edge of each footway, but the new one is a single-span girder erection, so strongly made of steel as to be capable of bearing with ease the enormously heavier locomotives and carriages which are nowadays in use. Yet the task was by no means easy. It had to be carried out without disturbing the traffic either on the railway above or the road below, and therefore the plan sometimes adopted of building the new bridge all ready to be slipped, as it were, into the place of the original crossing was utilised, and with great success. Messrs. Handyside, of Derby, were entrusted by the Company with the contract, and they commenced the work in March. First of all, a very

SUBSTANTIAL KIND OF SCAFFOLDING

was built underneath the bridges on either side of the road. This erection was composed of baulks of timber about 1ft. thick each way, and calculated to bear the great weight which was to come upon it eventually. Next a miniature railway was laid along each scaffold, which, of course, ran nearly at right angles to the bridges. Then the building of the new bridge was commenced. It was constructed of heavy steel girders and plates, all bolted and riveted together, and each end of it lay upon a series of small-wheeled trucks which in their turn rested upon the scaffold railway. The bridge was fully equipped with a permanent way ready to be joined up to the main line directly it should be in proper position. Although it does not take long to recount the process of preparation, the affair was really a difficult one. True, the

SPAN OF THE BRIDGE

was not long, but the contractors were a great deal hampered by the presence of the other two bridges on either side of them, and the very narrowness of the Stroud Green Road formed an obstacle to speedy construction. However, on Sunday afternoon last everything was ready for the main operation, that of taking away the old bridge and shifting the new one bodily into its place. This task was commenced at three o'clock in the afternoon. First of all powerful steam cranes, specially erected for the purpose, hoisted out the condemned iron girders, which weighed some ten tons each. A very short time elapsed before all these were taken away, and for a while there was a blank space. Next ropes were attached to the new bridge, and steam winches were set to work to haul the structure slowly along on the little carriages at either end, until, in less than half an hour, the break of continuity in the railway was repaired, and when the metals on the bridge were connected to those on the main line, it was again possible for trains to run over, which, as a matter of fact, they actually began to do about eight o'clock in the evening. Naturally a great deal remains to be done before the business is entirely finished. The brick piers in the roadway have to be demolished, and the ends of the bridge built up so as to form a continuous part of the line, but yesterday a heavy express train was seen rushing across at considerable speed, and apparently the erection was as sound and staunch as though it had been there

for years. The replacing of the Stroud Green Road bridge is only the latest of

A SERIES OF ENGINEERING FEATS

which have been carried out during the past few years. A bridge over the Uxbridge Road on the North London Railway was renewed in a similar manner in about two hours. But one of the best achievements of the kind was effected a couple of years ago, when a bridge on the Great Eastern Railway was cleared away and a new one substituted in a very few hours. In this case the difficulty of the job was enhanced by the fact that the line at the point in question crossed a river, and that it was on the skew or slant. Yet the whole thing was done without a hitch. The principal secret of success lies in the proper construction of the small railway which supports each end of the bridge, and upon which, when the time arrives, the vast mass, weighing perhaps hundreds of tons, is to be transported to its resting-place. Modern steam cranes, winches, and hauling gear also give facilities, which, in the early days of railroads, were quite unheard of.

KEYSTONES.

THE Parish Church of New Alresford, Hants, has been restored at a cost of £6000.

THE Bishop of Menavia has laid the foundation stone of a new Roman Catholic Church, in Conway Road, Colwyn Bay.

THE organ in St. Mary's Church, Chester, built in 1887, has been enlarged by Messrs. Gray and Davidson, of London.

IN the list of the new commission of the peace for Blackpool the name appears of Mr. Butcher Mather, architect, and also those of three local builders and contractors, Messrs. James Cardwell, Thomas Houldsworth Smith, and James Ward.

A NEW two-story building at Falkirk recently collapsed. A large portion of the building fell into a neighbouring churchyard and damaged a number of tombstones and smashed the iron railing surrounding the burial ground.

INCLUDED in an extensive estate at Muswell Hill, to be let for building purposes, is a cottage known as "Lalla Rookh," where Thomas Moore, the poet, lived, and wrote at least part of the poem of that name, which was published in 1817.

A NEW Conservative club has been erected at Barnoldswick. The premises are located in the principal street of the town, and form a notable addition to a place somewhat lacking in public buildings of any architectural pretensions. The total cost is £3000.

A NEW ward is being added to the cottage hospital at Warminster. The wing, which will be built of Frome stone with Bath stone dressings, will contain a men's ward to hold five beds, two probationers' bedrooms, servants' rooms, baths, lavatories, and other offices.

THINK of a see-saw 600ft. long, that will carry a load of passengers from the ground to a height of 100ft.! Such a machine has been invented and patented in Europe and America by Mr. Imre Kiralfy, and will be offered to New York City for erection in Central Park. The structure will consist of a central steel tower 400ft. high. Securely resting on bearings 225ft. above the ground will be poised in exact balance the giant see-saw, which will extend the enormous length of 600ft. Like the tower, the see-saw will be of steel. Below the see-saw, a little less than half-way to the ground, will be a grand promenade, and above it, half-way to the top of the tower, will be a restaurant, from which a magnificent view can be had; but for the view of views, which will surpass any now existing, the spectator must ascend to the watch tower at the extreme top of the turret. The motion will be so gentle as to be hardly perceived, and will be very readily accomplished, for the exact balance of the see-saw, with friction reduced to a minimum, will make it possible for a very small preponderance of weight at either end to raise the other. On the see-saw will be rails, carrying cars, worked either by cable or rigid wheels.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 24th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It is certainly full time that London paving authorities consulted together on the question of establishing uniformity of surface through the metropolis. In that respect we stand much where we did years back. Macadam and setts are now more rarely met with, but the struggle for supremacy between wood and asphalt goes on as merrily as ever, much to the injury of horses and to the exasperation of their owners and drivers. Ever and anon, a vehement protest finds its way into the papers, and equine experts explain how trying it is to horses drawing vehicles to change constantly from one surface to another. But most "authorities" are perfect Gallios for treating complaints thus made public with indifference, and those who look after the paving of London are by no means free from that little weakness. There exist, too, very unneighbourly relations between many of them, as is shown by the fact that when boundaries meet, the respective authorities appear to derive pleasure from agreeing to differ on the question of surface. Occasionally it even happens that a different material is substituted for one long in use, apparently for no better reason than that the continuous authority has adopted the latter. These eccentricities were pardonable when London had not sufficient experience with the various kinds of paving to determine which was the best. But that excuse no longer serves; the several sorts have been exhaustively tried in all parts of the metropolitan area, and there ought not to be much difficulty in arriving at a final decision if the numerous authorities only gave their minds to the matter.

The stones and ironmongery of Mazas Prison, Paris, have been sold by auction. Buyers proved considerably less keen on the proffered bargains than the authorities had expected. The 1200 prison keys for sale went for a song, the most interesting specimens fetching only 5*f.* apiece. Some purchasers bid for the doors. The authorities of the Carnavalet Museum, who possess a door of the old Bastille, thought of buying one of those at Mazas, but on reconsideration these were not thought interesting enough to figure in a collection. From rather a morbid point of view the most curious features in old Mazas were its walls. These were covered with inscriptions, some cynical, some pious, some by prisoners vowing vengeance on their keepers, others by repentant criminals praying for their sins.

It is in contemplation by the Benchers of the Inner Temple to acquire the old premises situate at the north side of Hare Court, Temple, so long known as Dick's Coffee House, for the purpose of erecting new chambers thereon. It may be recollected that the same authorities recently endeavoured to obtain the requisite permission from Parliament to erect new buildings in continuation of King's Bench Walk, near the Temple Gardens, but were not successful.

The conservatory in Sefton Park, Liverpool, has been considerably enhanced by the erection of some fine pieces of marble statuary, and there is a likelihood that ere long another example of the sculptor's art will be placed there. The Parks and Gardens Committee of the Corporation has been informed that the executors of the late Mr. James Barkeley Smith have approved of a suggestion that a statue, named "The Angel's Whisper," should be placed in the palm house in Sefton Park.

The interesting old mansion house known as Wester Livilands, near Stirling, is about to be demolished to make way for a new house to be re-erected on its site. Livilands is famous in local history as being the residence of General Monk during the siege of Stirling Castle by Cromwell. The most interesting thing about the house that has yet been discovered is a series of panels showing paintings of the Sybils, with prophetic verses of the life of Christ in a curious mixture of Gothic and Roman lettering.

ANOTHER interesting piece of Old Hampstead is about to disappear. Wentworth House, John Street, and its grounds, associated with memories of Keats, has now practically fallen into the builders' hands. It was in this house that much of "Hyperion" was written, and nearly the whole of the "Odes." In the garden attached to it Keats heard the song of the nightingale that inspired his famous poem, and it was there that he was nursed through a long illness by the girl to whom he was so passionately attached.

The London County Council has issued a circular letter to the Metropolitan Vestries and District Boards, pointing out that though the majority of the local authorities of London expressed their approval of the suggestion of their Fire Brigade Committee made recently, that the positions of fire alarms should be indicated by metal hands affixed to lamp-posts, only a few of them had actually adopted it. The Council therefore suggests as an alternative that where a street lamp is close to a fire alarm it should be painted a bright red colour, as is now done with the lamps nearest to the four-mile cab radius.

SOME ancient buildings in and near High Holborn are about to be utilised by the Birkbeck Bank for the purpose of its new offices. These comprise the houses on the west side of Staple Inn, and stand on the site of Southampton House, the town residence of the Earl of Southampton, who was Shakespeare's patron and friend. The place was also the home in her youth of that Rachel Wriothesley who was afterwards the wife of the unfortunate Lord William Russell, whom she survived for forty years, dying in 1723. Close by is the site of the Templars' first church in London.

AN effort is being made to raise funds for the rebuilding of Bolsover Church. It may be interesting to briefly sketch the history of this church. Our Saxon forefathers worshipped in a primitively constructed building, of which some parts have been preserved until the present day, and are incorporated with the new building. In 1020 a complete stone church was built, and 180 years later this building was demolished, and another—in the Early English style—was erected. For 600 years this edifice stood—the sanctuary to which men might withdraw from the clang of arms, the clatter of hoofs, and all the turmoil and internal strife which the country witnessed during the Plantagenet, Tudor, and Stuart dynasties. In the year 1878 the building was thoroughly restored at a cost of nearly £6000. The old 1020 chancel arch being, to a large extent, buried in the north wall, this was removed to its proper place, and with some other stone formed the beautiful chancel arch. As recently as 1896 £400 was expended in beautifying the interior. In the early morning of January 24th, 1897, the church was discovered to be in flames, and although everything was done that could be done, without water, to subdue the conflagration, it was only when the material that would burn was

demolished that the fire died out. Consternation prevailed amongst the worshippers, but the vicar of the parish at once set to work to raise money to rebuild the church, and others came forward with assistance, so that a building committee was formed, consisting of Mr. F. J. Turner (agent to the Duke of Portland), the vicar, the churchwardens, Messrs. Simken and Tatlow, and the work was placed in the hands of Mr. Louis Ambler. The contract was let to Messrs. Bowman and Sons.

"WITHIN the last thirty years," writes a correspondent, "many patents have been secured for making wood incombustible—many of them have been put to, and have successfully stood, the severest tests—the difficulty has been the prevention of rotting, and the influence of the agent used in attacking and corroding iron. Until the system has been tested for, say, six years, it cannot be said to be successful in preventing the serious drawbacks mentioned."

THE Bishop of Bristol recently held a conference with the vicar and churchwardens of Malmesbury and the mayor of the borough, on the subject of the Abbey Church. The unanimous opinion was that the restoration of the ancient fabric must be taken in hand without delay. The work will be to make quite sound the fabric of the six bays of the nave which form the parish church, to make the interior more dignified as a place of worship, and to protect the ruined parts as far as possible from further decay. The ruins are the result of accidents before the Reformation. The central tower fell in consequence of a lofty and heavy spire being placed upon it in the later Middle Ages, and only the west and north arches of the tower and a small part of the transept walls are now left. At the west end, the north half of the great western façade and the north side of the three western bays of the nave fell long ago. The southern half of the front and the south walls of the three western bays remain fairly complete; but decay has set in to such an extent that the ruins, it is believed, will not long remain as they are if not attended to. The bishop has undertaken to obtain a preliminary survey of the fabric from an antiquarian point of view, to be followed eventually by a complete report. It is suggested that the chancel should be rebuilt, and also the three western bays of the nave.

THE Dean of York has issued the following statement in connection with an appeal for funds for carrying out the extensive repairs needed in various parts of York Minster: "The work on the south side of the nave has been completed, and the grand pinnacles restored in all their pristine beauty. This has been most carefully carried out, all existing details have been preserved, and those which have crumbled away as far as possible accurately reproduced. The cost has been very heavy, but the additional offertories have in some degree helped to provide for the outlay. Now the scaffolding has been removed to the east end, and another equally expensive and necessary work begun. The report of the clerk of the works, which is appended, will give some idea of the extent and importance thereof, and we trust that all who value and appreciate the beauty of the Minster will not only watch the work with interest, but contribute as God has blessed them to the restoration of His House, for the ordinary funds at our disposal are quite inadequate for this severe strain upon them. The work at the east end will be completed in about twelve months; then we shall commence a similar work at the west end, where immediate attention is required to the ornamentation thereof, much of which is in a dangerous condition. Several portions having lately fallen, a rail has been fixed round the west end, and all persons are advised to go within it as little as possible."

THE report as to the repairs necessary is as follows:—"The parapet is in a very bad condition, and is leaning outward. The pinnacle over the apex of the east window is in a

dangerous condition. This pinnacle is supported partly on the outer parapet, and partly on the roof gable; the space between the parapet and gable being vaulted. The weight of this pinnacle, which is about 20 tons, has thrust the parapet out of perpendicular. In consequence of this the joints of the vaulting have opened out, allowing the keystone to drop. The pinnacle must be taken down, the parapet and roof gable must be strengthened, the vaulting restored, and the pinnacle properly bonded and refixed. There appears to have been a pierced parapet to the roof gable which has been removed at some time, and plain coping substituted. The parapet should be restored. The crocketed gables and finials and small pinnacles at the base of the spires to angle turrets are in a very bad condition, being very much decayed, and in addition to this many of them have been fixed with iron dowels which have split up the stones. These dowels should be removed, and all the finials, &c., which remain, should be properly fixed, and new finials and pinnacles added where needed."

APROPPOS the demolition of the gaol of Newgate and the Old Bailey Sessions House, it is interesting to recall that in William the Conqueror's time a gate known as "Chamberlain," or the "Chamberlain's Gate," stood across the street at a spot between Warwick Lane and the present prison. This, rebuilt in the reign of Henry II., or his successor, was in the reign of Henry III. in common use as a gaol. In the year 1400 Henry IV. committed it by charter to the care of the Corporation. Sir Richard Whittington, moved by the ruinous state of the fabric, instructed his executors to rebuild it, which was done upon the customary plan. After undergoing in addition, some repairs, and refronting, at various periods, the old buildings gave way to new ones designed by George Dance, R.A., the first stone of which was laid by Lord Mayor Beckford on May 31st, 1770. Before they were finished they were pillaged and burnt on June 6th and 7th, 1780, by the No Popery rioters, and after that a sum of £30,000 was devoted to repairing and completing the fabric, which is considered by experts to be admirable in design and character. The outer walls are nearly 4ft. thick. On the opening of Whitecross Street Prison in 1815 Newgate ceased to be used for debtors, and since 1882 it has only been utilised for those awaiting trial during sessions, and for prisoners condemned to death.

THE new Sessions House will be built from plans prepared by Mr. Andrew Murray, the City surveyor, and will be carried out at an estimated cost of £120,000. As the Corporation have to pay £40,000 to the Government for that portion of the prison which came under Government jurisdiction by the Prison Act of 1877, and belonged to the Government—viz., that at the Newgate Street end, known as the "male wing," it follows that the cost will be enormous. At present merely sketch plans have been submitted to the particular judges whose approval is necessary before any elaboration of them can be attempted. The entrances to the courts and offices will be from the Old Bailey. The site is a very difficult one to deal with, being a plot of ground with an extended frontage and no access from the rear, and very little depth from back to front; consequently the whole plan has to be spread out laterally.

AN influential movement is on foot in the City to seize the opportunity offered by the renewal of the churchyard behind St. Giles's Church, Cripplegate, necessitated by the recent disastrous fire, to add this formerly pretty and quiet spot to the list of City gardens. This churchyard is from its situation more restful and peaceful than the majority of the old graveyards, which have of late years been utilised for the benefit of the living, and it is felt that this spot would be an ideal one for the erection of a statue or other memorial of Milton, who lived in the parish, and whose body rests in the grand old church which has now twice escaped the ravages of fire. Many of the parishioners of St. Giles are actively

interesting themselves in the project, and there can be no doubt that the necessary money for a Milton memorial would be at once forthcoming.

DIRECT railway connection between the metropolis and the most attractive part of the North Cornwall coast has now been established, the London and South-Western Company having extended its Holsworthy branch line to Bude. The approach is thus made to the centre of the wild and rocky shore which lies between Hartland Point and Padstow, a district which has hitherto been accessible only by coach. By means of the improved connection it will in future be possible for a traveller to reach Bude in about five hours and a half from Waterloo. Considerable difficulty has attended the construction of the railway, but it has been completed by Messrs. John Aird and Son in little more than eighteen months. The railway was designed by Mr. W. R. Galbraith, the consulting engineer of the London and South-Western Company, and carried out under his personal supervision and that of his partner, Mr. R. F. Church. At present only a single set of rails has been laid between Holsworthy and Bude, but the general character of the line is such as to permit of the fastest speeds being attained. The lofty viaducts over the Deer and Woolston valleys have been planned with the idea of doubling the railroad when necessary.

A KIEFF paper reports some interesting archaeological discoveries recently made in that province on the estate of M. Khanenko, where there are several of the Kurgans, or turtle-backed burial mounds, so common in many parts of Russia. The chief find was a cup, in form and design identical with the unique cup from Kul'-Ob', and unique itself in that it is of gold. A well-preserved Greek vase, with scenes from the mythology, and three gold plates for decorative purposes, engraved with amongst other subjects, strange animals, similar to those found on plates dug up in the Province of Perm and in Siberia. The greater number of the kurgans proved to have been already ransacked, but the discoveries, as described by the paper, appear to have been many and important. A Greek bronze helmet with traces of gold inlaid work, was found close to the skeleton of a Scythian warrior, who lay with his bronze arrows and quiver strewn about him, and a slave lying across at his feet. Several skeletons of women were unearthed, all having ornaments of various metals about them. One lay beside a large oval slab of stone, evidently intended for sacrificial purposes. The largest of the burial places found beneath the kurgans has not been examined yet, so it is probable other finds may be made.

VANDALISM receives a well-merited check by the refusal of the Light Railway Commission to accord powers for the construction of the proposed line connecting Lynmouth with Minehead, to which we referred last week. The lovers of the beautiful had a right to be heard in the matter. Their objections to the disfigurement of Countisbury Foreland will be endorsed by everyone who has ever visited the neighbourhood; while the encouragement which the advent of a fresh railway would give to the adventures of the speculative builder is a thing to be deprecated by all those who do not wish to see the lovely woods in the valley of the Lynn cut down to make room for "eligible villa residences."

THE furniture and effects of Ridler's Hotel, Holborn, have been sold by public auction, the site being required for the extension of the premises of the Prudential Assurance Company, which has already absorbed Furnival's Inn, in which Charles Dickens lived at the time he began to write the "Pickwick Papers," and the ground on which stood the old houses in Brooke Street, in one of which the unfortunate Chatterton poisoned himself. Ridler's was one of the few remaining inns which London could show as an example of the hotel patronised by the well-to-do in the early part of the century.

THE Deal Corporation has had under consideration a serious danger which menaces the town from sea encroachments, and have decided to at once proceed with important new works of defence near Sandown Castle, at the north end of the town. The Surveyor to the Corporation stated that unless these works of defence were undertaken at once the advance of the sea will undermine the existing wall and cause it to collapse. The urgency of the matter was also emphasised by the Town Clerk, who said he had visited the spot, and the state of things so alarmed him that he had written to the Board of Trade pointing out that the whole of Deal was likely to be submerged if the wall went. The sea-wall was much damaged by the heavy gales of several months ago, which carried away the shingle to such an extent as to leave the foundations exposed.

THE ancient bridge across the Tweed at Berwick, towards the maintenance of which the Corporation of Berwick receives an annual grant from the Government of £90 9s.—a grant which evidently does not meet with the approbation of Mr. Labouchere, who objected to it in the House of Commons the other evening—has a very interesting history. The amount of the grant is really £100, but deductions for Government stamps, fees, &c., reduce it to £90 9s. Owing no doubt to the fact that the bridge spans the stream which separates England and Scotland, and provides a means of communication between the two countries, it has occupied a peculiar position. It was built by the Corporation of Berwick, by permission of King James I., the funds being chiefly supplied by the Crown. Thirteen years were spent in its erection, it having been begun in 1611 and opened in 1624, and it is said to have cost £15,000. Subsequently the Corporation presented a petition to Charles II. for a grant for its support, and on July 23rd, 1667, Charles, by letters patent under his Great Seal, "considering the usefulness and nobleness of the structure of Berwick Bridge," which had been built by his grandfather, James I., settled a revenue upon the mayor, bailiffs, and burgesses for the time being, of £100 per annum out of his Majesty's customs at Berwick, or failing Berwick, out of the customs of any other port in his kingdom of England; with the proviso, however, "that the said mayor, bailiffs, and burgesses should from time to time for ever hereafter maintain, support, and keep the bridge in good and sufficient repair, without making any addresses or pretences whatsoever to his Majesty or successors for any future repair thereof; that the whole amount of such aforesaid annuity or revenue should be applied to the support and repair of the bridge, and to no other purpose whatsoever"; and that, should any surplus income accumulate, it was to be invested in a bank, and employed wholly on repair of future breaches or casualties that might befall the bridge.

As security for the due performance of the contract the Corporation granted to the Crown a mortgage of the manor of Tweedmouth and Spittal, which the Corporation had previously purchased from the Earl of Suffolk. The yearly grant of £100 was duly paid out of the customs till 1700, when William III., by letters patent, ordered that it should be paid out of the Imperial Exchequer. The Corporation has kept the bridge in repair; but in recent years there have been many complaints with regard to its unsuitability for modern traffic. Proposals have been made to widen it, and suggestions have also been made as to the desirability of building a new bridge altogether. There is little likelihood however, of a Government in these days being so complaisant as James I. and Charles II., and as the citizens of Berwick, while anxious to have a better bridge, are reluctant to pay the bills themselves, very little practical progress has been made, although the matter has been discussed times without number. The bridge itself is remarkable in some respects, one peculiarity being that no two arches of it are exactly alike. At one time there was a gate in the middle of it, but this has long since

been removed. Naturally, the bridge has many interesting historical associations.

ALTHOUGH Gloucester was at one time famous as a bell-founding city, and has for many years been able to hold its own in the matter of campanology, it has never been able to boast of a peal of ten bells in one tower until the present time. The eight bells at St. Michael's Church have recently been increased to ten by the gift by the Corporation of an old fire-bell, formerly hung at the Tolsey, and by the generosity of the Mayor, who presented the church with a new bell. Since the demolition of the Tolsey, on the site of which stands the Wilts and Dorset Bank, the fire-bell remained in unmerited seclusion at the Guildhall until the excellent suggestion was made that it should be returned to its original and proper habitation.

ARRANGEMENTS have been made for the fixing of a number of powerful electric arc lamps in the forecourt and stable yard at Marlborough House, which are at present very indifferently lighted. The recent placing of electric lamps in Pall Mall has somewhat improved matters, but on occasions of late State ceremonies, such as the State concerts and balls, the absence of good light has caused much inconvenience. Twice within a few months there have been mishaps with the heavy dress carriages used on such occasions, and these may be attributed in part, if not wholly, to inefficient light at awkward turnings.

THE National Gallery, already rich in Rembrandts, has acquired two more portraits by the master. They are seated figures, life-size, and three-quarters length. The first represents a man of mature age, but still in the full vigour of life, with strongly marked and handsome features, and a full beard. He wears a cap with a white band, and a loose brown robe trimmed with fur, over a light under-dress. The picture was formerly supposed to be a likeness of Yan Lutma, a goldsmith of Antwerp.

THE second is a portrait of an elderly lady with sunken cheeks and eyes, and other strongly marked features. She faces the spectator, the head being in full front view. She wears a black dress trimmed with brown fur, a black coif of tissue expanded upon wire, a large white ruff, and white wrist-bands. The hands, one of which holds a white kerchief, rest upon her chair. Both portraits illustrate an advanced stage of Rembrandt's art, his firmest method, and freest touches. They come from Livermore Park, Bury St. Edmunds.

A MEMORIAL to perpetuate the memory of Caedmon, England's first Christian poet, in the form of a cross, is to be unveiled by the Poet Laureate on September 21, at Whitby. The cross, which will stand 20ft. from the ground, has been modelled after the general shape and proportion of the four great Anglian crosses that were erected in Caedmon's time, and which are wholly or in part extant to-day. The whole cross shaft, which weighs close on three tons, is richly carved with emblem and symbol on all four sides, and the famous nine lines of Caedmon's "Song of Creation"—preserved in the Moore Baeda at Cambridge—are given upon the cross in English, in Rune, and in Saxon minuscule.

THE vestry of Chelsea is at present making a much-needed improvement on the river embankment between Beaufort Street and Milman's Street, Cheyne Walk. The high sides of last November damaged the river wall seriously that it became necessary to repair it. The opportunity was considered suitable for widening the roadway, the narrowness of which at this point has caused a large number of accidents. With the consent of the Thames Conservancy, the Vestry has arranged to set back the wall such a distance into the river as will increase the width of Cheyne Walk at the end of the present embankment to 25ft., the increased width narrowing gradually westwards to 6ft. by Messrs. Lee and Jerdein's

wharf. It is a great pity that at the same time that unsightly obstruction, the coal-storing shed belonging to that firm, could not be removed from the Embankment. The estimated cost of the vestry's improvement is £2000.

THE river is very beautiful at this point. Just a little above is Turner's old house, which has recently been restored by Mr. C. Ashbee. The improvement alluded to is right in front of Lindsey House, one of Chelsea's many celebrated old houses; it is now known as Lindsey Row, having been cut up into several "tenements," as Beaver calls them. The third Earl of Lindsey lived here in the reign of Charles II., when the house was a mansion of the greatest pretensions. In 1750 it was renovated by Count Zinzendorf, and chiefly used as a pilgrim house by Moravians in London.

THE Liverpool Artists' Club entertained at supper yesterday week the Hanging Committee of the forthcoming Autumn Exhibition under municipal auspices in the Walker Art Gallery. Mr. John Finnie presided over a large company. In responding for the toast of "Our Guests," Mr. H. W. B. Davis, R.A., said he could safely predict that this year's exhibition would be of exceptional merit, and one point was the varied character of the works apart from their high standard of quality. There was hardly a phase or a mood of art that was not represented by works of very high excellence. It was the very variety of art that lent freshness to the interest they took in art. He could not conclude without reference to the very fine collection of water-colours, for which the exhibition was largely indebted to local artists. In proposing "Success to the Autumn Exhibition," Mr. Cohen said that since 1877 the net profit of those exhibitions amounted to £35,000.

SWINDON STATION is about to be rebuilt. That well-remembered junction, where all trains stopped "ten minutes for refreshments" under contract between the refreshment contractors and the Great Western Railway Company, until the railway directors bought the contractors out at a cost of some ninety thousand pounds a few years ago, is now in a somewhat dilapidated condition. Soon after the Company took over the refreshment rooms they were burned out, and so they have remained since, a roofless wreck. The platforms will be rebuilt rather more to the eastward than now. The new station will not be on a very large scale, since the fast trains between London and the West of England simply run through, and passenger traffic to and from Swindon is not very extensive, the place only bulking largely as being the headquarters of the locomotive, carriage building, and general engineering works of the Great Western.

THERE is thought to be some probability that the house of the late Lord Leighton, in Holland Park Road, will pass into the control of the Kensington Vestry, and be preserved as a permanent Art centre. The special committee appointed by the local authority consider that it might easily form the centre of a school of Art in the widest sense. Students of form and composition would have at their hands the work and methods of Lord Leighton for their careful examination, and the large studio might be used for Art lectures, musical performances, or dramatic studies.

A COMPETITIVE exhibition of metal work is to be held in Ironmonger's Hall, on October 26 and 27, under the auspices of the Worshipful Company of Founders. The competitions will be restricted to British subjects who are founders, designers, craftsmen, or apprentices engaged in foundry business within the City of London and the area of the Metropolitan Police. Prizes to the aggregate value of upwards of £100 will be offered for various subjects, and in addition to the money awards all the successful competitors will be presented with the freedom of the Founders' Company. The exhibition will be under the direction of a

committee consisting of the Master (Mr. Wm. Edward Chambers), the Wardens (Mr. M. B. Herbert and Mr. Deputy Bertram), Professor Aitchison, R.A. (President of the Royal Institute of British Architects), Mr. Alfred Gilbert R.A., Mr. Geo. J. Frampton, A.R.A., Mr. J. Willis Dixon, F.R.G.S., and Mr. R. H. Young.

THE growing town of Rushden, in Northamptonshire, furnishes a very amusing story. When the Independent Wesleyan Chapel was erected in the year 1873, the usual custom of depositing some current coins of the realm, the deeds of the chapel, and the local newspaper at the stone-laying was duly observed. Since then Rushden has grown so fast, and the congregation has increased as to make it necessary to build a new tabernacle, and the old chapel was razed to the ground. Accordingly several "elders" of the church assembled at the demolished building to remove the treasures placed in the stonework a quarter of a century ago, but when the piece of slate with which the cavity was covered was raised with all due solemnity it was found to be empty. Some writing on the piece of slate, however, afforded an explanation of the fruitless search. Scratched on one side—evidently with a nail—was the following sentence: "Oakes to the four foundation stones. We had no beer, and that made all of us feel very queer." On the reverse side of the slate was the date, 1873, and the signatures of five men who were presumably engaged in the erection of the chapel.

AT the forthcoming meeting of the American Association for the Advancement of Science—the transatlantic equivalent of our British Association—which is to open at Boston on the 22nd inst., a notable contribution is to be made by Mr. Marshall H. Saville, who will relate the result of his recent explorations among the ancient cities of Mexico. These results are said to be the most remarkable ever made in America, and "are not only likely to revolutionise some of the pet theories of archaeologists and anthropologists, but they are of great interest for the light they throw on the question of the origin of the most ancient inhabitants of the western continent." The discoveries were made at Xoxo, some five miles south of the district Oaxaca, where, in part by accident, Mr. Saville came upon the ruins of a pre-historic metropolis, the ancient capital of the Zepotecas, the most advanced nation which inhabited the American continent before its civilisation by Europe. From the investigations which have been made of this city, as well as from the hieroglyphics which have been unearthed, a very high opinion has been formed of the culture and civilisation of the people, who are placed by Mr. Saville with the ancient races of India, Chaldaea, and Egypt, and may even prove that the early inhabitants of the country were closely related to India.

THE great discovery, however, was a huge temple at the top of a steep mountain, surrounded by an imposing peristyle, that will recall the sacrificial temple to readers of Mr. Rider Haggard's "Montezuma's Daughter." It was discovered by following what looked like a terracotta drain pipe, leading from one of the mounds into the fields. The sides of the mountain, on the summit of which stood the city and temple, were artificially terraced, and the top had been fortified on all sides until it was impregnable. On the mountain were "the crumbling ruins of amphitheatres, palaces, and other public buildings. Streets and pathways were exactly as they had been during the long centuries since their desertion. Here, on this terraced mountain, overlooking a great stretch of country at its foot, was at last found the lost capital of the Zepotecan nation." Zichila is, in Mr. Saville's opinion, the ancient name of the city, for a village exists in the neighbourhood which is known by that title. The city, according to the explorer, was one of considerable size, extending over several square miles, and he inclines to the opinion that it was probably destroyed by an earthquake. One of the largest ruins was at the southern end of the city, where a mound 1000ft. long

and 300ft. wide was discovered. The slopes of its sides were regular and faced with masonry, and a stairway led to its summit, which Mr. Saville thinks may have been the site of a large temple, or of a series of public buildings. Another rectangular mound of similar kind, which was once an amphitheatre for public meetings, was also found at the other end of the city.

MR. ALFRED SCHULZ-CURTIS has for many years cherished the idea of having a theatre erected in England after the Bayreuth plan, where model performances of the best works of art (not necessarily limited to Wagner) may be given, and, being encouraged by some influential clients, he thinks that the time has come to take a step in advance towards the realisation of this scheme. The ideal site for a theatre of this description has always appeared to him to be Richmond Hill, with Richmond Park as a background and the Thames Valley spreading beneath. An amount of from £50,000 to £100,000 may be required to carry out the suggested plan.

THE suggestion that a room should be set apart at the National Gallery as a permanent memorial of the late Sir Edward Burne-Jones is viewed very favourably by an important section of the art world. It is felt that a collection of his works, which could be acquired gradually and placed at some recognised art centre, would form a memorial at once most fitting and most acceptable to the relatives of the great artist. Of such art centres the National Gallery is the most appropriate, most dignified, and most accessible. But if this should be found impracticable, it is urged that the scheme might at least be carried out at the Tate Gallery. The memorial committee might arrange with the Tate trustees for the erection of a special Burne-Jones room in connection with the buildings now being put up on the north side. So far as is known, there are very few of the paintings by the great artist in the market at present, and the holders of some of the most valuable are known to set great store by them. There are, however, some at once to be had, and the preparation of a home for the others would probably lead to their acquisition.

THE visitor to London this year, especially if he be interested in literary associations, may chance to notice the rehabilitation of Russell Square. Although the Duke of Bedford assented to the pulling down of one-half of the east side, upon which a magnificent hotel is fast nearing completion, he has insisted on preserving the general characteristics of the Square. As leases fall in, the houses are being renovated on the old lines, save that a new story is added, and that in the external decorations there is a judicious use of terra-cotta mouldings. Thus, if the Osbornes and Sedleys of "Vanity Fair" could return to their old surroundings, they would not find the place greatly changed. The new hotel is being built in a style which will offer no startling contrast with the fine old houses around, although the characteristic of the building is the extensive use of terra-cotta frontages. When the hotel is complete and the houses are all restored, the square will again be among the most dignified and imposing of places of its kind in London.

It is quite possible that the wonderful Deepdene collection of Dutch and Flemish pictures may be exhibited in London before being finally scattered. It was got together by the ancestors of Mr. Henry Hope, and has just been purchased by Mr. Asher Wertheimer for £121,550, a price which represents a fine bargain for the buyer. Mr. Wertheimer's own portrait has hung on the Academy walls through the summer—an example of Mr. Sargent's amazing cleverness, as well as his fearsome habit of carrying truthfulness to the verge of caricature.

THE historic church of Pyecombe was reopened, after re-toration, last week. The church of Pyecombe is of great antiquity: indeed its history is lost in the distant past.

It is of very considerable interest archaeologically. While the restoration has greatly improved its exterior aspect, the interior has been made dignified and impressive. In a village like Pyecombe, so near to Brighton, and yet so isolated in its own picturesque environment amid the hills, changes come slowly; but the modern spirit is breathed in the present restoration.

THE general outlines of the old building have not in any way been interfered with, the restoration having been carried out with reverent care and regard for pious and historic associations. Several ancient monuments, including what appears to be a Maltese cross in stone, and a larger incised cross of perhaps even greater antiquity, have been discovered during excavations, and these have been carefully preserved.

THERE is a double piscina in the sanctuary; it is, therefore, probable that in pre-Reformation days there were two altars in the church. In addition to the Norman work there are distinct traces of Saxon work to be found in the sacred building. The triple arch dividing the nave from the chancel, and which has been very carefully restored, is a curiously interesting feature, and the quaintly ornamented leaden font, dating, it is believed, from the twelfth century, is also of much interest, as there are very few leaden fonts to be found in England, and only two, it is understood, in the county of Sussex. The improvements which have been carried out include the re-roofing of a portion of the tower and nave, and the enlargement of the vestry, which formerly was almost amusingly small; the belfry has been restored, and windows put in throughout with fresh iron, lead, glass, and stonework; the interior walls have been painted, in places, where needed, with petrifying damp-proof solution; a new brick drain has been put round the exterior of the building, and the mounds of earth removed, there having been a huge mound to the west side of the tower; the heating apparatus is entirely new, the seating has also been improved, the tower has been strengthened with new beams—this being a considerable work in itself, and absolutely necessary, as the tower was getting into a dangerous state; the porch has been renovated and a new door supplied to it, the old inner door of oak studded with big nails having been retained; a new system of lighting has been introduced by means of hanging lamps of an ecclesiastical pattern; new choir stalls of oak have been provided, and the fine curved oak reredos is new.

A FINE statue of An-Kheft Ka, which was found at Dashisheh by Dr. Petrie, and a miniature false door from the door of the Priest of Memphis, from Sakhara, have just been acquired by the Oriental Department of the British Museum. Both works are supposed to have been in existence about B.C. 3400, and, therefore, belong to the time of the fourth and fifth dynasties. A number of early Babylonian inscriptions have also been purchased by the Museum authorities. Some of these documents relate to temple accounts, are beautifully written, bear the date of 2800 B.C., and evidently belong to the cities of South Chaldea.

THE rumours that the beautiful Ken Wood, abutting Parliament Hill and Hampstead Heath, is to be covered with bricks and mortar are without foundation. Earl Mansfield writes from Scone Palace, Perth, that it is not his intention to place the estate in the market, but that he intends to make the place his summer residence. With this object in view, the interesting old mansion is at once to be put into a thorough state of repair.

THE annual excursion in connection with the Penzance Natural History and Antiquarian Society took place on Friday week. The route taken was by Alverton, Toltoft Hill, Tremathic Cross, and Tollgate, across Skymiel Bridge, past Deadman's Grave and Trannack to Grumbla. Here the party paid a visit to the last of the round houses, built of clay, and

then walked across the country to Botrea Hill, where a barrow was opened by the Society, under the president's directions on August Bank-holiday. It was unfortunate that the president, Mr. J. B. Cornish, was unable to accompany the party, and the excavations were explained by Mr. F. Holman. Nothing was found in the cross-cuts beyond evidences of burnt wood and charred soil, but not such wood as was found at Chysauster last year, which was evidently the remains of furze branches. The presence of some stones in the barrow, which have been thrown in promiscuously, rather point to the fact that the barrow had been opened previously, but if it has not been thoroughly disturbed the Society have hopes of yet making a good discovery. From Botrea the party drove to Chapel Corn Brea, where the remains of the old chapel on the summit of the hill were visited, and the cars rejoined at Preena Smithy, and Sennen ultimately reached. The church was inspected, the Rector explaining the many interesting features of the edifice, which dates from 1441, according to the inscription on the font. St. Sennen was supposed to be an Irish saint, who came over to Cornwall at the close of the fifth or early in the sixth century, but there is no reliable information on this subject. The church possesses a sweet peal of five bells.

THE works of the Paris Exhibition are being carried out with much activity and extraordinary care and method. According to custom, exhibitions are never finished at the time of opening, and the last exhibition was no exception to the rule. On this occasion the directors have decided to break the tradition, and have resolved that everything shall be absolutely ready on May 1st, 1900. This may be possible as far as the buildings are concerned, but will it be possible to compel the various exhibitors to be in their places and have their products in order by that date? There will be so many thousands of them, and, coming from so many parts of the globe as they do, it will be difficult to look after every one of them. This, however, is of secondary importance. The great thing is that everything concerning the construction shall be finished before the great day.

WE understand that the authorities at the British Museum have in preparation a most interesting compilation dealing with the older relics which have been received from time to time from West Africa in the department of British and Mediæval antiquities and Ethnography. Among the recent additions to the collection, which will be specially dealt with, are the remarkable series of bronze plaques which were sent from Benin to Downing Street some time back by Sir Ralph Moor, the Commissioner and Consul-General for the Niger Coast Protectorate. Experts who have examined these curious objects, which were produced by what is known as *cire perdue* process, fix their date at about 1560, and all agree as to the perfection of the workmanship of which they give evidence. Many of these plaques have found their way into London auction rooms, a few may be seen in the museum of the Royal United Service Institution, but the large majority were consigned to the Foreign and Colonial Offices.

THE latest innovation is a tramway through a cathedral. Strange to say, the idea does not hail from the States, that home of *fin-de-siècle* notions, but from Utrecht, where the faithful have been much scandalised by the intrusion. The cathedral in question was built in the thirteenth century on the site of an older one founded by St. Willebrodus, Bishop of Utrecht. In 1674, after a terrible storm, a portion of the nave gave way, leaving a large space between the chancel and the tower. The tower is a beautiful piece of architecture, and is 350ft. high. A new nave has been built, but it does not stretch as far as the tower, and there is still a fairly wide street between the two, which is considered as consecrated ground. Hence the disgust of the congregation when the municipality of Utrecht established tramway lines there.

A GREAT ASYLUM SCHEME.

PROPOSED BUILDINGS AT WEST BANGOUR.

MR. HIPPOLYTE J. BLANC, R.S.A., who has been appointed architect for the new asylum at West Bangour, visited many asylum buildings in the course of maturing his scheme, among others Alt Scherbitz, near Leipsic; Dalldorf, Claybury, Hawkhead, Hortwood, Gartloch, and Murthly, Perthshire. From these institutions facts were ascertained upon the result of the working of the latest improvements in each, both in arrangement of parts and as regards appliances. The characteristic aimed at by the architect in the outward treatment of the designs is variety of expression, consistent with the internal requirements. In some instances a little more architectural style has been infused into the design, to relieve the eye as far as possible from any sense of uniformity or monotony. Having regard to the conditions of site, the position chosen on the plan for the main entrance is suggested as that affording the largest area of a uniform surface, and it is therefore most convenient for receiving and delivering all heavy goods for the colony.

THE ADMINISTRATIVE BLOCK

is placed in the middle of the medical and hospital blocks, conveniently near the localities to be served. The porter's house is placed at the back, with separate access and staircase, but with through communication to the main building. The plans of the kitchen block provide for the requirements, and show all requisite fittings and apparatus. These are of the very latest construction, and have been found to work admirably in other modern asylums where they were seen. Bedroom accommodation for cook and assistants is also provided within the block. The stores block and the kitchen block are attached, and have through private communication. An abundance of lighting is afforded by means of continuous cupolas of clerestory side-sashes, with opening frames for ventilation, under simple and easy control. By this mode of construction the heating effect produced by ordinary roof-lying lights is destroyed. The church is designed to meet the requirements of Presbyterian or Ritual service as may be desired.

THE RECREATION HALL

is placed almost in the centre of the whole site. The floor area is unobstructed by pillars, and ample provision is made for stage and dressing-room requirements. At the main entrance are two cloak rooms, and for an increase of accommodation a gallery can easily be constructed over the recess between the two vestibules to hold 130 persons. There are four doors of access, any two of which can be for males, and two for females if desired. In treating the exterior of the hall, one of the vestibules has been designed to carry a lofty tower. In that tower it is proposed to place tanks of 30,000 gallon capacity, wherein water may be stored for the general service of the several blocks or for the wash-house, and also as a supply for fire hydrants. Above these is

A CLOCK CHAMBER,

placed at such elevation as will conveniently be viewed from any part of the colony. The hall is prominent, and, consistently with the idea of giving special consideration to prominent parts, it is more decoratively treated than some other buildings. The bath-house is lighted from clerestory windows placed high. In other asylums it is recommended to have screens between each bath, and so the plan provides for screens of moderate height and rejection. Each bath spills into a continuous gutter in the floor, and so all complication of timber work is overcome. The baths are proposed to be of fireclay, glazed white inside and outside, placed upon moulded blocks raised on the floor. The mortuary block is planned on the lines of the best equipped mortuary in Scotland. A special addition shown upon the plans is a duplicate mortuary for the sexes, a dissecting room, and a refrigerator. The situation of the mortuary has been specially considered. It is comparatively near the

hospital, and from it bodies may be removed outside the precincts of the colony without observation by any inmates. The laundry block is quite close to the kitchen and store block. The fittings proposed are selected from the best of those found in use in good modern asylums. As in other blocks named, the natural lighting here is by continuous upright glazed cupolas, and the means for ventilation are of the simplest and most efficient construction—namely, opening frames by means of cords and pulleys. The boiler and engine-house block immediately adjoins the store block. The accommodation provided is considered ample for the colony. The steam heating for kitchen, &c., may be served by one or two boilers. One is required for the electric lighting, and one—a spare one—for emergencies. The boilers are of necessity placed at a lower level than the ground, and the coal store adjoining, capable of housing 400 tons, is also placed at the same level, because the coal would thereby be more easily delivered to the cellars. The dynamo room is purposely delineated of ample space to admit of an increase in the number of dynamos, and also to afford space for storage batteries, which may be found useful. The equipment can quite readily be limited to the requirements of 720 persons in the meantime. The bakery is designed to meet the requirements of 1200 people. It is planned upon the best modern models.

THE WORKSHOP BLOCK

is, for obvious reasons, attached to the engine-room block. It is virtually more than a block, forming in its complete condition three sides of a courtyard. The nurses' house, for obvious reasons, is placed at the extreme west end of the site, being at a convenient distance from the medical section. The strain of their special duties demands perfect quietness in their retreat. In the plan the effort has been to group the accommodation prescribed in the most economical and convenient manner, and yet to give a certain degree of individuality to the whole block. Special accommodation for a matron is also provided. The medical superintendent's house is placed where it can be readily accessible to visitors and inquirers—namely, within ready view and easy reach of the main entrance. The attendants' cottages are planned for varying accommodation of three and four apartments. Those of three apartments have no separate bathroom, while those of four apartments have. The series is designed

WITH A VIEW TO PICTURESQUENESS,

without unnecessary ornamentation, but with sufficient form to give them architectural interest. The infirmary and sick-room blocks complete the group fronting the high land on which the medical section is placed. The situation is selected for its comparative airiness, as well as the other advantages of convenience. The hospital block is arranged that one side or half is a counterpart of the other. The kitchen is arranged in the middle. A doctor's room is also provided. A feature of the plan is that at the ends of the wards are two single rooms, one of which is for a moribund patient, who, after death, can be removed by the outside door of the room without having to be conveyed through the ward. The arrangement has received careful consideration to secure separation of sexes, and easy communication throughout upon an economical form of construction. The asylum houses are arranged to supply the accommodation required, and variety is sought to be gained by varying the areas and consequent accommodation of dormitories in the several blocks. For the industrial or non-medical section ten separate

SCHEMES FOR VILLAS

are submitted—five for men and five for women. The aggregate number of 150 of each sex has been divided as follows:—One villa of twenty-five, one of twenty-six, one of twenty-eight, one of thirty-two, and one of forty patients. Fire hydrants and hose chambers are provided for in every block at convenient places in the corridors or in staircases. No special fireproof construction is contemplated. There is com-

parative immunity from fire risks by the isolation of the different blocks. The ventilation of the various dormitories and day-rooms is provided for by means of fresh-air inlets in the window recesses at the floor levels, under key control of the attendants. Radiators are proposed to be placed in the window recesses, so that in winter the incoming air would be warmed, while in summer the air would be admitted by the same openings in a natural state. For the release of vitiated air grated openings are proposed to be placed in the walls near the ceilings, and led in specially-constructed glazed brick flues into an outlet shaft and ventilator in the roof. A fan in the ventilating shaft driven at any time when required by an electric motor is much more satisfactory. All windows are intended to open, but by means of a small brass bracket permanently screwed to the case the extent of the opening is limited to about 7in., which is quite serviceable for all requirements. The cost of the building to accommodate 1000 patients is set down at £235,000.

A BEAUTIFUL MODERN CHURCH.

ONE of the most beautiful of modern churches near London is St. John the Evangelist's, on the Auckland Hill of Upper Norwood. Occupying as it does a commanding position near the Crystal Palace, it can be seen for miles around, and is as conspicuous a feature of the landscape of South London as Harrow Parish Church is of the north. It is a sister church to St. Augustine's, Kilburn, and it is curious to note how Mr. Pearson, the architect of both, has tried experimentally in either one or the other various devices which, if successful, he definitely adopted in each. The style of Architecture is Early English of the

PUREST AND SEVEREST TYPE,

a style which, however, lends itself to a vast amount of enrichment in details and furniture. Those who have worshipped within the walls of St. John's have amply availed themselves of this, and the whole building has been well described as a "cluster of thank-offerings," the greater number of these being anonymous. With its fittings the church has cost considerably more than £30,000, while during the incumbency of the present, who is also the first, vicar (a period extending to nearly twenty-four years), £100,000 have been gathered in for different purposes connected with the church. The interior of the building is most impressive, while the roof is vaulted, the ribs of the groining being of stone and the cells of brick. There is yet an appearance of lightness about it, which is intensified when one remembers the fact that there are no flying buttresses against the outside walls of the church. Dividing the nave from the chancel is a fine stone screen, the carvings of which have cost some £600, and is one of the anonymous "thank-offerings." The figures with which it is embellished represent the saints and doctors of the Church, and the whole makes up

AN EPILOGUE OF EARLY ECCLESIASTICAL HISTORY.

Crowning the whole are large statues of the four Evangelists. Above the screen hangs a huge gilt cross, the gift of the Guild of St. John. The reredos is probably unique in that it is the gift, design, and actual work of a lady who is an associate of the Guild. It is divided into thirteen stone panels, the centre being occupied by the "Crucifixion," with the Virgin mother and St. John on either side. The figure on the cross is not conventional, and the face is represented as gazing upwards. The altar is of cedar wood, and is enriched with much carving. On the south of the chancel is the side chapel, which is entirely of white stone, and is quietly beautiful. Here again the Guild of St. John has been at work, and the altar, which has three silver sanctuary lamps hanging before it, has been painted by one of its members. The reredos in the chapel takes the form of a triptych. The windows of this chapel are yet another anonymous offering, as are also many of the other specimens—mostly by Clayton or Kempe—of stained glass in the church.

Professional Items.

BLYTH.—A new Masonic Hall has been erected at Blyth. The building is an imposing structure, the front being ornamented with Masonic emblems. It is built of red pressed bricks, with terra-cotta facings. The large bay windows have camber arches, and are also ornamented with terra-cotta. The passage and hall are beautifully tiled. On the basement there are two rooms on each side of a heavily panelled entrance door, with smoke and club rooms in the rear. The lodge room is upstairs, and has two ante-rooms attached at the west side, being in all respects a most commodious meeting place. There is also a caretaker's house attached to the building. The whole range of the premises is heated by means of hot water pipes, and ventilated by Boyle's patent ventilators. The contractors for the building were Messrs. Jno. Goulding and Sons, Blyth; the plumbing has been done by Mr. Thomas Poulter, Blyth; the painting by Messrs. Ternent and Nicholson, and the furnishings have been supplied by Mr. Jno. Mount, Cowpen Quay.

BURLEIGH.—A new building for the Birmingham District and Counties Banking Company Limited has been opened for business. The bank is situated in Moorland Road, at the corner of Price Street. The two fronts are faced with Ruabon bricks, and have dressings of red and buff terra-cotta. The bank entrance is at the corner of the two streets; the doorway is richer than the other parts of the exterior, and is executed in red terra-cotta. There is a side entrance from Price Street, and another doorway in Moorland Road, the latter giving access to a set of offices on the upper floor. The banking-room is 30ft. in width, by 34ft. in length, and 17ft. 6in. in height. It has a dado all round of encaustic tiles, which, with the pavement of the public space, is the work of Messrs. T. and R. Boote, Limited. The builders are Messrs. C. and J. Grant, of Cobridge. The architects are Messrs. C. Whitwell and Son, of Birmingham.

CARDIFF.—The Great Western Railway Company has at last set in hand the work of erecting a new station on its line to serve the Roath and Splott end of the borough. The new station when completed will be found to be an extremely well-arranged place. Whilst the permanent officials at Paddington have prepared the plans, &c., work will be in the hands of a Cardiff firm—Messrs. Mackay and Davies—and Mr. J. C. Lloyd, resident engineer, will superintend the erection. The entrance will be from Pearl Street, where the booking office and parcel office will be erected in a separate building, which is connected with the up platform by a partially covered way. Upon the platforms, which will run 500ft. long, there will be the usual waiting-rooms and other accommodation for passengers, and a partially covered footbridge will connect the two platforms. The old Splott Road Bridge is to be rebuilt, and when this is carried out the bridge will be about 120ft. long and 75ft. wide. The contract price for the work is £15,000. The completion of the new Custom House in course of erection in Bute Street, near the Pier Head, Cardiff, will be reached about the end of September. The building, which is being erected at a cost of about £4800 by the firm of contractors, Messrs. W. Thomas and Co., of Cardiff, from the design of Mr. Tanner, architect of H.M. Office of Works, London, occupies a central and convenient situation in the heart of the business part of the Docks. It is a mixed style of classic architecture and three stories high, the front which faces Bute Street being in Portland stone, effectively relieved with carvings by Mr. Clarke, of Llandaff, while the side and rear are in white brick, partly relieved with Portland stone dressings. The entrance is from Bute Street, by means of a forecourt at the side nearest the Pier Head.

DEAL.—The South Eastern Hotel, which has been erected at Deal for the South Eastern Railway Company, has just been opened. The hotel is situated on the sea front next to Deal Castle. The hotel is a conspicuous object on the sea front. It has been built in accordance with modern ideas, and is handsomely appointed; there are lifts to all floors, and the lighting is by electricity from a private installation.

DRUMMUIR, BANFFSHIRE.—Certain alterations and extensions are about to be made on Drummuir Castle. The proposed alterations will give greater height to the west wall and to the rooms adjacent. To preserve the continuity in the external appearance of the walls, the building stones have been taken from the quarry which supplied the material half a century ago.

DUNDEE.—The erection of a new church is projected by the St. Paul's Episcopal Church, Dundee. The building is to be carried out in a combination of red brick and stone, with green slates. The architect is Mr. T. M. Cappon, Dundee.

FINGLAS.—At St. Margaret's, Finglas, the Archbishop of Dublin laid the foundation stone of a new church. The church, of which Mr. G. L. O'Connor, M.R.I.A., is the architect, is Early English Gothic in character, the nave is to be 80ft. long by 32ft. wide, with chancel, sacristies, &c., and is capable of accommodating four hundred persons. The walls will be built of limestone masonry, lined throughout with brick, strengthened by buttresses. The roof is of open timber, constructed with curved ribs, moulded principals, &c. A handsome porch will form the principal entrance at the west side of the church facing the roadway. A neat cut stone base and ornamental railings will encircle the ground.

GLASGOW.—A large new public school for the Finnieston quarter of Glasgow has just been opened. The new school has frontages to Stobcross Street, Elliot Street, and Port Street, and with large playgrounds, has opened up and greatly improved the district. The schoolrooms are on three floors, with a basement in which are placed large drill and play halls. The school will accommodate 1220 children, fully one-third of whom will be in infant classes, which occupy the whole of the ground floor. The architects employed were Messrs. H. and D. Barclay, who have had long experience in this class of work. The contractors are: For mason work, Mr. John B. McCallum; wright work, Mr. Alex. Ferguson; plumber, Robert Bowie; slater, A. and D. MacKay; iron and steel, P. and W. Macellan; paving and concrete floors, A. M. Ross and Sons; plasterer, H. S. Bathgate; heating, Hunter, McWilliam and Co.; ironmongery, Highet and Roxburgh; gasfitting, Mr. Pauling and Messrs. Stott; stair railing, William Lightbody; painter, John Watson; iron railings and gates, John Munday.

GOBOWEN.—The foundation stone of a new Vicarage for the parish of Hengoed and Gobowen, has been laid. The plans for the house, which is on the main road on the Oswestry side of Gobowen, were prepared by Messrs. Shaylor and Madoc Jones, architects, Oswestry, and the contractor is Mr. W. Felton, Oswestry. The plans, which were selected by the architect of Queen Anne's Bounty office from various plans sent in, are for a building of ample dimensions, and the external appearance will be a picturesque treatment of red brick, brown tiles and white woodwork. The cost of the building is estimated at £1500.

LEEDS.—The Cookridge Street Baths Subcommittee of the Leeds City Council has had under consideration the alterations which it is proposed to carry out at the Cookridge Street Baths, recently acquired by the Corporation, and which it is expected will cost about £5000. The Committee intend to make the gentleman's first-class bath at Cookridge Street Baths shallower, and to turn it into a ladies' bath. The large swimming bath at Cookridge

Street, which has not been used for some time, will be altered and made into a first-class gentleman's swimming bath. Its length will be shortened to 75ft.

LIVERPOOL.—St. Polycarp's School, Everton, has been reopened after extensive alterations and enlargements. The boys' school has been subdivided by means of Wilks' Climax sliding partitions, new apparatus for heating and ventilating has been supplied, and a fresh roof constructed. The accommodation has been raised to 1000 places. Mr. T. Taliesin Rees, A.R.I.B.A., 32, Hamilton Street, Birkenhead, was the architect, and Messrs. Dargue, Griffiths and Co. Limited, of Lord Street, Liverpool, were the contractors.

LUSK.—A new high altar and two side altars have been erected in the Church of St. Maccuillin, Lusk. The design and execution of the work in connection with the high altar was entrusted to Messrs. Early. The design of the high altar is elaborate, and great taste is shown both in its planning and execution. The painting of the sanctuary is exquisitely done.

MAIDSTONE.—The work of restoring and enlarging the little parish church of Allington, near Maidstone, is now in progress, Messrs. Fryer and Co. being the contractors. A transept is being added, and needed alterations are being carried out. Mr. Godfrey Gray, ecclesiastical artist of Cambridge, has begun the work of decorating the walls, &c. To him has also been intrusted the designing and painting of a carved triptych to surmount the altar, together with the treatment of the five new lancet windows for the nave and transepts. Among the special gifts promised are a stained-glass window for the west end, a font cover, and two five-light standards in iron and brass for the sanctuary.

NEWLAND.—A new bridge has been opened at Newland. The old structure was an arch bridge, built a great number of years ago, and during the course of time the level of the road on each side has gone down, with the result that the bridge formed a nasty rise in the surface. The bridge is constructed of steel girders, resting upon abutments of red sandstone, from Hawcoat Quarry, in which stone all the rest of the bridge is carried out. The girders are ten in number, of 12in. by 18in. steel, and weigh about one ton each. These are covered by road plates $\frac{1}{2}$ in. thick, and on these is a layer of 6in. of concrete, covered again by 6in. of tar macadam.

ST. HELIERS.—The Municipality have accepted the tender of the Horsfall Furnace Syndicate Ltd., for a refuse destructor, with accessories complete, for steam raising.

SHERE (Surrey).—The hall that has been erected at Shere, West Surrey, to commemorate the Queen's Diamond Jubilee, was formally opened on Friday week. The hall, built of red brick, in the Tudor style, is situated on the cricket-ground on the Netley Park estate, facing the main street. The estimated cost of the hall, with the furniture and fittings, is £1200. It has been built to the designs of Mr. Felix Clay, and Mr. Etherington, of Albury, was the contractor.

WORKSOP.—The scheme for the erection of a cottage hospital at Worksop has now taken definite shape. It has been decided to erect the hospital on the Watson Road site, and the plans have been approved. Tenders have recently been received for the erection of the buildings, and that of Mr. W. E. Shaw, of Ilkeston, at £3050, has been accepted. The committee have deemed it advisable not to complete the whole scheme at present, but to leave the completion of one ward, the operating room, and one sanitary block, to be added as soon as means warrant. Building operations will shortly be commenced, in accordance with the plans drawn by Messrs. Flockton, Gibbs, and Flockton, of Sheffield and Worksop.

Correspondence.

CRUCIFORM CHURCHES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Your correspondent "E. R.," in his article on "Cruciform Churches," in your last number, says that he "ventures to hope that a little information" on this subject "will not be considered superfluous." But I would suggest that this information to be useful should be correct. In the list of fallen towers given (copied from Mr. Bishop's book) the dates for Winchester and Worcester (first) are wrong, and should be reversed. The failure at Chichester is well known, but when did Hereford tower fall—and since 1861? This is certainly one tower where some scientific knowledge was shown in its construction. Again, as to Peterborough. The central lantern tower of fourteenth century date had no "fliche" in recent times, and Mr. Pearson rebuilt the tower stone for stone, and did not, as your correspondent suggests, build a new Norman tower. I am glad to see Mr. Bishop's book quoted. This is one of the best books on Architecture available for students, and deserves to be better known.—I am, sir,

E. J. M.

THE R.I.B.A. AND THE GOVERNMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—The editorial comment on my letter in your current issue leaves me no alternative but to reply.

I fear that in my endeavour to be concise I have only succeeded in being incoherent, as your note seems to miss my main point, and to misrepresent the general drift and purpose of my letter.

I intended to lay no "charges at the door of the R.I.B.A." beyond the one charge that they did not rise to the occasion. I did not "presume that the names were not honestly chosen," because I presumed nothing at all about it. "Mr. Jemmett does not adduce a little of proof in substantiation of his suppositions," because he supposes nothing. I took certain facts which I believed to be indisputable, applied them to different hypothetical cases, and endeavoured to deduce the only logical inferences applicable to each case. To do this may possibly be uncharitable—though the term is new to me as applied to a logical process—but it certainly is not unfair. My facts may be wrong, my reasoning false; but that is another matter. If my letter can reasonably be interpreted as presuming or supposing dishonest motives on the part of the Institute, then I have expressed myself badly, and should have done well to develop my argument further. I endeavoured to point out that if the Institute was free to select the best men, and if it selected its own members, then it did so to the prejudice of better men. As the best men are not members, and as the Institute is aware of this fact, I see no escape from this conclusion myself; but I expressed no opinion as to whether they were free or not to choose the best. If anyone from his own knowledge of what actually did occur, selects this one of my alternative propositions as fitting the case, and deduces from it the conclusion that it spells dishonesty, this is a practical application of my argument, over which I have no control.

But, sir, my object in trespassing on your space was not to attack the Institute or to make general reflections on its character or intelligence. This subject in itself is not of overpowering interest or importance to anyone but its own members. I wished to place on record my protest against the arrangements for the erection of the new Government offices; to point out that the method whereby the architects were chosen was one hardly calculated to obtain the best men; and to deplore the fact that the Institute did not rise to the occasion when appealed to by the Government as a representative society. For these purposes, therefore, I referred to the notorious fact that the best men are not to be found at the Institute, and incidentally I endeavoured to show the awkward position in which any such society as the Institute is placed when

appealed to in this way as representing the whole Profession, when, as a matter of fact, it does no such thing; and now, having once placed itself in a false position by accepting the compliment, every possible line of action which it may adopt becomes open to question and possible misrepresentation.

And though, sir, this is a point on which you may quite fairly differ in opinion, yet I think in my main contention I have your sympathy and that of every architect who realises what these arrangements mean—how heavy the blow that has been struck at the dignity and prestige of Architecture—and who foresees how endless the humiliations to which it opens the door. And I fancy, sir, that when you come to think this over, you will also agree with me that the Institute did lose a great opportunity when it neglected to protest with all its might, and to appeal for the support of the whole Profession, which support would have been given by none more willingly than myself.—Faithfully yours,

A. R. JEMMETT.

[We should be sorry if we thought we had misrepresented Mr. Jemmett's attitude. To our mind, he does not come down to facts sufficiently. The foundation upon which he bases his "logical deductions" and "propositions" is as insecure and shifty as sand. Mr. Jemmett evidently is tremendously impressed with the fallability of mankind when faced with temptation, for he concludes that "it can only be inferred that the Institute yielded" in the hour of trial. The meagre facts available do not justify the inference. It is just possible, we think, that the Institute, professing some little interest in Architecture, rose above personal prejudices and sought the true advancement of the Art by honestly recommending the men best qualified, in its opinion, to erect these important national buildings. We still think that Mr. Jemmett's former letter contained a clear imputation of dishonesty—on this point readers may judge for themselves, and we therefore abstain from lengthy argument—and it was our acquiescence in this imputation we disclaimed. Outside this, we are heartily in agreement with Mr. Jemmett.—Ed. B. J.]

A NEW court-house has been formally opened at Penge.

It has been decided to enlarge Dromore Cathedral. The enlargement of the cathedral is a much needed work, and in order to make the alterations at present proposed, including the introduction of suitable heating apparatus, over £1000 will be required.

THE foundation-stone and two memorial stones of a new Wesleyan Sunday School have been laid at Portishead, Bristol. The new school is being built in a style harmonising with the architecture of the chapel, and includes a large hall and two smaller rooms.

A VILLAGE hall and library has been built by the Halkin Parish Council. Halkin is the centre of the Flintshire lead-mining industry. The village hall, which combines a reading room, library, billiard room, &c., is of local stone. It was built by Mr. A. B. Lloyd, Flint, from plans prepared by Messrs. Douglas and Minshall, Chester, the architects of the Eaton estate. The total cost has been £950.

ONE of the remaining old houses in Fleet Street, situate opposite Chancery Lane, which is said to have been formerly the palace of Cardinal Wolsey, has had to be shored up in consequence of losing the support of Gosling's Bank next door, that old building having recently been pulled down. The other side of the house, abutting on Inner Temple Lane, has also been affected, and has had to be strengthened by supports.

THE annual Blue-book about the affairs of the British Museum has just been published. Among the more important acquisitions of the year we gather from its pages is a further series of Egyptian sculptures of great antiquity, supplementing those which were purchased in 1896. The most valuable addition of literary interest is a papyrus, unfortunately much mutilated, of the first century B.C., containing poems of the Greek poet Bacchylides, the contemporary of Pindar.

Enquiry Department.

CONCERNING DRAINS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly answer through your valuable journal the following questions:—There are three cottages, each belonging to three different persons, joining each other, with only one 6in. drain from the sewer to the middle house, the drain of the houses on either side running into it. Can the owner of the middle house cut off the drain on each side, thus compelling the owners of the two houses to put separate drains? Also in reference to rain-water conductor as well? The houses have been built about ten years.—Yours truly,

H. P.

The owner of the middle house may not interfere. The common drain ranks as a sewer, and belongs to and is repairable by the local authority, while the drains from the houses on either side belong to those houses respectively.

BOOKS ON ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly inform me the best books to study for the South Kensington S. and A. subject "Architecture"? and oblige.—Yours truly,

"PUPIL."

The best books are Hamblin's "Architectural History"; Sturgis's "European Architecture," and Roger Smith's "Architecture." There are, of course, many more detailed works dealing with special periods and styles, while the measuring and sketching of good old work is essential to obtain a real mastery of detail; but the above three books will serve for general reading.

Under Discussion.

ARCHÆOLOGY IN WALES.

THE fifty-second annual session of the Cambrian Archaeological Society opened at Ludlow last week, under the presidency of the Right Hon. Lord Windsor. The association last visited the historic town, situated in what was once known as the Marshes of Wales, in the year 1852. The present meeting is a joint one, the Shropshire Archaeological Society having joined forces with the Cambrian Association. Among the places of interest visited were: Stanton Lacy, Holgate, and the prehistoric remains at Abdon Burf, the site of the Battle of Mortimer's Cross, and the ruins of Wigmore Castle; and Coxwall Knoll, the debatable site of the struggle with Caractacus.

Views and Reviews.

THE ELECTRICAL ENGINEER'S CENTRAL STATION DIRECTORY.

THE second issue of this publication has just made its appearance. It is a very useful work of reference to the practical electrician, whom it provides with the latest information on the electric supply stations in the various towns where used. The work will save much time and expense in preparing reports to municipal bodies. It also deals with the Board of Trade Regulations, Electric Tramways and Railways, a List of Members of the Municipal Electrical Association, a List of Electrical Engineers, and Biographical Notices.

"The Electrical Engineer's Central Station Directory." Biggs and Son, London. 3s. 6d.

THE church bells, chancel, and clock at Axminster will be reopened by the Lord Bishop of Exeter on Thursday, Sept. 29.

THE War Department has decided not to demolish Landguard Fort, on the Suffolk coast, at the mouth of the Orwell, opposite Harwich. The fort is, however, to be reconstructed and improved, so that it will accommodate three batteries, instead of one, as at present.

TENDERS.

ASHTAD (Surrey).—For the erection of two cottages, for Miss L. Smithers, at Barnet Wood-lane. Mr. J. Keal, architect, 23, Wells-street, Oxford-street, W. — £456

CONTRACTS OPEN.**NEW PUBLIC HALL and POST OFFICE, WELLS, SOMERSET.**

TO BUILDERS AND CONTRACTORS.
The City Council hereby invite TENDERS for the ERECTION of NEW PUBLIC HALL and POST OFFICE BUILDINGS, on the site of the present Market Hall at Wells.

Plans may be seen, and bills of quantities and form of Tender obtained, at the office of the Architect, Mr. JOHN JOHNSON, A.R.I.B.A., 9, Queen Victoria-street, London, E.C., and of the City Surveyor, Wells, Somerset, on payment of a deposit of £3, which will be returned after receipt of bona-fide Tenders.

Tenders, on the form prepared, are to be sent to my office not later than FOUR o'clock on SATURDAY, SEPTEMBER 3rd, 1898.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a bond with two approved sureties for the due performance of the contract.

REGD. L. FOSTER, Town Clerk,
Town Clerk's Office, Wells, Somerset,
August 2nd, 1898.

WALTHAMSTOW SCHOOL BOARD.

TO BUILDERS.
The Walthamstow School Board invite TENDERS for the ERECTION of NEW SCHOOL BUILDINGS in Queen's-road, Walthamstow.

Plans and specification may be seen, and bills of quantities obtained, at the Office of the Architect, Mr. W. A. LONGMORE, F.R.I.B.A., 7, Great Albion-street, E., between the hours of TEN a.m. and FOUR p.m., except on Saturdays.

A £5 note must be deposited for the quantities, and another £5 note must be enclosed with Tender, both of which will be returned to those sending in bona-fide Tenders.

Tenders to be endorsed "Tender for New Schools,"

CARL HENTSCHEL & CO.*Photo-engravers,**Electrotypers,*

AND

Designers.

HEAD OFFICES:

The Reproduction and Engraving of all kinds of originals undertaken, whether line or half-tone, for Books, Magazines, Newspapers, Catalogues, &c., &c.

The Reproduction of Architectural Drawings. Wall Paper Designs of every description a Speciality.

Estimates, Price Lists, and all further information will be forwarded on application.

Telegraphic Address: "HENTSCHEL, LONDON." National Telephone, HOLBORN, 169.

and addressed to the Clerk of the School Board, Cleve-lands, High-street, Walthamstow, and delivered not later than FOUR o'clock p.m., on TUESDAY, SEPTEMBER 13th, on which day, at SEVEN p.m., they will be opened.

The Board do not bind themselves to accept the lowest or any Tender.

T. W. LIDDIARD,
School Board Offices, Clerk to the Board,
High-street, Walthamstow,
August 17th, 1898.

N.B.—Any person or firm Tendering will be required to make a declaration that they will pay all workmen employed by them on the above Work for the Board the fully recognized London rate of wages, and will observe such hours of labour as are generally accepted as fair in their trade.

BOROUGH OF BURY ST. EDMUNDS.

BUILDINGS.
The Corporation of Bury St. Edmunds are prepared to receive TENDERS for the ERECTION of BUILDINGS, CHIMNEY SHAFT, &c., for their Electric Lighting Station.

The plans and specification may be inspected at the offices of Mr. J. CAMPBELL SMITH, C.E., Borough Surveyor, and also at the offices of Mr. F. HASTINGS MEDHURST, B.Sc., M.Inst.E.E., the Consulting Engineer to the Corporation, Westminster-chambers, 13, Victoria-street, S.W., from the latter of whom the bill of quantities can be obtained on payment of a deposit of Five Guineas, which will be returned on receipt of a bona-fide Tender.

Sealed Tenders, endorsed "Buildings," must be delivered to me on or before SEPTEMBER 10th, 1898.

The Corporation do not bind themselves to accept the lowest or any Tender.

The building is contingent upon the Corporation obtaining the consent of the Local Government Board to a loan of £20,000.

C. E. SALMON,
Bury St. Edmunds, Town Clerk.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"Iowa" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING, (each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

SANITARY CONGRESS.

THE annual congress of the Royal Institute of Public Health was opened last week in the Examination Hall of Trinity College, Dublin. Sir Charles Cameron, M.D., Medical Officer of Health for Dublin, president of the Congress, was introduced to the delegates in a brief speech by Professor W. R. Smith, M.D., president of the Institute. Sir Charles Cameron then delivered the presidential address. In the course of it he said: My first duty is to express my warmest thanks to the Royal Institute of Public Health for the honour which they have conferred upon me in selecting me to preside at this important hygienic congress. It is by no means the only compliment which the Institute have paid me, for I gratefully bear in mind that four years in succession they unanimously elected me to be their president. I esteem this action of the Institute all the more from the circumstance that their headquarters are situated in London, whilst I am a resident in Dublin. I rejoice to know that under the leadership of my distinguished successors, Sir Henry Littlejohn and Professor Smith, the career of the Institute has been one of uninterrupted success, and that at this moment they occupy a high position among the many useful organizations in these countries which are supported by voluntary efforts and are without State aid. My next duty is the pleasant one of welcoming most warmly, on behalf of the reception committee of the congress—and I may indeed say on the part of the citizens of Dublin—the visitors who have come to this city from England, Scotland, Wales, and the Irish provinces to take a part in the proceedings of this congress.

HIGH DEATH-RATES IN TOWNS.

The aggregation of a large number of people upon a limited area operates injuriously upon their health and lessens the mean duration of their lives. Many years ago Dr.—now Sir William—Gairdner, of Glasgow, pointed out that whilst the death-rate in England was 15 per 1000 persons living on every square mile, it rose as the density of population increased until it became 27 and upwards when the population came to be 2900 per square mile. The death-rates in purely rural districts have not been very largely reduced since the beginning of the present century; in the towns the case has been different. Before the system of national registration of deaths was adopted there existed the means of closely approximating the death-rates in towns. From the "Bills of Mortality" of London we learn that the death-rate in that city during the period of 1728 to 1780 was about 50 per 1000 persons living. The deaths, therefore, greatly exceeded the births, and were it not for the great immigration into the city from the country its population would have become extinct, as the mean age at death of the citizens was only 20 years. According to Sir William Petty, the deaths in London in six years of the seventeenth century exceeded the births by about five-eighths. He showed that at the same period the same relative proportions between births and deaths existed in Dublin. For centuries the urban death-rates greatly exceeded the rural rates, in many cases by from 20 to 50 per cent.; but during the last forty years they have been approximating, although a gap far too wide still divides them. In 1896 the estimated population of England and Wales amounted to 30,717,355, of whom 14,883,806 resided in 110 town districts, each containing more than 35,000 inhabitants, and 15,833,549 in country districts and towns and villages having a smaller population than 35,000. The death-rate in the urban districts was 18, and in the rural districts 15·3 per 1000, the difference being 2·7 per 1000. The mean rates in the previous ten years were 19·7 and 17·2, a difference of 2·5. Let us compare these figures with the statistics of the decade ended in 1860; in that period the urban rate was 24·7 and the rural 19·9, the difference being 4·8. Gratifying as it is to find the gulf between the urban and country death-rates narrowing, it is unsatisfactory to

observe that the rate of mortality should be so much greater in some towns than in others. In 1897 the rate in Eastbourne was 8·2, in Bournemouth 10·1, Croydon 13·62, and even in the manufacturing town of Darlington 15, whilst in Liverpool it was 26·76, and in Salford 26·88. Brighton, a most fashionable town with a well-to-do population, has a death-rate of 15·23; but Wakefield, Stockton-on-Tees, and Jarrow—all manufacturing towns—had almost the same rate.

CAUSES OF THE HIGH URBAN DEATH-RATES.

The causes which raise the urban death-rates so much above the rural ones are numerous, and, perhaps, not fully discovered. The causes of the enormous difference between the bills of mortality of the healthiest and least healthy of the towns have not been fully investigated. The contagion of the fevers must clearly be more readily conveyed from the sick to the sound in towns owing to the closer contact of the people. The town atmosphere is less pure than the air of the country; its soils are generally contaminated with filth. In its narrow streets and courts the direct sunlight—so necessary to maintain the purity of the air—and thorough ventilation are wanting. The effete matter from dwellings and workshops, and the sweepings of the streets, are sometimes allowed to accumulate and to pollute the air by their noisome exhalations. Many of the occupations of townspeople are of a more or less unhealthy nature, and the majority of them are sedentary. The outdoor life of a farmer and agricultural labourer is obviously more healthy than that of the town bakers, shoemakers, tailors, and millworkers. The cabin of the peasant may be, and, indeed, too often is, a wretched dwelling, but it is at least surrounded by the pure and open atmosphere. In the towns a dozen families often occupy as many rooms in the same house, whilst hundreds of similar houses invest it on all sides. We can hardly expect to make the conditions of infantile life so healthful in town as they are in the country, but much can be done to brighten the life of the children of our great towns, to give a roseate tinge to their pale cheeks, and to strengthen and develop their muscles. Their dwellings should be improved and places for their recreation in the open air liberally provided. The Earl of Meath has generously established in Dublin two gymnasia and playgrounds for children, and the corporation are providing a gymnasium on the open space formed by the removal of an old prison in Green Street. Gymnasia for children are, however, required in all parts of this city and of other cities. As the child is in one sense the father of the man, every effort should be made in favour of the physical, moral, and intellectual culture of those who are to form the future men and women of the nation.

THE SANITARY CONDITION OF TOWNS IMPROVING.

The appallingly high death-rates in towns which continued for many centuries have greatly decreased in the present one. The improvement is partly due to greater attention to personal hygiene and a higher standard of comfort, partly and chiefly to improved public sanitation. The "masses" are now on the whole better fed than they were formerly, their hours of labour are less, and they enjoy more holidays. The causes which rendered so many of the handicrafts unhealthy and even dangerous have been removed, or their effects lessened. During the ten years ended in 1850 the mean annual death-rate in London was 24·8 per 1000 persons living; in the decade ended in 1896 the rate was 19·9, or 4·9 per 1000 less than in the former period. In 1897 the rate was only 17·7, including the deaths of strangers in London. In Glasgow, where vast sums have been expended in the clearing of unhealthy areas and the erection of improved dwellings for the working classes, a great decrease has taken place in the general and zymotic death-rates. In the ten years ended in 1866 the deaths from all causes were in the ratio of 30·2 per 1000 of the population; in the five years ended in 1897 the rate was only 21·8. The death-rate in Liverpool in the years 1866 to 1875 was 31·3 per 1000; in the years

1887 to 1896 it was 25·7, and in 1897, 24·4. The Manchester death-rate was 31 in 1866, 1875; in 1887-1896, 25·3; and in 1897, 23·1. Similar statistics could be quoted in reference to almost every other large town. In all parts of the world the mean duration of human life is decidedly less in the towns than in the country. In comparing the vital and mortal statistics of countries the relative proportion of their urban and rural populations is a factor of considerable importance. Notwithstanding the fact that an increase in the density of a population is unfavourable to health, the rapid increase in the English urban population has not sensibly counteracted the good effects produced by improved public and private hygiene. The density of the population of London has been doubled since 1851. It is truly wonderful that its vast population of 6,291,637, located on only 693 square miles, should have in 1897 so low a death-rate as 17·7 per 1000. This rate is not greater than that of a fairly healthy rural district. England well deserves the name she has received as the birthplace and home of sanitary science and practice. In the period 1851-1870 the deaths in the towns were 25 per cent. greater than the deaths in the country for equal numbers of the people; in the period 1871-1896 the excess was reduced to 13·5 per cent., or nearly one-half. The death-rate is much lower amongst females than males. It may interest intending benedicts and strengthen their resolution to learn that the mean duration of life is greater amongst married men than is the case with celibates. No doubt the former are taken better care of.

VITAL STATISTICS OF IRELAND.

The death-rate in Ireland is for the whole country very low. In the ten years ended in 1896 it was only 18. In the same period the rate in Hungary was 35·6, and in Austria 30. The low rate in Ireland is largely due to the circumstance that by far the larger portion of the population reside in the open country. The urban bills of mortality are very high. In the decade ended in 1897 the death-rate was 24·65 per 1000 in the 23 largest towns. Their zymotic death-rate was 2·64. There is, therefore a great difference between town and country death-rates in Ireland.

HOUSING OF THE VERY POOR.

The improvement in the viability of the working classes which has taken place within the last 30 years is to some extent due to the better dwellings provided for them. Owing to the benevolence of the late Mr. Peabody, Lord Iveagh, and other philanthropists, a considerable number of healthful dwellings have been built for artisans and labourers. A still larger number have been erected by companies, some of which have been founded on semi-philanthropic, semi-commercial lines. In this city and its suburbs the Dublin Artisans' Dwellings Company own dwellings occupied by 2194 families who pay from 1s. 9d. to 12s. per week. This Company is now constructing 188 additional dwellings. The City and Suburban Artisans' Dwellings Company have provided dwellings for 284 families, who pay from 2s. 6d. to 6s. per week; The Industrial Tenement Company own a block of buildings in which there are 46 separate tenements, let at from 2s. to 4s. per week. Many employers of labour, such as railway companies, brewers, distillers, &c., have erected improved dwellings for their employes. Although so much has been done in providing improved dwellings for the working classes, the vast majority of them are still lodged in wretched tenements. A few years ago I had a kind of census taken of the city, and found that 32,000 families were located in about 7000 houses, affording 1½ rooms per family. On the other hand, the remaining 22,000 families of the city occupied 17,000 houses. Whilst much has been accomplished in the way of providing proper dwellings for artisans and the better class of unskilled workers, practically nothing has been done to improve the miserable state of the homes of the very poor. In every large town there are, exclusive of beggars, thieves, and vagrants, &c., many honest people whose precarious earnings barely suffice to keep body and soul together. Amongst this class are to be found small

dealers, pedlars, hawkers, charwomen, rag-pickers, night-watchmen, the inferior class of amstresses, porters, and labourers, the miserable creatures carrying placards, termed "sandwichmen," and men and women engaged in many other poorly remunerative employments. Besides these, there are the dull-witted and the physically feeble people, who are incapable of earning the merest pittance. It is in the wretched homes of these poorest of the poor that the seeds of fever are developed in a hotbed. Their dwellings are a peril to the whole community, for their inmates carry contagious matter into the streets, shops, theatres, and other places. The effluvia from them taints the atmosphere, in the purity of which all are interested. It is the dwellings of the very poor that demand nearly all the attention of the sanitary inspector. He finds almost an impossibility to get their owners—who are often nearly as poor as their tenants—to keep them in even moderately good condition. Since 1879 more than 3000 houses have been re-tenanted and closed in Dublin on account of their insanitary condition; of these not one half have been rebuilt or rendered fit for human occupation. The closing of insanitary houses and the clearing of unhealthy areas have, however, been of little benefit to the poorest of the poor. The people who lived on these unhealthy areas have not returned to occupy the neat dwellings which replaced their wretched tenements. The rents of the new dwellings were beyond their means. The unhealthy areas have been cleared, but the condition of the people who dwelt on them has remained unchanged. They have sought on other areas low-rented tenements as insanitary as those from which they had been ejected. All the lowest-rented and consequently least sanitary of the Dublin tenement houses were compulsorily closed, where, save in the workhouse, could their inmates obtain shelter? I feel convinced that the ordinary landlords of tenement houses, the majority of whom are freeholders only or yearly tenants, cannot provide proper dwellings at from 1s. to 2s. per week, the rent which the very poor can only afford. Dwellings so low-rented can only be provided by the municipality or by philanthropic societies and individuals. They will pay every little, if any, interest on the money expended on their erection and maintenance, but the very unhealthy dwelling which they replace will be a distinct gain to the whole community. The replacement of unhealthy and unhealthy habitations means less illness, longer duration of life, and diminished pauperism. The municipal authorities should be encouraged to provide workpeople's dwellings.

OUR DAYS BETTER THAN THE OLD TIMES.

The belief that former ages were happier than the one we live in does not rest upon a foundation of fact. During many centuries Europe was periodically devastated by pestilences. In the fourteenth century the terrible "black death" carried off 25 millions of its inhabitants. Population stagnated; that of England remained stationary for three centuries, not so much owing to war as to pestilence and famine. In 1664-65 the Plague most depopulated London. In that long and gloomy period, so truly named the "dark ages," the towns were the hotbeds of disease, from which their poisonous seeds were spread throughout the land. Although a great improvement has taken place in the state of public health in these countries and most parts of Europe, a further improvement is required and is attainable. We require, perhaps, some additions to and amendments of our sanitary laws, but what is most required is the thorough enforcement of the laws such as they are—and they confer great powers upon the sanitary authorities. The notification of infective diseases and the laws relating to disinfection should be strictly enforced. Healthy dwellings and cheap baths and wash-houses for the most dependent classes of the community should be multiplied. The unhealthy occupations should be rendered innocuous, or, at least, less unhealthy. The insidious emanations from certain kinds of works could be prevented or reduced to a minimum.

Surveying and Sanitary Notes.

At the Town Hall, Westminster, Mr. Troutbeck and a special jury heard the case of "The Aerated Bread Company Limited v. Her Majesty's Office of Works," a claim for about £20,000 compensation in respect of their leasehold and trade interest in Nos. 31 and 32, Parliament Street, and No. 17B, Great George Street, Westminster, used as a refreshment depot on the ground floor and basement.—The first witness, Mr. Edward Tewson (Messrs. Debenham, Tewson, Farmer, and Bridgewater), stated that the premises in question were let on lease for a term of which ten years was still unexpired, at a rental of £950, and that they were now worth £1600 a year, showing a profit rental of £650 a year. He capitalised that on the five per cent. table (7·7 years' purchase) £5005, and added the customary ten per cent. for compulsory sale, £500, making together £5505. The net profits of the depot were £3260 per annum, and, after deducting the profit rent, £650, and adding £300 for under-lettings of the upper part of the premises, he arrived at a profit of £2910, which should be capitalised at five years' purchase, £14,550, to compensate the company for loss of the business. His total was thus £20,055, to which he added an agreed sum of £410 in respect of the fixtures, making altogether £20,465.—Mr. Henry Charles Trollope (Messrs. Trollope and Sons) confirmed Mr. Tewson's evidence.—Mr. James Harris, chartered accountant (Mr. James Harris, Sons, and Co.), proved that the net profit of the depot in question was £3260 last year, and he was of opinion that five years' purchase should be given.—The jury awarded £9490 compensation.

Work has now been commenced in earnest on the dock extension at Middlesbrough. The dock there was opened so long ago as May, 1842; it was leased to the Stockton and Darlington Railway in 1849; and became the property of the North-Eastern Railway on the amalgamation of the two undertakings named. Since then two enlargements have been made, and by this time the area will be increased from 16 to 26 acres. In the first half of this year, the North-Eastern Railway spent £3717 on the dock extension works, largely in preparation for the more rapid progress that is now anticipated. At the western side of the dock, where operations have been commenced, steam "navvies" and a considerable number of men are engaged in preliminary excavation. It is officially anticipated that in the current six months there will be expended no less than £62,000; whilst the further expenditure after the end of 1898 is stated at £319,320; so that the estimate brings the cost up to the large total of £385,000. From the Tees there is the entrance channel about 1200ft. long, which will be deepened and widened, while the "batter," or slope of the walls, will be removed. The extension of the area of the dock has already been indicated; the depth will be increased; and there will be a considerable increase of the quays in the dock, and also by the making of the two additional "arms" from the western quay, so that there will be an addition of not much short of 3000 linear feet of wharfage. The work is one that will take a considerable time to carry out, but it will give to Middlesbrough one of the finest docks on the east coast.

The new central sanitary depot, upon which the Leeds Corporation is spending over £30,000, is nearing completion, and will be formally opened early next month. The situation of the premises is very convenient. The site is in Dock Street, to the south of Leeds Bridge. Stabling accommodation is here provided for 168 horses. Commodious offices, store-rooms, and sheds for the many vehicles that are used in the scavenging and water-cleansing department are also being built. At present the only stables the Sanitary Committee can call their own are a few wooden structures in Black

Bull Street. Over 100 of the 150 horses belonging to the department have therefore to be sent to private stables. The land on which the new depot is built has cost about £20,000, whilst the buildings will necessitate an expenditure of about £13,000. The whole of the land, however, is not being used for the purposes of the depot. About 1000 yards are being utilised to widen Dock Street and the other thoroughfares bounding the site. The Sanitary Committee are also credited with £8000 for their old site at Crown Point, which has been demolished to make room for the electrical generating-station. In addition, the Committee have received £1000 for their old buildings and appliances. It may be taken, therefore, that the net cost of the new depot and of the land which is being used for the widening of the adjoining streets does not greatly exceed £20,000. For this sum the Committee obtain commodious offices for their officials, stables for their horses, shelter for their vehicles, and a capital centre for carrying on the important work which devolves upon the street-cleansing and scavenging departments.

DURING recent years the need of a better supply of water to the populous parishes within the Hemsworth Rural District has on frequent occasions occupied the attention both of the old sanitary authority and of the present District Council. Schemes had been promulgated for obtaining water in turn from Dewsbury, Wakefield, Thorpe-in-Balne, and Pontefract, and each was found impracticable. At length the Council decided to support the Barnsley Corporation in an endeavour to pass a bill through Parliament, with an undertaking to supply the townships in their district. The work has since been pushed forward in every possible way, and, although it is but twelve months since the tenders were opened, that of Messrs. Young, contractors, Wakefield and Bradford, being accepted, last week saw the practical completion of the work so far as concerned the supply of the eight townships which joined in the scheme. The water has to traverse seventeen miles of mains from Ing-birchworth and Midhope before reaching the Ringstone Hill reservoir, about two miles to the south of Hemsworth.

New waterworks have been opened at Barton-on-Humber. The original works were built in 1888. The works consist of boiler, engine, and filtering houses, manager's house, and storage tank, capable of holding 120,000 gallons. The well is 120ft. deep, with a bore 25ft. deeper. There is a set of double pumps, capable of raising 23,000 gallons of water per hour.

At a private meeting of the Llanelly Commissioners a day or two ago the contractor of the new dock reported that progress had been somewhat slow, because he had to cope with a tremendous quantity of hard clay and rock. He had now, however, arranged for a special steam navy to be sent down for the contract, and once this was in operation they would be able to work more quickly. With regard to the purchase of a bucket dredger, the Commissioners decided to give a trial to one of 400 tons, the price asked being £7500. Tenders for the dock gates were also received, and that of the Thames Iron Company at £3000 was accepted.

NEXT Session a bill will be promoted by the towns of Leicester, Derby, Belper, Nottingham, and Sheffield, for the acquisition of the whole of the rights of the waters of the upper Derwent, which will secure a minimum water supply of more than fourteen million gallons per day. The estimated cost of the entire scheme is between three and four millions, and the water will have to be conveyed a distance of sixty-six miles. Liverpool, Manchester, and Birmingham have all sought fresh sources of water supply in Wales, and the population of Leicester is increasing so rapidly that the Corporation fears the supply will not be equal to the demand of a few years hence. Hence the need of seeking fresh fields.

PARIS ABATTOIRS.*

By R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page xiii.)

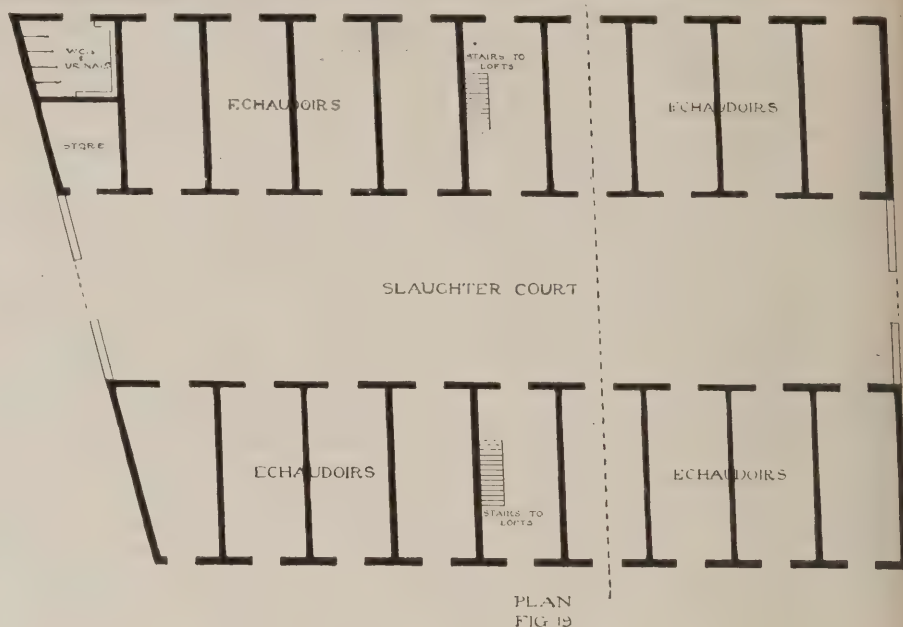

BETWEEN each range of stables are placed the killing courts, with "Echaudoirs" (carcase scalding and cutting up rooms) on either side, E E (Figs. 19, 20, 21, 22). The animals are brought into this court from the "Bouveries" and "Burgeries," are then killed, and the carcasses skinned and prepared for transferring to the "Echaudoirs."

This work is carried on at each side of the court, and constitutes a very weak point in the arrangements of these abattoirs, owing to the fact that several animals are necessarily standing near whilst their companions are being killed. There is no doubt that they are fully aware of their fate, and often become terrified and unmanageable. This obviously faulty arrangement has been avoided at "La Rive Gauche," described in a future article.

Sliding iron gates are provided at each end of the "Killing Courts," being stronger than the wooden ones. This precaution is necessary in case the animals become refractory.

The floor of the courts slope towards the centre, in which there is a channel to receive the drainage. It is noticeable how slightly this drainage is charged with blood, as during the process of killing this is all collected, and used as hereafter described.

The "Echaudoirs" on each side of the court are separated by brick walls, the upper portions being in perforated brick panels.

PROPOSED PUBLIC ABATTOIRS FOR LONDON.

THE Public Health Committee of the London County Council have issued a report, in which they deal with the desirability of the establishment of public slaughter-houses throughout London. The Health Committee

Builders' Notes.

IN connection with the termination of the Bristol building trade dispute, a specially convened meeting of the Master Builders' Association was held a few days ago, at which the recommendations of a committee of the association were considered. Mr. C. A. Hayes presided, and, on the motion of Mr. E. Walters, seconded by Mr. George Wilkins, the following resolution was agreed to:—"That, as the Bricklayers' Society has eventually accepted the mediation of his Honour Judge Austin, the members of the Bristol Master Builders' Association are prepared to act upon his Honour's suggestion—viz., to give the rise in wages forthwith, and as the federated trades and the Masons' Society have honourably stood by the award of the Board of Trade arbitrator (Mr. A. A. Hudson), the committee of this association is prepared, as an act of grace, to recommend its members to grant a similar concession to those trades after next pay day."

The temporary bridge over the Thames at Vauxhall is now open to passengers and vehicles, and this week the familiar and cramped old bridge is to be closed, and preparations for reconstruction commenced. The temporary bridge, which stands on nine wooden piles, has a centre span of 160ft. There are in all ten spans, the river being here about 700ft. wide. At first the centre span was 80ft., but it was found that barges and other large vessels using this part of the river fouled the piles, and hence the expansion. The spans are constructed of steel girders,

SECTION AB
FIG 20

Large double doors are provided to facilitate the work of carting the meat.

* This series deals with the construction of the Cattle Markets and Abattoirs of La Villette and La Rive Gauche, Paris.

(To be continued.)

A TOWER has been added to the Thoraby-on-Tees parish church. The church was built in 1858, at a cost of £3000, and a tower has now been added at a cost of £1400.

propose to submit their opinions to the Local Government Board, together with an intimation that the Council are prepared to accept such responsibilities as may be necessary to give effect in London to the recommendation of the Royal Commission on Tuberculosis, and to ask the Local Government Board whether they will include in any legislation introduced by them in connection with the Commission's report the provisions that will be necessary for that purpose.

PART ELEVATION OF
ECHAUDOIRS FIG. 21.

which, in the centre arch, are latticed. The roadway is 22ft. wide, and two 6ft. pathways are carried at the sides on cantilevers. Gas lamps have been erected at convenient intervals. At first it was proposed that electricity should be used, but only one bridge over the Thames—Waterloo—is thus lighted, and there it is found that the glare tends to dazzle. Bargemen, who occasionally foul the buttresses, say the excessive light is to blame rather than their powers as helmsmen.

THE demolition of the present bridge will be commenced at the end of this month, and everything will be ready for the work of reconstruction early in September. The new bridge will have five arches—in number four less than in the structure to be replaced. The centre one will be about 155ft. across, the remaining four being only a few feet less. The piers will be of concrete, faced with stone, and the arches will be constructed of the same material. This is the first bridge with such a large span ever built in England of concrete. It will cover the same site as the old one, and in width will equal Westminster Bridge, which is 80ft.—that is, almost double the capacity of the superseded bridge and of any other crossing the river, save the beautiful structure at the Houses of Parliament. Besides widening the

TRANSVERSE SECTION
OF ONE ECHAUDROIR
FIG. 22

bridge the London County Council have decided to enlarge the approaches very considerably. The cost of the bridge alone is estimated at about a quarter of a million sterling, which is, roughly speaking, £50,000 less than the sum expended in the erection of the one to be removed. Three years will be required for the completion of the work. When Vauxhall Bridge is ready for traffic again Lambeth Bridge will be demolished and reconstructed. The temporary structure, which has been built to last at least ten years, will be left standing until the second undertaking is completed.

THE annual outing of the Exeter and District Master Builders' Association was held on Friday week. The party, numbering about forty, took train for Otterham, North Cornwall, leaving Queen Street Station at 7.7 a.m. Arriving at Otterham Station, breaks were in waiting to convey the party to the Wellington Hotel, Boscastle, where breakfast was served. Boscastle having been explored, the breaks were ready again at 12.30 for a drive to Tintagel. King Arthur's Castle and other places of interest having been visited, the party again returned to the Wellington Inn, Boscastle, where dinner was served at 5 p.m. Mr. H. Passmore took the chair and was supported by Messrs. Sampson and Bayley. The members afterwards drove to Camelford, and thence proceeded home to Exeter by train.

THE greater part of a three-story tenement at 77, Nicolson Street, Edinburgh, collapsed a

few days ago. The premises consisted of a shop on the ground floor and two flats and attics of dwelling-houses. The tenement immediately to the south of the building had recently been demolished, and for some time workmen had been engaged making excavations with a view to laying down the foundations of new business premises. For the purpose of constructing cellars excavations to the depth of about 10ft. had been made, and as the result of these operations the foundations of the adjoining building had been affected. Indications of this had shown themselves for a day or two, and while workmen were engaged shoring the building, and while some of the Burgh Engineer's men were making an inspection of the premises and overlooking the work of shoring, the gable wall sank on its own foundation, and the entire south half of the building collapsed, carrying everything with it from the attic to the ground floor, but without injuring any of the workmen employed outside. They had observed the dangerous condition of the wall, and had only time to escape before the crash came. Part of the mansard roof, which was left overhanging, was subsequently removed.

Trade and Craft.

MESSRS. BRAUN AND CO.

Messrs. F. Braun and Co. are carrying out the art metal work in connection with the Orwell Hotel at Felixstowe; the work includes gas fittings throughout the building, saloon bar grilles, outside bracket and pillar lamps; and grilles and signs. All these fittings are receiving an artistic treatment, which will give finish and feeling to a sumptuous interior. The architect is Mr. T. S. Cosden, of Ipswich.

MESSRS. LUMBY, SON, AND WOOD, LTD.

We have before us the supplementary catalogues of Messrs. Lumby, Son, and Wood, of Halifax, in three sections, dealing respectively with safes, boilers, and copper boilers. In place of the list of successes with which one is familiar in the safe lists, as a rule, this firm is able to state that the safes made at the Halifax works have never failed, and this is a statement that is bound to have no small weight when the question of a safe or strong room is under consideration. The list of pioneer boilers, in addition to the information upon the articles themselves, is a specially useful feature in the series of memorandum pages at the end—and this indicates the shrewdness of the designer, who takes care that the catalogue shall not be thrown away when first looked at, and then forgotten. Nobody can now afford to despise any medium for making a hasty note, and here the note and the article of manufacture are found together. By way of practical preface to the list we find the following:—"Lumby, Son, and Wood, Limited, are specialists in the manufacture of welded work of every description, and the oldest and largest makers in the world of wrought-welded boilers, and have always received the highest awards wherever exhibited, including two gold medals and one silver medal at Paris, 1878 and 1879, and Grand Prix and silver medal at Brussels, 1897."

MESSRS. E. F. BLAKELEY AND CO.

Messrs. E. F. Blakeley and Co., of Liverpool, inform us that they have removed to more extensive premises in Vauxhall Road and Banastre Street, where they now undertake the supply and erection of any description of galvanized corrugated iron roofs, buildings, churches, bungalows, steel and iron principals, girders, &c. They are at present supplying three large schools for Liverpool and Salford School Boards; a mammoth iron riding school for Mr. C. Arthur Pearson, at Farnham, Surrey; roofing for silk mills at Leek, &c.

The Story of an Appointment.

MR. A. H. JENNINGS, surveyor to the Carlisle Urban District Council, writes:—"I am reluctantly compelled to draw your attention to the result of an appointment which is deserving of publicity through your valuable paper. The advertisement ran as follows: 'The Urban District Council of Erith require an inspector to superintend the laying of private drains and connections to the sewers of the Council, and to inspect the construction of new buildings, and generally assist the surveyor. He must have a practical knowledge of works of drainage, the construction of buildings, the preparation of plans, and be fully competent to keep all books and accounts connected with the office of surveyor. Salary, £140.' The applicants, I understood, numbered nearly 150, and a selection of six was made to interview the Council, and to 'produce original testimonials, with specimens of plans and draining work.' Being a selected candidate, I made my appearance at the appointed time, and found my chances more favourable than expected, two being absent. Meeting my fellow-candidates, I soon found, to my surprise, that their respective callings were as follows: (1) Bricklayers' foreman, (2) bricklayer, (3) carpenter (a former member of the Council), but, unfortunately, out of work. The monotony of waiting an hour and a half was broken by mutual conversation, chiefly on the laws of sanitation, but when an attempt of mine to advance the cause of smoke, air, and water for the testing of drains was derided, I held my tongue and spoke nothing. At last we were summoned before the Council. I produced my qualifications, original testimonials, and specimen drawings of street work, sewers and drains; also copy regulations for private house connections to main sewers in this district (the supervision of which has been one of my chief duties), when I was catechised by the apparent supporters of the local man on such questions as these: Had I ever used a trowel? Could I lay bricks? Had I experience with jerry builders? And similar questions. On the local carpenter being called a second time my hopes vanished, for it was soon announced that he had been successful, although I was informed the voting between him and myself were equal, the chairman giving his casting vote in the carpenter's favour because he was a local man. My cause for complaint is the misleading advertisement, which tempts so many experienced and qualified men to waste their valuable time in applying for an appointment when the result is practically known beforehand. Why should not the Council of Erith advertise locally if a local man, even if devoid of experience, is intended to be appointed against all comers, of whatever qualifications they may possess. If the Erith Council had been wise they would have left the appointment to the engineer of their sewerage scheme, or even the surveyor. This scheme, I understood, costs nearly £100,000, and its success depends largely upon the manner in which the private house drains are connected. Time will prove the folly of such a procedure. Yet this is a council, I presume, pledged to study the interests of their ratepayers and uninterested devotion to the public service. I enclose herewith the local paper, marked, giving particulars of the appointment, and editorial comments in stronger and more eloquent terms than words of mine have described."

BURY ST. EDMUND'S Town Council have accepted tenders for electric light works, amounting in the aggregate to £22,500, subject to the approval of the loan by the Local Government Board.

THE contractors for the construction of the Central London Railway line from Shepherd's Bush to the Mansion House have just commenced the construction of an air-lock at the Davies Street Station, near Oxford Street.

MR. W. H. TRESIDDER has prepared a plan showing proposed alterations at the Town Quay, Falmouth, including an extension of the southern pier 100ft. seaward. It is roughly estimated that the scheme will cost £2000.

Property and Land Sales.

GILLOW AND CO.,

(Waring and Gillow, Ltd.),
406, OXFORD STREET, W.,

Established at the above address over 100 years.

HAVE a large and most desirable selection of all the best Shooting, Fishing, Hunting, and Winter Quarters in the Market, and will be pleased to submit a list of same free on application. Telephone No. 30, Paddington.

BERKEENSHIRE (24,158).—An excellent SHOOTING BOX, very nicely furnished, modern sanitation. The accommodation includes eleven bed rooms (making up fifteen beds), large library, bath room, w.c.'s and lavatory, and four reception rooms. Complete domestic offices. Three-stall stable, coach-house, harness room, loft and rooms over. Well laid out grounds, with two tennis lawns. Greenhouses and kitchen garden. September and October, 100 guineas inclusive.

BERKSHIRE (3122).—In lovely scenery, looking on the Downs and extensive Commons close at hand. In 3 acres of grounds, well timbered on all sides except the south, to which the house fronts. Contains dining room, drawing room, kitchen, three large bedrooms, one smaller; store cupboards, larder, &c. Stabling for three horses. Trout fishing in River Embourne, also good winter fishing. Shooting to be had in the neighbourhood. Plots and lines nearly new. Comfortably furnished. —Terms and full particulars as above.

ESSEX (3186).—To be let from October 1st till January, 1899, a most comfortable MANSION, with Shooting over 3500 acres. The Residence, which is situated within easy access of the Metropolis, contains five reception rooms, twenty-two bedrooms, dressing and bath rooms, &c. Stabling for ten horses. The estimated bag will be about 2500 pheasants, 1000 partridges, 100 hares, a few wildfowl, &c. Terms and full particulars as above.

LINCOLNSHIRE (3100).—A most important RESIDENTIAL ESTATE of 9000 acres. The Mansion is of great antiquity, and contains five reception rooms, thirty-five bedrooms, &c., and stabling accommodation for thirty horses. Terms for hunting and shooting season, 500 guineas. Tenant to keep up mowing gardeners, gamekeepers, &c.

SUFFOLK (315).—A first-class FAMILY MANSION, standing in a park of 200 acres, with shooting over 5000 acres. Contains five reception rooms and billiard room, thirty-five bed, dressing, and bath rooms, and fourteen servants' rooms; stabling for twenty-two horses. Rent 850 guineas per annum. Tenant to keep up.

BEDFORDSHIRE (25,191).—An excellent HUNTING BOX, standing in its own grounds, and within a few minutes' walk of Leighton Buzzard. Contains four bedrooms, fitted bath, two sitting rooms, capital domestic offices. Freehold to be sold, or would be let on long lease.

BERKSHIRE (25,213).—A splendid ESTATE with MANSION, standing in beautiful park of 50 acres. The house contains twenty-three bed and dressing rooms, bath room, double dining and drawing rooms, morning and smoking rooms, billiard room, and chapel. Stabling for twelve horses. With woods, farms, &c., making up a total of 780 acres. —Price and full particulars as above.

BUCKINGHAMSHIRE (344).—A most charming FREEHOLD PROPERTY, standing on its own well laid out grounds of 32 acres. The mansion contains five reception rooms of lofty and noble proportions, sixteen bedrooms, dressing rooms, &c.; stabling for five horses. Would be sold or let for a term of years. —Apply as above.

CANADA (3437). on the Canadian Pacific Railway, and within 80 miles of Montreal. —A RESIDENTIAL ESTATE, situated on the banks of a lake, with unrivalled shooting, fishing, and boating facilities. Contains ten bedrooms, two bath rooms, lavatory, store room, five excellent reception rooms, stabling, &c. The Freehold to be sold. —Apply as above.

HAMPSHIRE (3422).—A magnificent MANSION and PARK of 185 acres, overlooking Southampton Water. Bracing climate, yet sheltered from north and east winds. Contains five reception rooms, twenty bed and dressing rooms, bath rooms, &c.; eight-stall stabling. The freehold to be sold, or could be let furnished. —Apply as above.

GILLOW AND CO.

SUSSEX.

SOUND LANDED INVESTMENTS.

SMALL SPORTING ESTATES, 13 FARMS, FULLY LICENSED INN, RICH MARSHES, WOODLANDS, ACCOMMODATION AND BUILDING LAND, COTTAGES, &c., being the outlying portions of the Sussex Estates of Sir James Duke, Bart., and extending to about 2750 acres, divided into numerous lots. They comprise:

Magham Down and Cottages in Hailsham and Hurstmonceux.

Amberstone Farm, Accommodation and Building Land in Hailsham.

Hempstead Farm and Building Land in Hellingly.

The Whyte Estate, East Hoathly, a capital sporting property, with grand coverts.

Squire and Tuett's Farms, Framfield.

The Merry Harriers Inn and 16 acres, Cowbeech.

Cowbeech House and Farm.

Beech Hill Estate, about 390 acres, of which 81 are wood. One of the most complete little sporting properties in the county.

Clippingham Farm, Hurstmonceux.

Straight Ditch Marshes in Pevensey Level.

Sandhill and School Farms and Marshes, Hoos.

Holmbush Farm, Hellingly, 83 acres.

Carter's Corner or Cowbeech Hill Farm, 46 acres.

Strood and Gatchhouse Farms and Woodlands at Chiddingfold.

Swansbrook Wood.

West-street Farm, Hellingly.

All the lands are let at fair rentals and mostly to tenants of long standing, and offer a good opportunity for the sound investment of capital in an improving security.

Many of the properties have long frontages and could readily be sub-divided or developed, there being a large demand for small residences in the district.

HAMPTON AND SONS

Will SELL the above valuable estate; by AUCTION, in numerous Lots, at the White Hart Hotel, Lewes, on TUESDAY, SEPTEMBER 6th, at THREE o'clock precisely (unless previously disposed of privately).

Particulars and Plans of the Vendor's Solicitors, Messrs. PONTIFF, HEWITT, and PITT, 15, St. Andrew-street, Holborn-circus, E.C.; of Messrs. DRAWBRIDGE and ANSE L, Estate Agents, Hayward's Heath, Sussex; and of the Auctioneers, HAMPTON AND SONS LTD., 1, Cockspur-street, London, S.W.

OFFICES: 1, COCKSPUR-STREET, S.W.

To Builders, Small Speculators, and Others.

SOUTHALL, MIDDLESEX.

A number of Valuable Freehold Building Sites, comprising a portion of the highly favoured building estate, known as "The Southall Building Estate," situated in the parish of Southall, about five minutes' walk from Southall Station on the Great Western main line, and thirty-five minutes by rail from the City.

The estate is laid out with a 45ft. road, planted with trees this autumn, sewer and kerbed and channelled; and house connections being laid up to the edge of the footpath.

The sites facing the High-street are eminently suitable for the erection of good class shops, whilst those facing the Lady Margaret-road are intended for villas with rentals of from £30 to £40 per annum, for which there is a great demand.

MESSES. WALTON and LEE will offer the above for SALE by AUCTION, at the Red Lion Hotel, Southall, Middlesex (about five minutes' walk from Southall Station), on WEDNESDAY, SEPTEMBER 31st, 1898, at SEVEN o'clock precisely in the evening of that day.

Particulars of sale may be obtained of Messrs. FRESHFIELDS and WILLIAMS, Solicitors, 31, Old Jewry, E.C.; or of the AUCTIONEERS, at their offices, 10, Mount-street, Grosvenor-square, London, W.

OLD OAK FRAMING from an Old Tithe Barn FOR SALE.—Apply, TAYLOR, East Isley, Berks.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required. —For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. —For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

PARTNERSHIP.—Young ARCHITECT of good London training, DESIRES WORKING PARTNERSHIP in established firm. Is an able designer and draughtsman, with good practical experience. —Address, ARCHITECT, care of J. E. Farrar, Esq., Solicitor, Halifax.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

COSTING CLERK REQUIRED, accustomed to Builder's or Engineer's office. Must be quick at figures. One with a knowledge of architectural drawing preferred. —Address, stating age, qualifications, and salary, with copies of testimonials, to Box 996, BUILDERS' JOURNAL OFFICE.

ARCHITECT'S ASSISTANT WANTED.—If by letter, stating age, experience, and salary required to S. BARNETT, Builder, 81, Salisbury-road, Queen's Park Station.

ARCHITECT'S ASSISTANT Required at once. Good designer and specification writer. —State age, experience, and salary required, "Architect," care of Hooper and Batty, Advertising Contractors, 15, Walbrook, E.C.

QUANTITY SURVEYOR'S ASSISTANT WANTED, to abstract, bill, and prepare accounts of extras and omissions; also ARCHITECT'S ASSISTANT.—State age, salary, references, and when disengaged, to ALFRED ROBERTS, Architect, 18, Nelson-street, Greenwich, S.E.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES TO ASSIST others in the PREPARATION OF DRAWINGS at his own office.

G. SCORER, 28, Newman-street, W.

ARCHITECT AND SURVEYOR'S GENERAL ASSISTANT DISENGAGED. Thoroughly competent. Office routine, surveying, levelling, &c. Salary 30s. for London. —MORAN, 45, Torrington-square, W.C.

ARCHITECT'S ASSISTANT DISENGAGED shortly. Good draughtsman; specifications, knowledge of quantities, shorthand. Midlands preferred. —Address, "Nottingham," Office of BUILDERS' JOURNAL.

ARCHITECT AND SURVEYOR'S ASSISTANT (26) requires ENGAGEMENT. Experienced in plans, specifications, dilapidations, and inspection, &c., of works in progress. Good experience in estate work, and competent at land surveying and levelling. Assistance also given with quantities. —Apply, C., 25, High-street, Hemel Hempstead.

BUILDER'S ASSISTANT MANAGER desires RE-ENGAGEMENT. Well up in every branch; ten years' experience; good references. —K. L., Office BUILDERS' JOURNAL.

PRACTICAL SURVEYOR is open for ENGAGEMENT as SUPERINTENDENT. New buildings or alterations. Factories a speciality. Good references. Terms, &c., by letter. —SURVEYOR, Deptford Constitutional Club, 411, New Cross-road, S.E.

HOSPITALS and INFIRMARIES.—Expert confidential ASSISTANCE. Formerly draughtsman for Local Government Board; highly successful in competitions, for which moderate speculative terms are offered. —G. B., Caen Cottage, Ryde, I.W.

TELEGRAMS: "Dividore, London." TELEPHONE No. 1011, Holborn

HIGHEST AWARDS.

ALBION CLAY COMPANY LIMITED.

SOLE MANUFACTURERS of the  "GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "**Granitic Stoneware**" Pipes are made from "**Stoneware**" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM.

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage** and **Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers** and **House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious** and **imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.

JONES & SYKES' PATENT CHANNEL BENDS FOR **MANHOLES** AND **INSPECTION CHAMBERS**.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS, STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

Works: **WOODVILLE, BURTON-ON-TRENT.**

CHIEF LONDON OFFICE: **18, NEW BRIDGE STREET, E.C.**

LONDON DEPOT: **MIDLAND RAILWAY (Somers Town Goods Station), OSSULTON STREET, EUSTON ROAD, N.W.**

Old London Shops. THE clearances in Clare Market are sweeping away a great number of crazy tenements that too long have cumbered the ground in what has now become the central part of London. Little of interest is disappearing with them, save, indeed, a relic of old-time shopkeeping—the last of the old “bulk-shops,” once upon a time the usual type of shop in London. This particular sample was (for now that these lines have been written it has been demolished) a venerable old place in Gilbert’s Passage, occupied by a poulterer. The “bulk” which gave these shops their distinctive name was a fixed projecting board or bench running along the frontage, outside the shutters. This bench was almost always accompanied by an overhanging pent, as seen in the illustration herewith. The old bulk-shops afforded a nightly resting-place in the “good old times” to men whose names have become famous, for on these hard and unpliant beds were wont to sleep the authors, the poets, and the analysts of that era when the Grub Street corks were the aristocrats of their profession, and the ancestor of the modern reporter presented the deepest depths. Genius was a stranger to the bulk as a bed, for Richard Savage was used often to couch on one for the night, to be rudely awakened by indignant shopkeepers in the early morn and named for a dissolute rogue; and Nat Lee, pressed from a drunken sleep to death on a plank in Clare Market—perhaps even on this very spot. He and his fellows caroused till closing time in the taverns of their day, and, when they were thrust forth into the streets, snored upon bulks till morning came and woke them to their hard and workaday world. From these semi-erary references we may turn to a notice of the shops that succeeded the bulk-shops of the seventeenth century. We all know the eighteenth century to have been a time of the utmost desolation so far as Architecture is concerned; but to this general rule, as all others, some exceptions may be urged. There was a notable time for the designing of shop-fronts, and until quite recent years there were excellent examples of design in this kind of artistic effort to be met with in the Soho quarter of London in particular. There are some few in that neighbourhood even now, but the really delightful instances were swept away at about that time (now somewhere about ten years ago), when Shaftesbury Avenue and Charing Cross Road were driven through the old streets of that district, and records of them are only now to be found among the very fine series of photographs issued from fifteen to twenty years since by the Society for Photographing Relics of Old London. It is quite worth the while of architectural students to look up the list of the Society’s photographs, which, by the way, may readily be referred to in the Corporation Library, Guildhall.

C. G. H.

The Extension of Flatland. TIME was, and that not so long since, when it was one of the most implicitly believed-in maxims of the building trade that “flats” could not be made to pay for their construction anywhere out of the four-mile radius. This dictum was supported by two arguments—that of the exorbitant cab fares liable to be levied outside that radius on suburban residents, which, by themselves, it was held, would hinder the popularity of the new dwellings; while the second argument was the double-barrelled one that the very *raison d’être* of flats was their provision of centrally-placed residences, at a reasonable inclusive price, for business people to whom a suburban home, with the waste of time incurred by daily journeys to and from London would be altogether too irksome. Such people, it was argued, to whom time was valuable, would not inhabit “barracks” in the debateable land, half country and half town, with which London

from their own doorstep, which everyone desires in these days. These are factors which have made, and are still actively making, building land within a ten-mile radius of town exceedingly valuable in these latter days. Nor must we omit to mention the new era of subterranean railways which is dawning, and bringing with it exceedingly cheap and rapid transit. It is largely owing to these that flats will, in the very near future, be erected on the best sites round London. The cab-fare outside the radius will then be a disestablished bogey. Already we begin to see this new order of things. The healthy heights of Hampstead have numerous examples of well-appointed flats, of very pleasing elevations, while on Richmond Hill the first block of flats was opened last year. It is here, in this hillside town, overlooking the lovely wooded valley of the Thames, that suburban flats will find their best reasons for existence, and here they must in the near future be multiplied amazingly. There will, without doubt, be those who will raise an outcry against it, but an increased and increasing population must

THE LAST OF THE OLD BULK SHOPS, GILBERT'S PASSAGE, CLARE MARKET, W.C.

is surrounded; for if they could endure the daily journeys they would assuredly require a recompense for that inconvenience in retired suburban villas, where they could enjoy the rustic delights of lawns and gardens of their own. But Suburbia has changed wonderfully since flats began to be built in London, twenty years or so ago. The rustic villages within easy reach of the Metropolis have nearly all grown into townships, and the suburban villa commands a very high rent nowadays, supposing it to have a garden worthy the name. At the same time, the appreciation of country scenery, or so much of it as the surroundings of London have to show, has grown wonderfully, and a very large proportion of business and professional men live by preference eight or ten miles out. Not all these folks, although ardently desiring these semi-rural surroundings, are of that Cincinnatus-like disposition which delights in gardening work, and a residence in pure air and quieter surroundings suffices for them, together with that immediate access to the veritable country

be housed, and it is better, for the preservation of rurality, that such building that is to be done should be done perpendicularly instead of laterally; while at the same time it should be noted that the speculator who invests huge sums in flat-building is better able to command and to afford good elevations than the builder of the ordinary-sized villa. Kensington has, of course, become a classic example of how the value of land has gone up since flats were introduced. Following the great boom in building operations that took place in all that district after the exhibitions of 1851 and 1862 had run their appointed course, when the Cubitts had considerably overbuilt, there was actually a very serious drop in rents; and it will be very well within the memory of our readers that some fifteen years ago many of the large and expensive houses in the Cromwell Road were “To be let” for long periods. Then the happy thought took the landlord of them to convert these redundant or too highly rented houses into flats, since when they have been prosperous enough.

C. G. H.

ARCHITECTS WE KNOW.

MR. ARTHUR B. PLUMMER, F.R.I.B.A.

IT is apt all too readily to be forgotten that in the Profession of Architecture the major portion of the striving is of a quite unromantic, if not prosaic, order; and that it is only an artificial convention that accords such importance to the small field of "design." Even in those arts whose sole *raison d'être* is to please, it will be recognised that but a few of their votaries can find occupation in the highest flights of their art, and that for each one who would aspire to the lofty ideal methods of Mr. Watts, let us say, several score will perform find employment in those crude presentments of the comely, the dramatic, and the pathetic, which delight the generality of the people; so that in Architecture, whose first claim is necessity, and whose vital principle is utility, coupled with the most complete fulfilment of needs, and economy of means to ends, it is apparent that a very large percentage of its practitioners will need to be men whose minds must be almost exclusively applied to the structural and economic needs of Architecture, and whose hours must be in chief absorbed in the huge business processes connected with the affair of raising buildings.

It must be remembered that the great bulk of the buildings raised in this country are necessarily quite removed from any serious æsthetic intention in their designs, and that even of those that require the direction and supervision of an able and experienced architect, by far the larger number have their design held completely subservient to the needs of plan, and section, and to those of durability and cheapness; and all these considerations have to be so neatly and exactly balanced one with another, that the margin for selection and arrangement is reduced to a minimum, and forbids any real attempt at "design."

Under the artificial estimate obtaining in the field of Architecture, which has been above indicated, it has grown the custom somewhat to overlook those men who by ability and hard work have won for themselves positions of power and importance in the practice of the less romantic phases of Architecture; and the hurry of activity which seizes and proclaims a new æsthetic departure, let us suppose, in the proportioning of a half-timbered gable, often quite overlooks more solid and more real benefits to the raising of buildings. In these days of much architectural cry, and no considerable amount of architectural wool—when, we are to believe, young architects yearn not so much to considerable building as to the immortalising of their own individuality in some knack of inverted proportion, or other innovation in the shaping of architectural forms, or application of material—it is interesting to be reminded of a man who, although in his student days he exemplified his ability for the rôle of the æsthetic architect, has yet been content to take the fat with the lean, as the saying is, and satisfied to cull success from the practice of the wider aspects of Architecture, rather than among the pale, æsthetic joys of the all art architect to whom a drain-pipe seems almost an impropriety; and such a man do we find in Mr. Arthur B. Plummer, the subject of this article.

Mr. Plummer, whose professional career is associated with our northern counties, his business centre being situated in Newcastle-on-Tyne, with an auxiliary office in Durham, also owes his early education and the first stages of his professional training to these cities, for he was born in Newcastle, of which his father was an alderman, and it was from Durham School that he entered the office of Mr. Mathew Thompson, of Newcastle, as an articled pupil. Nor was there, in his case, much doubt or indecision on the momentous matter of choosing his profession. At school he had already shown an aptitude for drawing, in which he had taken a first prize, and he had further classed as "excellent" in freehand drawing in the Second Grade

Examination of the School of Art. After remaining with Mr. Thompson for four years, during which time he had a varied and wide experience, which included the designing and building of such diverse and opposed subjects as churches and breweries, mansions and work-houses, Mr. Plummer left Newcastle for the purpose of enlarging his experience and availing himself of the educational advantages offered to a young architect in London. Here he worked for six years in the offices of various architects, notably that of Messrs. Hammack and Lambert, where he had opportunities of gaining intimate knowledge in valuations, light and air cases, arbitrations, estate management, and all the ramifications incidental to a large architectural practice. Nor in those days did he neglect the other aspects of the Profession, for he found time to attend Professors Barry and Streets' lectures at the Royal Academy, and others delivered at the Royal Institute of British Architects (of which he himself was elected an Associate in 1880), besides attending sundry of the classes at the Architectural Association, and obtaining, for a set of measured drawings of Waltham Abbey, the annual prize given by the Architectural Union Company; so that, when in 1882 he returned to Newcastle, he was entitled to feel some confidence in opening an office of his own as an architect and surveyor, and, as events proved, to initiate that large and important practice with which his name is now associated.

Like his earliest master, Mr. Thompson, and, indeed, like the heads of other large architectural practices outside London, Mr. Plummer is professionally omnivorous. Any consideration of the long tally of the works of the firm of Messrs. Plummer and Burrell reveals that apparently there is no class of building to which it has not subscribed, and no phase of work incidental to building or surveying of which it has not had experience. Churches restored, churches built, board schools, lunatic asylums, workshops, mansions, villas, homes, and parochial buildings are by no means all the fish that come to Mr. Plummer's net. Nor does this afford him sufficient scope, for he adds to these duties of architect and surveyor those of diocesan surveyor and secretary to the Northern Architectural Association, a post he has filled for several years, albeit the work and responsibility devolving upon the holder are by no means inconsiderable.

Mr. Plummer's name will be also remembered in connection with several interesting papers which he has read before various societies on different occasions, and which were published in the professional journals. Of these we may mention that read before the Northern Architectural Association upon the subject of "The Planting of Trees in Streets and the Different Effects Obtainable," which attracted a good deal of attention otherwise than locally, calling forth a leader on the subject in the Daily News, and prompting the "English Arboricultural Society" to elect Mr. Plummer into its membership; and in particular, a valuable paper read before the Sanitary Congress at Newcastle last year upon the subject of "Flush Tests," embodying the result of a number of original experiments in the flushing of drain-pipes, instituted and carried out by Mr. Plummer in conjunction with the Newcastle Water Company. By these experiments, Mr. Plummer established yet again the supremacy of the small pipe over the large, and was able to satisfy himself that, in all but very exceptional cases, a two-gallon flush is sufficient. After a series of experiments, occupying several days and covering many different conditions, and various types of sanitary fittings, it was found that the 4in. and 3in. glass lined metal pipes gave the best results. As a result of these experiments, Mr. Plummer suggested the use of a pipe which, while retaining the circular shape which is important for the handling of drain-pipes, yet showed in section an interior shaped so as to perfectly fulfil all the useful functions that are attributed to the oval-shaped drain; the bottom of the pipe being shaped in the form of a channel of such small dimensions as would assume the thorough

clearing of the drain with a small flush, while the upper portion was widened to cover the needs of a much larger pipe, and secure that any heavy charging of the drain, by flood water or otherwise, would be speedily relieved. We have not yet heard whether this suggestion has yet actually been availed of, and the pipe been tested in practice. The shoulder which occurs when the lower channel breaks back into the wider pipe is, no doubt, a slight drawback, but it seems to us that this might be modified as actual experience would show to be necessary, and any tendency for solid portions of sewage to accumulate and harden there might easily be corrected.

Mr. Plummer also, in March, 1894, read, before the Northern Architectural Association, an interesting paper on "Zinc and Zinc Roofing," in which he entered minutely and at length into his subject, and adduced some valuable information and notes. This paper was published in the building papers soon after, and is a useful contribution to a subject upon which too little attention is bestowed. Mr. Plummer compared zinc with lead in all their various aspects as roof coverings, and dwelt upon the merits and demerits of each and the place and manner in which zinc might fitly be used. He showed that zinc roofing might be regarded with much more confidence than was customary. Nor is this the only work of an educational character that Mr. Plummer has undertaken. He has been active in instituting and organising the students' classes at the Northern Architectural Association, and he has taken upon himself a share of the duties of delivering lectures to those classes. In connection with the Cambridge Extension Architectural Lectures he has also busied himself, on several occasions having conducted parties of students over churches and buildings of architectural value in the northern counties.

THE GLASGOW SCHOOL OF ART.

WE have received a copy of the prospectus of this institution for 1898-99, which discloses a most ambitious programme in Architectural classes. This section, which is under the direction of Mr. William J. Anderson, A.R.I.B.A., will embrace lectures on Building Construction (elementary, advanced and honours), Specifications and Quantities, Architectural Drawing and class-work, Sketching class, Measurement class, Principles of Ornament and Colour Decoration, Architectural Design, Historic Ornament, Perspective, and Sciography and Geometry. To this comprehensive list must be added a course of instruction on the Historic Development of Architecture, the special subjects being a history of the Renaissance in France, and a general history of Architecture. The curriculum has been arranged to meet the requirements of the R.I.B.A. examinations. There are other classes on Decorative Art subjects and Applied Art. As an instance of the good results accruing from these lectures, a list of appointments that have been secured by the students during the last session is given. The Glasgow School of Art also holds the proud position of first place in the National Competition Returns for 1898, with a total of thirty-one medals (two gold, nine silver, and twenty bronze). New Cross (London) comes next with twenty-six (two gold, eight silver, and sixteen bronze). It is strange to see such big cities as Manchester with only seven medals, Edinburgh with two, and Liverpool three. This is probably a greater triumph for Glasgow, and an instance of how diligently our friends over the border apply themselves to the study of Applied Art. Altogether, the future of the schools seems full of promise.

At a recent meeting of the Hampstead Vestry a memorial was received from the Hampstead Art Society, signed by several prominent artists, urging the erection of an Art Gallery as an addition to the Central Public Library in the Finchley Road. The matter was referred to the Public Libraries Committee.

HALL ROOF AT HAMPTON COURT.

MEDIAEVAL TIMBER ROOFS.*

By D. M'LEOD CRAIK.

OF the beauties which Mediæval Architecture presents to the architectural student there are few more striking than the open timber roofs which adorn so many churches and ancient halls, and testify to the constructional skill and artistic feeling displayed by the carpenters of that age.

The effect of these roofs, with their bold receding arches, massive, richly moulded and carved timbers, spandrels filled with intricate tracery, profusely ornamented cornices, and exquisitely carved bosses, must rivet the attention of every spectator, and must prove to the enthusiastic Goth a realisation of the most sublime beauty.

When we add to this the blaze of rich colouring of which nearly all the roofs bear traces, the result attained would be a degree of splendour which it is difficult to imagine in these days of sombreness and gloom, unenlivened by the least spark of brilliancy, although it must be admitted that this lack of colour is admirably suited to the lifeless and wearisome farce which goes by the name of present day religion.

There is an absence of open timber roofs during the early period of Gothic Architecture, which appears very unaccountable at first, because one would naturally suppose that as timber roofs of a necessity preceded stone vaulting, the most beautiful and elaborate forms of roofs would also occur prior to the magnificent examples of groined vaults, which still remain in all our cathedrals as monuments to the constructive skill and genius of the masons of the Gothic period.

But the reason for this deviation from the usual course of events is not far to seek, when we remember the serious fires which destroyed Canterbury, and other cathedrals about this time, and the builders finding that it was possible to use stone for roofing purposes, soon became so proficient in the use of this material that the mason seems to have excluded the carpenter almost altogether both from constructional and ornamental work.

The best and most numerous examples of timber roofs occur in the beautiful parish churches, scattered all over the country, and a few old palaces and halls, which still remain, relics of kingly and baronial magnificence. They are, as a rule, acutely pitched, although not invariably so. An angle of 90 degrees was the ordinary elevation of Norman roofs, the Early English generally acutely pointed, but rarely an equilateral triangle, or 60 degrees; in fact, in both the Decorated and this style

there are some so low as to rival the Perpendicular. For example, the Early English church at Warmington, and the decorated roof over the larger south aisle of St. Martin's Church, Leicester, has a span of 21ft., and a rise of only 4ft. In Norfolk and Suffolk there are many beautiful examples of high-pitched roofs.

The timber used was chiefly oak or chestnut, and the different parts were always mortised and tenoned together, and fixed with wooden pins, no iron ties, straps, or even nails being used in any part.

The scantlings were of stouter proportion than those in present use, and give a feeling of robustness and security to the roof, as well as providing an insurance against the ravages of time, which seems to have left very little impression on the enduring oak, most of the damage being the result of neglect, or the ruthless vandalism of the Reformation in defacing and removing the carved work, which offended the pious susceptibilities of its adherents, though in this respect the roofs, owing to their inaccessibility, and the fear of consequences if the construction were meddled with, have fortunately come off lightly. But of course there was nothing to hinder the abundant use of that most effective weapon and safe cure in the hands of a fanatic or ignoramus, the whitewash brush.

In describing the construction of the roofs, I have divided them into the usual five varieties, namely:—Roofs with tie-beams; trussed-rafter or single-framed roofs; roofs framed with hammer-beams and braces; roofs constructed with collars and braces, or braces only; and aisle roofs. The four last are peculiar to England. As will be seen, they differ greatly from the forms of roofs in use to-day—king-post, queen-post, &c., &c. This is chiefly attributed to the shortness of the spans, about 15ft. to 20ft., 36ft. being a very wide instance; and to the desire to make the roof an ornamental feature, which it would be well for all architects to bear in mind when the opportunity occurs, because with modern scientific and constructional capabilities it cannot be said that the open timber roofs of this age excel those of mediæval times.

Tie-beam roofs occur in Norman, Early English, Decorated, and Perpendicular buildings. In the Norman they were the only description of roof in use, but, as before mentioned, very few examples remain, and these display very little either of beauty or construction. The tie-beam was sometimes used quite apart from its usual function of serving as a tie to the ends of the rafters; it was laid across from wall to wall, and pinned to the wall plates. Examples occur in Clymington Church, Sussex, and in the south chapel of Bredon Church, Worcestershire.

Some tie-beams are beautifully moulded, as in Southfleet Church, Kent, but others are left quite plain, for instance, the chancel, Northfleet, Kent, where they are in a state of

natural roughness, while the roof is panelled, and has moulded ribs with carved bosses.

Various methods were resorted to at different periods to make these beams harmonise with the general style of the Architecture, but at the best it was never a decided success.

In roofs of a low pitch, which occur at an early period, the beam was made to bear the whole weight of the roof, as in the one over the larger south aisle, St. Martin's Church, Leicester; in this instance it is supported by moulded curved braces, the whole forming an almost semi-circular arch, the crown of the arch being cut out of the solid beam, which is of enormous scantling. Some of the expedients employed to retain this arched form and the tie-beam in roofs of higher pitch result in very unsatisfactory effects; for instance, Morton Church, Lincolnshire, where the beam divides the arch into two, but there is a very fine example of an unbroken arch at Adderbury Church, Oxfordshire, where arched tie-beam braces span the nave, and foliated ridge braces each bay of the roof, springing from the tie-beams, and framed into the ridge, the timbers being all moulded and cusped.

A perfectly horizontal tie-beam is very rare, it is almost invariably cambered, as are also the collar-beams, and even hammer-beams incline slightly upwards. The effect of the straight line presented by the underside of the beam is counteracted by curved braces framed into it, and connecting it with the wall pieces.

A common variety of roof in Kent and Sussex, which excites admiration, consists of a tie-beam, with or without wall pieces, supported on corbels with curved braces to the underside of the beam. From the centre of the beam rises a king-post, sometimes octagonal, with cap and base, from its four sides spring curved braces, supporting the principals and ridge. In this case the king-post is put to a different use altogether from that which it possesses now, in so much as it is entirely supported by the tie-beam instead of the latter being suspended from it.

Examples occur at Swardstone Church, Norfolk; a disused church at Horton, Canterbury, and Penshurst. An instance of a rude but very secure roof is shown at North Walsham Church, Norfolk. The ties of the aisle roof pass through the walls, and form corbels for the wall pieces of the nave roof, intermediate trusses of double rafters are used, and the common rafters have collars.

Towards the end of the Perpendicular style tie-beam roofs of very low pitch occur, often with no more rise to throw off the rain than the camber of the beams provided. These roofs were profusely ornamented, as in the north chapel, Wellingborough Church, North Hants, where the eastern bay is panelled, the rest open rafters; there is another beautiful example at Rushden.

The tie-beam class of roof is more general,

* A paper read before the Edinburgh Architectural Society.

and better treated in France, where the use of high pitched roofs led to purlins being discarded, but the racking motion to which large roofs were liable owing to this, necessitated the employment of a kind of trussed partition under the ridge, as at Auxerre.

The king-post, A, stands upon the tie-beam, which rides in queen stirrups, B, which are hung from the principals at three-quarters of the height of the roof, the collar, D, is tenoned into the king-post and rafter, the brace, C, supports the collar, and with it the stirrup, B, and with them the tie-beam, E.

The framing of cradle roofs with king-posts carried upon tie-beams, became a general practice in France from the latter part of the twelfth century until the end of the sixteenth; the above method of construction being followed as at the Episcopal Palace, Auxerre.

Trussed rafter or cradle roofs were most probably chosen for the purpose of gaining head room, or because of the difficulty in roofing over vaulting, this form of roof avoiding the necessity and expense of raising the wall head to the level of the apex of the vault in order to introduce a tie-beam. Its superiority both constructionally and in point of beauty over the tie-beam necessarily led to its being preferred and generally used.

In roofs of wide span each pair of rafters had a collar, and braces sometimes crossing above the collar, and at others tenoned into its underside.

The roof of Ely Cathedral is a good example each pair of rafters is trussed, which gives the appearance of an arched ceiling, pentagonal in form; the two lower inclined sides being formed by the lower part of the rafters; the two next by braces running obliquely from one rafter to its opposite neighbour; and the upper side by the collar which intersects the braces; all the timbers are halved and pinned together with wooden pins.

The rafters generally extended to the outside of the walls, and formed the eaves, the walls being of great thickness, and never carried up higher than the wall plates, a large space was left between the wall head and the rafters on the inside of the church. Instead of placing the wall plate near the outer edge of the wall, where it would have been very insecure, the carpenters filled up the space with upright pieces of timber, called struts, flush with the line of the wall, and framed and pinned to the underside of the rafters, the foot being connected with the foot of each rafter by a horizontal piece of timber equal in length to the thickness of the wall, which was notched on to the wall plates, which were placed either centrally or at the inner and outer edges of the wall; this formed a triangle, which provided a wide footing for the truss, and obviated the danger of spreading. Purlins were discarded altogether in this style of roof. These roofs are frequently lined, and often lathed and plastered, although it is open to grave doubt whether their beauty was augmented by either process, certainly not by the latter.

The form of the arch was often perfected by the addition of curved braces to the underside

of the trusses, and the roof was generally formed into panels by ribs running horizontally, with carved bosses at the intersections.

The panels in Somersetshire are mostly plastered.

The trussed roof was a favourite style in the Early English and Decorated periods. It was necessarily of high pitch, as this, by diminishing the thrust on the walls, required neither a great footing nor large timbers, and is, perhaps, a more satisfactory reason than the climatic one for the use of steep roofs.

The tie-beam was retained for a long time, being inserted at intervals of twelve rafters, which were 1ft. 2in. to 1ft. 8in. centres. The internal wall plate was often moulded and ornamented as a cornice.

In the example given of the roof over the nave, Wimbotsham Church, Norfolk, the roof is boarded under the timbers, and divided into panels by small moulded ribs, with well carved bosses at the intersections, and is further ornamented by a small, embattled cornice, span 21ft. 9in.; scantlings, rafters, collars, &c., 4½in. by 4in., rafters 1ft. 9in. apart. It is thought to belong to the Decorated period.

The origin of hammer-beam roofs is often supposed to be that of the tie-beam which has been cut off, merely leaving the ends supported by braces, but the more likely theory is that derived from the mode of securing the feet of trussed rafters.

The similarity strikes one at the first glance; the connecting piece A B is lengthened, so as to project into the building, the strut A C, instead of being flush with the wall, is placed further out, and a brace is introduced underneath the hammer-beam to strengthen it and carry the weight of the roof lower down on to a wall-piece, which rests on a corbel in the usual manner, its head being tenoned into the under side of the beam. It is almost impossible for this kind of roof to spread, owing to the stiffening action of the braces, and it would require a very strong force to push out the walls.

The collar-beam is retained, but instead of cross timbers, thin curved braces are used connecting the collar, principals, and struts together, and into which they are tenoned, forming an arch which is not only important as binding the roof together, but greatly enhances its beauty.

(To be continued.)

VANISHING LONDON.

NOT long ago we duly chronicled the disappearance of an old Fleet Street landmark, the sign of the "Three Squirrels," where Messrs. Goslings and Sharpe's banking business was conducted. The big gap then left in Fleet Street will soon be filled up by the new building in which that ancient business, now merged in Messrs. Barclays', will be resumed, and the famous "Three Squirrels" will reappear in a new home. Now another landmark close by is to vanish. In the course of a few months "Butterworth's" and "Dick's Coffee House" will no more be among the institutions of Fleet Street. "Dick's," indeed, has practically been dead for a long time. The old house stands, still, behind Butterworth's, but its glories departed towards the middle of the present century. Then, in the fifties, it was still the resort of barristers and men of letters, and in it the old Fleet Street tavern life survived, if not in the full tide of the days of Ben Jonson, and Steele, and Dr. Johnson, at least in a green old age. Since then the narrow passage leading to the quaint old place has been less and less frequented, until, finally, the poor old coffee tavern wherein the mightiest wits of England foregathered for two centuries became a "café restaurant" under Italian management! And now even the foreigner has abandoned it; the passage is closed, and "Dick's" can only be seen from the back windows of Messrs. Butterworth's—one of the most picturesque survivals of old London now to be seen anywhere.

ST. MARY'S, WIMBOTSHAM.

NAVE OF ST. MARY'S CHURCH, WIMBOTSHAM, NORFOLK.

RUINS OF MEDIÆVAL ENGLAND.*

BY CHARLES HADFIELD.

THOUGH a craftsman myself, whose life has been spent in the study and practice of Architecture, I must own to having little to say that can throw new light on the venerable structures which thickly stud the hills, valleys, and plains of this realm of England—precious gems from the dower of Mary, an earnest of the love of olden days for God's dwelling place with men. I have no intention, even had I the time at disposal, to embark in an archæological essay on English Mediæval Architecture, but I propose to try and unfold to you somewhat of the spirit and methods of that wonderful period—of those halcyon days, when art inspired by religion filled men's minds with noble and lofty methods of procedure, enabling them to realise ideals rich in imagination and poetry that are still powerful influences on the masses in our own day. The puritan Milton, in his "Il Penseroso," well voiced this sentiment in his day:

But let my due feet never fail,
To walk the studious cloister's pale,
And love the high embowed roof,
With antique pillars massy proof,
And storied windows richly dight,
Casting a dim, religious light;
There let the pealing organ blow
To the full-voiced quire below,
In service high and anthems clear,
As may with sweetness thro' mine ear
Dissolve me into extasies,
And bring all Heaven before mine eyes.

It has been said by a distinguished writer that the history of a people may be read in its monuments. This, while true of the Egyptians, Greeks, Romans, and other nations of antiquity, is especially true of the monuments of Catholic England. They were the outcome of a faith that permeated the whole nation—clergy and people, in Christ's church and His Vicar, the Blessed Peter and his successors. All classes of the community, king and noble,

as well as the poorest peasant, vied in love, self-sacrifice and veneration for the cathedrals, churches, and monastic establishments of the land, and gave of their best to adorn and to enrich them. In the earlier centuries, but especially from the seventh to the close of the twelfth century, the great monasteries were the centres of art and technical training throughout Europe, the best schools for Architecture, sculpture, painting, and the decorative arts. Within their precincts groups of skilled craftsmen, monks and laymen, worked side by side under strict discipline, and young apprentices were taught. Art was thus popularised, and became matter of common interest. The Pointed or Gothic style of Architecture developed in France about the middle of the twelfth century, simultaneously

with the great popular movement known as the Enfranchisement of the Communes, which was a successful resistance on the part of the mercantile classes against the tyranny and exactions of the Feudal Lords. With the commencement of the thirteenth century

THE TRADE GUILDS,

under the guidance of the Church, took up the good work, and there is no doubt that the average craftsman then was, in consequence, far better equipped than the craftsman of to-day; when, I venture to submit, art and technical education throughout the British Empire (and, for that matter, in the United States) are, in spite of all the professions one hears, little better than a sham, and for all practical purposes of small avail to men whose lives and best energies are spent in ministering to the meannesses and exactions of a sordid and grasping commercialism, which seeks to crush out the individual, and to make the toiler a mere atom of a huge industrial machine. A distinguished Belgian priest, the Rev. L. J. Lalieu, D.D., parish priest of S. Nicholas, Mons, addressing a recent gathering of the Society of S. Vincent de Paul in Hainault, pointed out that in the middle ages the Church had almost solved the problem of pauperism by means of the old trade guilds and other corporate bodies, and he added "that the pauperism of to-day, which might be called the modern form of ancient slavery, owes its original source and primary cause to the attempt made to bring back society to pagan customs. Industrialism, and the introduction of machinery, heartless and without conscience, have driven the masses of the labouring population

INTO THE DEPTHS OF INDIGENCE.

We must positively get out of those swamps, which are infected with pagan egotism—for which the toiler is only a machine from which the owner draws the greatest amount of profit he can, with the least expense possible—and we must bend our steps energetically and prudently, courageously and gradually, in the direction of those brilliant heights of the Christian ideal which greets in the toiler, however humble he may be, a man and a brother who has a right, as a general rule, to derive from his work and toil the amount of money required to supply his own wants and those of his family." You cannot expect "to gather grapes from thorns or figs from thistles," and it is impossible for artistic culture to thrive in the conditions of poverty, dirt, and utter degradation as to surroundings, of the toiling populations in so many of our large manufacturing centres at the close of this nineteenth century. On this subject a fellow

* A Paper read before the Catholic Young Men's Societies of Great Britain at Sheffield last month, entitled "The Cathedrals, Churches, and Ruins of Mediæval England, as Witnesses to the Faith of our Fathers."

craftsman, W. R. Lethaby, who is doing yeoman service, "Ore et Manu," towards the popularising of art in London, writes to me: "I quite agree with what you say, but it is a part of a very big whole—the whole of modern England—and where we are

TO LOOK FOR AN IDEAL

to lay hold of the people I do not know. Nothing less than 'tidying up' of London and Sheffield, and all England, and an enthusiasm to get them once again, at least, clean, and bright, and decent—Can it be?" I have spoken of the popularity of art, and the large share of interest accorded to it by all classes during the days that England was Catholic. A glance at the fragmentary accounts which have come down to our time of the building of the cathedrals and parish churches, monasteries and colleges, with the inventories of their furniture and belongings, will convey the best idea of the share taken by the whole nation in the erection and embellishment of those monuments of piety and practical religion which were then the uppermost ideas in the everyday life of the people. Gervase, a monk of Canterbury, who was an eye witness of the martyrdom of S. Thomas à Becket, and of the great conflagration which destroyed the choir of the cathedral, soon after that event gives an interesting account of the rebuilding in a manuscript (Vespasian B. XIX. of the Cottonian MSS.) preserved in the British Museum, where I had the pleasure of perusing it some years ago. After a graphic description of the fire and the grief in which the monks were cast by the disaster, he details the steps taken for repairing the mischief, the arrangements for carrying on the services, raising money, &c. The manuscript covers a period of ten years from 1174 to 1184, when this portion of the cathedral was completed very much as we see it to-day. A French engineer, Master William, of Sens, who had been employed by the Archbishop of that see, a friend of S. Thomas, was employed by the monks, "and to him and to the Providence of God was the execution of the work committed." The destruction and survey of the damaged halls, and the rebuilding of the new work, are all described;

THE MAGNIFICENCE OF THE NEW

contrasted with the old, and at the end of the third year, by which date rapid progress had been made, the historian observes: "All those things appeared to us, and to all who saw them, incomparable, and most worthy of praise, and at so glorious a beginning we rejoiced and conceived good hopes of the end, and provided for the acceleration of the work with diligence and spirit." During the fourth year the master was injured by a collapse of the scaffolding, and, tenderly cared for by the community, directed the work from his sick bed, leaving the active supervision to a certain ingenious and industrious monk, who was foreman of the masons. He being a lay brother, and unpaid, was taken exception to by the wage-earning skilled craftsmen, but the friction was judiciously allayed by the master, who put all things in due order and every man in his place. Master William eventually gave up the work and returned to France, having been hopelessly crippled by the accident, and was succeeded by another master craftsman—"William by name, English by nation, small in body, but, in workmanship of many kinds, acute and honest." One of his first tasks appears to have been the preparation for the foundations of the chapel in which the shrine of the B. martyr was subsequently erected. The shrine of S. Thomas was one of the glories of Catholic England. Stow, the antiquary, says it was covered with plates of gold,

DAMASKED AND EMBOSSED WITH WIRES OF GOLD,

garnished with brooches, images, chains, precious stones, and great orient pearls, the riches of which shrine, at the spoilation in 1533, filled two great iron chests, each one a heavy load for six men. At Easter Eve, 1180, the monks took possession of the new choir before the eastern portions of the sacred building were completed.

(To be continued.)

The R.I.B.A. and the Government.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read Mr. A. R. Jemmett's letters upon this subject, addressed to you, and also your editorial comment.

I took considerable interest in this matter at the Institute, and on one occasion expressed the hope that a member of that body would be employed by the Government.

I find Mr. Jemmett stating—*inter alia*—in his letter, which appears in your issue of the 24th inst., thusly: "As the best men are not members [of the Institute], and as the Institute is aware of this fact, I see no escape from this conclusion myself."

I am a member of the Institute, and I hold an opinion the very reverse of Mr. Jemmett's, and if he will be good enough to name the gentlemen who are not members of the Institute (and their respective works), whom he considers to be the "best men," I shall be very glad to break a lance with him on a matter to which I have more than once referred at No. 9, Conduit Street.—I am, yours obediently,

WILLIAM WOODWARD.

13, Southampton Street, Strand,
August 24th, 1898.

THE NEW TECHNICAL SCHOOL AT BOOTLE.

LOCAL GOVERNMENT BOARD INQUIRY.

COLONEL W. R. SLACKE, R.E., an inspector of the Local Government Board, held an inquiry recently at the Town Hall concerning the application of the Bootle Town Council for sanction to borrow £15,351 for the erection of a technical school. The Town Clerk, at the outset, said that there was no opposition to the scheme. There were no other technical schools existing in the borough than that carried on under the Corporation. The site of the new technical school was purchased in 1897 with the sanction of the Local Government Board. The plot of land, which stood at the back of the Town Hall, was bought for three different purposes, and the portion allocated for the school comprised 3106 square yards. Accommodation would be provided for about double the number of students (including males and females) than there were at present. The plans of the building were selected on competition. Twenty-two sets were sent in, and Messrs. Best and Callon, Westminster, proved to be the successful architects. The sum fixed upon as the amount of expenditure to be incurred for buildings, fixtures, and furniture was £20,000, but the Council did not want to borrow the whole of that sum. The committee had in hand, or estimated they would have by the end of the year, £4649, and that amount deducted from £20,000 would leave a balance of £15,351 to be borrowed. The arrangements adopted for the heating, lighting, and ventilation of the building were in every respect most satisfactory.—At the close of the inquiry Colonel Slacke inspected the site of the school.

ST. GEORGE'S CHAPEL, Windsor Castle, which has been closed for nearly a fortnight for cleaning and repairs, has been reopened for Divine service.

Two blocks for infantry are to be built at Hounslow at a cost of about £12,000, besides two large mobilisation stores, estimated to cost about £4000. Only recently considerably over £6000 has been expended upon the drainage of the barracks there, besides other lesser sums on improvements, &c.

It is hoped to have the installation of electricity in the courtyard of Marlborough House completed before any members of the Prince of Wales's family resume residence. Workmen have commenced making the trenches for the main from which the arc lamps will obtain their supply.

THE NEW THEATRE AT BLACKPOOL.

AT a recent vacation sitting of the Chancery Court of Lancashire, the Deputy Vice-Chancellor, Mr. W. F. Taylor, had before him an application in connection with a new theatre which is being erected at Blackpool. The plaintiffs were Messrs. William Rhodes and Sons, and Messrs. Young and Rhodes, and they asked for an interim injunction restraining the defendants, the Alhambra (Blackpool) Limited, from erecting their theatre to such a height as to interfere with the plaintiffs' ancient lights.—Mr. Mansfield said the plaintiffs asked that the defendants be restrained from continuing the erection of the building further than what it was at the date of the writ. The plaintiffs were lessees of premises in Bank Hey Street, which was a very narrow thoroughfare. The defendants were erecting a new theatre called the Alhambra, and the back of the building ran into Bank Hey Street, opposite the shops occupied by the plaintiffs, who carried on business as drapers and silk mercers, and as ironmongers. Prior to the erection of the theatre the site was occupied by the Prince of Wales' Baths, and these only went to a height of about 44ft., but the new building had been already carried to a height of about 77ft., and interfered materially with the plaintiffs' lights. The plaintiffs could not interfere with the building so far as it had gone, but the defendants were increasing the height, and the theatre was apparently to go very much higher. Since the issue of the writ the defendants had gone on, and he thought they had even worked overtime.—Mr. Roby said the site on which the new theatre was being erected was cleared by the end of last year, and the defendant Company commenced the building in 1898 with a great flourish of trumpets and a prospectus issued to the public. It was known that it was going to be a very extensive and costly building, and although it had been proceeded with regularly up to the present time, there had been no complaint by any one of the plaintiffs.—Mr. Mansfield: Oh, yes, there is an affidavit stating that complaint was made.—Mr. Roby said the only possible object the plaintiffs could have in commencing this action the day after the beginning of the long vacation was to make the defendants come to terms with them at once, or otherwise an injunction might be granted which would prevent them putting the roof on, and thus save this costly building from being entirely destroyed. It seemed perfectly hopeless that this action could succeed.—The Deputy Vice-Chancellor said he would make an order that the motion stand over till the trial of the action. It was well known that the defendant Company were going to build a theatre on the site in question, and the building was commenced in January last. Some time in April, it was stated, complaint was made that the building was likely to damage the plaintiffs' ancient lights. He should have thought that the first thing people would have done when they did make a complaint would have been to examine the plans. If they had done so they would have seen exactly what was going to be done, and then was the time to take any proceedings if they thought fit to do so. It was clear that the trial of the action could not take place during the vacation, and a mandatory injunction could not be granted on an interlocutory application to compel them to pull down the building which was already up at the date of the writ. Therefore the only effect of issuing a writ on the first day of the vacation was to prevent anything being done until the sitting of the court in October or November. He did not intend to refuse the motion that day, as it would prejudice the plaintiffs in any future application. The proper course was to let the motion stand till the trial of the action, when everything would be open to both parties. Anything done between now and the trial would be done by the defendants at their own risk.

NEW WESLEYAN COLLEGE, SCARBOROUGH, YORKS. HALL, COOPER, AND DAVIS, ARCHITECTS. (See p. 55.)

HOUSE AT BRUSSELS: THE FIREPLACE UNDER THE STAIRS. M. H. BAILLIE-SCOTT, ARCHITECT. (See "Professional Items.")

BRADFORD PARISH CHURCH RESTORATION.

THE workmen employed upon the restoration of the Bradford Parish Church are continuing to work overtime, and, though the work is such as cannot safely be hurried, very good progress is being made. The gallery on the south of the church has now been completely demolished, and the piers which were sadly cut into to support the timbers of the gallery have been repaired and strengthened. The timbers for the roof of the north aisle are being got into position, and, during the five weeks which will elapse before the meeting of the Church Congress in Bradford, this aisle will be roofed in and the north transept will be completed. The fabric of this transept is already nearly finished. The south transept will not be proceeded with until after the Congress. The oak seating of the church will not be put back into place for these services, but the church will be seated with chairs hired for the occasion. The new choir stalls, which are to be presented to the church by Mr. F. C. Foster, of Queensbury, at a cost of about £300, are already nearly

WESLEYAN COLLEGE AT SCARBOROUGH.

THE foundation-stone has been laid of the Scarborough Wesleyan College, of which we give an illustration. The building, as described by the architects, Messrs. Hall, Cooper, and Davis, is to be constructed of Scarborough stone, faced with local red pressed bricks and stone dressings, the roofs being covered with red Ruabon tiles. The main entrance has a southern aspect, and the main roads to the college are planned from Filey Road and Jackson's Lane, with a back entrance from the north corner of Filey Road. Care has been taken to arrange the block so as to sever the master's house from the school and dormitories, and yet make the whole one building, the connecting link between the two being the kitchen. The arrangement of rooms on the south of the building

COMPRISE THE MAIN ENTRANCE,

with inquiry office and entrance hall. To the east of this is the master's common room and boarders' recreation and reading room, which is 29ft. by 17ft., and is fitted up with book

It is to be heated with hot water radiators, and the plans show two large open fireplaces at each end in addition. To the west and south are arranged three class-rooms, properly lighted, fitted with dual desks, heated with radiators and open fires, and arranged to accommodate ninety-six boys, in addition to which classes could be taught in the schoolroom and lecture hall. To the north and east of the schoolroom is arranged the day scholars' entrance with vestibule porch. The chemical laboratory is planned to accommodate twelve boys at practical work at the same time, and is to be fitted with the

LATEST CHEMICAL ARRANGEMENTS,

working tables, &c., in accordance with the regulations of the Science and Art Department. The lecture hall is to be fitted with desks, seats, and a demonstration table. To the west of the school arrangements are made for lavatories, clothes, drying room, and boarder's locker room, fitted with a separate locker for each boarder, and provided with a lobby entrance from the grounds, by which the boys can reach their lockers and drying-rooms after football and other sports without using the main entrance. The first floor is

WADHURST JUBILEE MEMORIAL HALL AND INSTITUTE. A. G. BOND, B.A., A.R.I.B.A., AND H. HEATHMAN, ARCHITECTS.

complete, but it is probable that these also will not be placed in the church until after the Congress. The chancel itself is eventually to be floored in coloured marbles, and the steps at the chancel arch and in front of the altar will be of marble. The chancel walls have been plastered to admit of painted decorations. The nature of both these works makes it desirable that they should be among the last completed, and the new choir stalls will probably not be placed in position till the work in the chancel is taken in hand as a whole. The pulpit is to be improved by the insertion at the angles of niches containing figures of saints. This work is estimated to cost £90. A new marble base, agreeing in character with the chancel flooring, will have to be provided. Arrangements have been made for the church to be temporarily lighted with electricity during the Congress services, but the permanent fittings for the electric lighting of the church will be erected subsequently. The vicar has received promises of four or five new windows of stained glass, and one of these is already in hand, the design representing four Northern Churchmen—SS. Columba, Aidan, Bede, and Wilfrid. The cost of the structural restoration of the church will exceed £7000. It has been definitely decided that the old organ, which was quite unworthy of its position, shall not be replaced.

shelves and specially arranged so that the pupils may have its advantages for night study in lieu of the schoolroom. To the west of the entrance is the secretary's office and board room, the latter being adaptable to other requirements, and master's study, which is carefully arranged in order that the master may have access to the school apart from his residence.

THE DINING HALL

is to the north of the principal staircase on the first floor, and is capable of dining one hundred scholars, the tables being arranged so that all the boys face the centre of the table. The plans show the room to have two spacious bay windows overlooking the sea. To the west of the dining hall is the servants' room, and adjoining is the kitchen and scullery. The servants' hall, china closet, &c., adjoin the kitchen. The master's house is at the south-west angle of the building, having a separate entrance, with convenient dining room and drawing room overlooking the south front, and adjoining the study. The schoolroom is entered from the main entrance corridor, which corridor runs the whole block of school buildings, and could be extended with

ANY FUTURE EXTENSION

of class-rooms. The schoolroom is 52ft. by 24ft., and is capable of assembling 200 boys.

reached right and left of the main staircase and

A SPACIOUS LANDING

is planned with head assistant-master's room overlooking it, to the right of which are the dormitories. Two dormitories have seventeen beds each, and one dormitory nine. Each dormitory is overlooked by an assistant-master from his bedroom. In the master's house there are five bedrooms, bathroom, &c., and the servants' bedrooms are immediately over the master's house, and completely cut off from the other part of the building. On the third floor is the nurses' bedroom, sick day ward and a sick night ward, specially

ISOLATING ANY SICKNESS

from the other rooms. Here also is an extensive boxroom fitted with box racks and connected with a lift from the main hall. The whole building is to be warmed by open fires and steam radiators under low pressure, and where it is possible the radiators are to be built into recesses in the outside walls, so that fresh air may pass through them before entering the room. Contracts to the amount of £7818 2s. 3d. have been accepted by the Company. These do not include heating, boundary fences, permanent fittings, playgrounds, &c., and it is expected that by the time the college is completed £10,000 will be spent.

WHITEHALL.

KING CHARLES II.—so the Marquis of Normanby told Evelyn—had once designed to buy up all King Street and rebuild it nobly. King Street, be it remembered, originally extended from Charing Cross to Palace Yard. The Merry Monarch's plans were not carried out; probably there was no money, for pretty Nell Gwynne, languishing Moll Davis, the imperious Duchess of Castlemaine, the baby-faced Duchess de Mazarine, and the rest of them had too many costly whims and fancies to leave much for architectural projects. Similarly Charles I. had intended to erect here a palace on a sumptuous scale, and Inigo Jones's magnificent plans for it are still extant; but nothing was actually done except the Banqueting Hall, which is yet standing. What these well-meaning monarchs intended to do has been in course of piecemeal progress ever since. The great Whitehall Fire of 1697 wiped out a large portion of the congeries of Royal apartments and offices, and caused the removal of the Court to St. James's or Kensington. William III. intended, like his predecessors, to rebuild on a grander scale, but this intention also came to nothing. A thoroughfare was cut through the Privy Garden, and Whitehall became "a common street," as Sir Roger de Coverley said when displaying to the Spectator the portrait of that ancestor of his who did such doughty deeds in the Tilt Yard, where the Paymaster-General's Office now stands. Dover House, Gwydir House, and Whitehall Gardens now occupy sites on the old Privy Garden. The common street that Sir Roger spoke so contemptuously of was, in fact, one of the most interesting thoroughfares in the world, and, at one time, one of the most picturesque. Two gates crossed it at the ends of the Privy Garden. That called Holbein's Gate stood near the Banqueting Hall, and is well shown in a print by Samuel Wale, one of our earliest Academicians, as well as in the more elaborate print by Vertue. Canaletto painted it in his view of Whitehall (now in the collection of the Duke of Richmond) just previous to its destruction in 1759. Not many yards off had stood another gate, less interesting architecturally, called the King's Street Gate, which was pulled down in 1723. Nothing remains of this, but two medallions from Holbein's Gate are still preserved at Hampton Court. Both these gates are shown in an earlier print, by Israel Souvestre, about 1650. By comparing this with the prints of Wale and Maurer, and others of the eighteenth century, we can form a clear idea of the great changes that had taken place in the course of a century. There was a third gate, called the Hall Gate, opposite the south end of King Street, giving entrance to Palace Yard. This street will soon be erased from the map of London; it has long been greatly curtailed and reduced to a mere by-way. Now the east side of what remained is almost all down; the west side is to follow. Parliament Street is to be widened, and on the cleared site new Government offices are to be built.

ROLLESTON CHURCH, Notts., has just been reopened after restoration. Mr. Hodgson Fowler was the architect.

MR. W. H. BIDLAKE, of Birmingham, is the architect for the new Church of St. Agatha, Sparkbrook, Worcestershire. The estimated cost is £10,000.

THE scaffolding which surrounds the tower of the pro-cathedral in Church Street, Liverpool, has been completed, so far at least as the eye can discern. Let it be hoped that the artificers in the course of their work will, while adding to the stability of the structure, contrive to confer some degree of architectural grace upon it.

THE curfew tower bells at Windsor Castle, which are usually rung upon the Queen's birthday and other Royal anniversaries, have been re-arranged, and are now ready for pealing when necessary. The set has been silent for a time owing to an accident to the big tenor, and the discovery of a crack in the fifth bell, which had to be re-cast.

WORSTEAD CHURCH.

PROPOSED RESTORATION.

A FUND has been opened for the restoration of Worstead Church. Worstead Church is a fine example of the Ecclesiastical Architecture of the fourteenth and fifteenth centuries, and is well worth preserving. Sir Arthur Blomfield, who has presented plans for the restoration, reports that the work immediately necessary or desirable in the future may be divided into two main sections—first, structural works needed to put the whole building into a thorough state of repair, and, as far as possible, to arrest the progress of decay which is now going on with ever-increasing rapidity; secondly, to carry out works which will have for their object the permanent

IMPROVEMENT OF THE INTERIOR

of the building. In the first section, the first thing to be done is to put the roofs throughout into a thorough state of repair. Over the nave is a very good example of the hammer-beam roof of the date. It appears to have thrust out the side walls, especially the south one. There are no wall plates to this roof, rafters and principals resting directly on the walls; the ends of many of the timbers are rotten. The eaves are all more or less open, leaving free entrance for birds and bats, as well as for wind from all quarters. Under present circumstances it is impossible either to warm the church or to keep it free from the dirt and filth inseparable from the presence of birds and bats all over the building. The bells are badly hung in a frame too light for the purpose. They should be re-hung in a new frame of oak or iron. The south porch is

IN A RUINOUS STATE.

As to the tower, the newel staircase, the parapet, and battlements on the east, west, and south sides, and the south-west buttress—a portion of which has fallen—are in a ruinous and dangerous condition. The whole of the flint facing, originally beautifully executed, has long called for reparation and careful pointing to preserve it from much more rapid and extensive ruin. This work should no longer be delayed. The glazing of the windows, although to a large extent modern, is not at all satisfactory. When the building has been made structurally secure, and weather and wind proof, the consideration of the various items which belong to Section 2 may be properly undertaken. Nearly every trace of the ancient seats of the church has disappeared, the whole having been refitted with high pews of oak some time in the last century.

THE DISFIGUREMENT OF THE PROPORTIONS OF THE CHURCH

by the great height of the pews was enhanced by their being mounted on a wholly unnecessary step, thus completely spoiling the fine proportions of the nave. Nothing but an entire re-arrangement and lowering of the pews can remedy this defect. The floor of the church should by degrees be re-laid by good stone paving. The reredos and all the details of the modern stonework generally at the east end are of the most objectionable description, and rob that part of the church of all the simple impressiveness and dignity which it would have if unencumbered by such thoroughly bad work. Hitherto the church has not been warmed in any way during the winter months. It seems now a necessity to do so. With regard to the work as a whole, the best plan will be to take it in the order already given, and to complete one part first, in the best and most substantial manner before beginning another. The one exception to this general rule would be the improvement and brightening of the east end, which might be undertaken as soon as possible. It will require a sum of not less than £3000, says Sir Arthur Blomfield, to restore to the church some faint reflection of its former glories.

THE LATE LORD LEIGHTON'S HOUSE.

KENSINGTON is the goal of more than one artistic pilgrimage, though the pilgrims are usually natives of another country than ours. Until very lately many Americans used to travel there to visit the house of Mr. G. F. Watts, and during the past few months there have been many strangers to see the splendid collection of studies, drawings, and paintings which Lord Leighton left upon the walls of the house where so much of his great work was done. What is to become of this beautiful, informing, and valuable work? It may, perhaps, be dispersed among galleries and private collections—to be overlooked, or only seen by those who, besides the taste to appreciate it, have the knowledge where to look for it. On the other hand, the desirability of keeping it all in one place, of keeping it especially in the appropriate setting of the workshop where it was created, is so obvious as not to need enforcing. But Lord Leighton's house is as much one of his works as the frescoes in the South Kensington Museum. It was built to his designs; it has a suite of ideal studios; it is protected by a sufficient and pleasant garden; its floors are coloured with the tiles, its staircases and its walls are rich with the marbles and the paintings which appealed to his taste; it is in itself a record, a vivid memento of the artist. By what means then can the house and the sketches be preserved together for the public benefit. Shortly after Lord Leighton's death a committee was formed to induce the nation to buy the house and its pictures; but in the rush of a year when people were anticipating many calls on their purse in the way of subscriptions, the project fell through. Since then Lord Leighton's sisters, to whom the house was bequeathed, have, with distinguished munificence, presented the property to the representatives of the Lord Leighton committee. More than this (says the Daily Graphic), they have given many of the pictures which now adorn the house, and were followed in this generosity by the Prince of Wales and many other admirers, who have bought sketches and presented them to the house. But these evidences of private generosity are not sufficient. The house is not a freehold, but is held under a substantial ground rent; and lighting, water supply, repair and maintenance, rent and taxes—to say nothing of the provision of proper caretaking—represent a large and very appreciable annual expenditure. It is for Kensington first, and for the nation in general, to say whether it will subscribe a sum sufficient to maintain this unique museum of art for the benefit of the art-lover, the student, and the public generally.

THE Glasgow Corporation are considering a proposal to restrict the height of new buildings under their jurisdiction to 85ft.

THE City churches of St. Alphage, London Wall, St. Albans, Wood Street, and St. Andrew, Holborn, are now closed for repairs and cleaning.

AN inquiry was held recently at the Manchester Town Hall to consider the application of the Corporation for power to borrow £27,500 for the alteration and enlargement of Mosaic Hospital.

THE Gaiety Theatre, London, has been fitted with electric ventilators, which keep a current of cold air playing through the house all day, the result being that in the evening the temperature is desirably low.

RUSHTON Roman Catholic Church was on Monday afternoon re-opened by the Bishop of Shrewsbury, after restoration and renovation. The church is one of the most ancient in Cheshire, the original foundation dating back about 600 years.

THE foundation stone has been laid of a new mission room, which is to be erected for the locality of Halfway and Holbrook. The plans for the building were prepared by Mr. J. D. Webster, architect, of Sheffield, and the contract given to Messrs. Kirkby and Drabble.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

August 31st, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slabs; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Daily Chronicle has been recently calling attention to the unsatisfactory state of the Thames steamboats, which are inefficient, small, and greatly in need of paint and general cleaning. Attention might well be directed to the dirty little hovels which are designated "piers" by the Conservancy Board. These eyesores, are blots against the fair face of the Embankment. We have never been able to understand the absolute necessity of building these little huts upon a floating platform. It is needless to point out how much better the offices would have looked had they been erected on the high level, and in a style in keeping with the rest of the work. Recently, we notice, some improvements have been effected at Westminster Pier, but the general character of the thing is still the same.

THE New York correspondent of the Standard states that Mr. Charles Brush has made a preliminary announcement of the discovery of a new gas, a constituent of the atmosphere and absorbed in many instances. Its chief characteristics are low tension, and conductivity of heat surpassing those qualities in hydrogen one hundred times when impure, and, theoretically, a thousand times if pure. The discovery resulted from a search for secluded hydrogen. Mr. Brush calls his new gas Etherion. He thinks it analysable into several gases, forming a periodic group of new elements.

By way of commemorating the Knightsbridge Exhibition of International Art, which has recently closed, an illustrated souvenir catalogue of the show will shortly be issued by Messrs. Carl Hentschel and Co. It is to be a work of some importance, with over a hundred reproductions of the principal works in painting and sculpture which were gathered in the gallery. Among the artists represented in the souvenir will be Messrs. Whistler, Lavery, J. W. Alexander, Clausen, Puvis de Chavannes, Degas, C. W. Furse, J. Guthrie, T. Stirling Lee, Manet, J. Maris, Rodin, Segantini, J. J. Shannon, Fitz Thaulow, and E. A. Walton.

THE serious sea encroachments which have been reported from Deal and Walton-on-the-Naze during the last few days have revived the discussion as to obtaining Parliamentary aid in the protection of the foreshore at vulnerable points on the east coast. When the subject was raised last autumn, on Mr. R. F. Grantham's paper before the Society of Engineers, there was a general consensus of opinion that some steps ought to be taken for protection by the system of either embankment, groine, or upright wall. Holland is sufficiently protected by the first method, but it is doubtful if the same plan would answer here. Yet it might be tested on a small scale at some exposed part of the country, such as Lincolnshire or Yorkshire. The front slopes should not be made at too acute an angle, and,

as in Holland, should be protected by fagotting or by stone. The utility of groines is beyond dispute, and there are probably few points of the coast where well-constructed groines would not be found to give all the protection needed. The sea-wall is, of course, an excellent protection if properly constructed, but it is often built either upright or with a very high slope that in a heavy sea the waves undermine the base of the wall. Even a well-built wall is much protected if a groine is placed near, as it arrests and retains the shingle, which is of itself a great protection. Any one of these systems is too great an expense for a local authority to bear unassisted. The difficulty is how to adjust the cost between local and national interests and between the owners of frontages and those immediately in the rear.

IN view of the alarm which has doubtless been created in some quarters, it may be interesting to note that the sea gives something although it takes so much. There are parts of Lincolnshire where the frontage is some miles further seawards than in historic times. Much land, too, has been reclaimed. Mr. H. Wheeler, one of the best authorities on the fens of Lincolnshire, says that "some five hundred thousand acres are below the level of spring tides, and only protected from inundation by artificial earthen embankments." In the neighbourhood of Long Sutton there is much reclaimed land, and the Wash, it is well known, at one time extended from the North Sea to Ely and Cambridge on the south, and on the west over the low-lying country now called the Fens, and so up to Lincoln. It is said to have been six times as large as it is. These are facts which should be a stimulus to the undertaking of protective works.

RICHMOND people are much concerned at the announcement that Glover's Island, which lies in the middle of the Thames, opposite Petersham Meadows, and in the foreground of the celebrated view from Richmond Hill, is about to be offered for sale by auction. For many years the island has been used for storing boats, but the auctioneer's advertisement states that it would afford "a splendid site for the erection of a first-class club or hotel." The dismay of the inhabitants has been intensified by the owner having declared his intention, should the island not be purchased for building purposes, to permit it to be used as a huge advertising station.

A CORRESPONDENT of the City Press thus writes concerning the proposal to pull down the old house in Leicester Square, once the residence of Sir Joshua Reynolds: "Once again, because a house in which Sir Joshua Reynolds once lived is to be pulled down, the sentimentalist is on the trail bewailing the degeneracy of the Londoner and the apathy of the Government because they do not dip into their pockets to preserve what are, as a rule, ugly structures. Take Sir Joshua's house. What is there either outside or inside that should cause it to be preserved? It has no beauty. It may have been considered handsome in its day, but that day is long since past. Its retention would add nothing to the artist's reputation. He has his statue in the nation's great cathedral. His memory is perpetuated there. His genius is seen on the walls of our National Gallery, and few care a button where he lived. These mawkish mournings over dead men's houses are sickening, and remind one more than anything of the superstitious fetish worship of the barbarian."

THERE are other famous houses in Leicester Square besides that of Sir Joshua Reynolds. John Hunter, by far the greatest anatomist of his day, lived at No. 28, next door to the Alhambra. He was one of those fearsome men who used—in the days of what Matthew Arnold was wont to call Mrs. Gooch's gospel—to be held up before ambitious youths as a shining example of industry. Hogarth's house was on the site of what is now No. 30. Afterwards it was occupied by Kosciusko, the Polish patriot and exile, and later still by the

Countess Guiccioli—Byron's Countess—when ever she visited London. From 1720 to 1725 Sir Isaac Newton lived at No. 35. There is another of Newton's houses in St. Martin's Street, hard by. It is in a deplorably bad condition now. His last residence was Bullingham House, Pitt Street, close to Sir Richard Webster's house at Campden Hill.

It is odd how little the dwellers in picturesque country districts appreciate the commercial value of charming scenery. If they really understood how much of their prosperity depends upon the attractiveness of the locality in which they live, we might hear less of the schemes for running railways through well-known beauty spots. Such a line as that projected at Lynmouth, or as that more recently planned to disfigure the Pass of Aberglaslyn, in North Wales, would in all probability prove a most expensive convenience to the district opened up. The better class of tourist, who is a source of considerable income to the country folk, is by no means ready to revisit a place which can only show the bare remnants of its former beauty, and prefers to betake himself abroad, or to more remote parts in search of satisfaction for his æsthetic instincts; and in his place there comes the horde of cheap trippers for whom the new railway, in its own interests, especially caters.

In some respects the havoc which would be wrought by this projected railway in North Wales would be greater than that with which Lynmouth is threatened. The line would actually run through a considerable part of the Pass, and would enter it at what is perhaps the most picturesque part. The professed object of the promoters is to develop certain slate quarries, so that the line would do double harm by its own unpicturesqueness en route and by encouraging a horrible disfigurement at Beddgelert where the slate is to be dug out. Happily, the scheme is exciting vigorous opposition, but lovers of North Wales will have to bestir themselves if the district is to be saved from destruction.

THE majority of the members of the Finance and Estate Committee of the Liverpool Corporation have recently thrown cold water on the new south library scheme. The sub-committee charged with the arrangements for the erection of the building courteously approached the money-lending committee with the request that it should erect the new library at the corner of Windsor Street and Upper Parliament Street, the Library Committee paying 3½ per cent. interest per annum on the outlay, as had already been done in connection with the Kensington establishment. The financiers, however, rejected the request by seven votes to two. The increase in the number of readers at the existing branches in other parts of the city makes the building absolutely necessary. Besides, there are new features being introduced which make it still more imperative that greater room should be immediately provided.

A most interesting old timepiece is the clock standing in William the Fourth's bedroom at Hampton Court, and which Messrs. Gaydon and Sons, of Kingston, were recently commissioned to repair. The clock was made by Dan Quare about the year 1660, and is one of the most remarkable pieces of automatic mechanism in existence. It is what is commonly known as a "grandfather's clock," standing in a very tall oak case, with heavy ormolu mounts. There are several particulars in which this clock is almost, if not quite unique. In the first place it goes for twelve months at a time without winding. But more remarkable than this is its ingenious mechanism. It is what is known as a "calendar" clock, and besides recording the days of the month and the months of the year, it also automatically shows the time of sunrise and sunset. The last time the clock was overhauled was early in the present century. For the last forty years, however, the clock has not been wound up. It speaks well for the splendid workmanship of our ancestors that, with slight exceptions, Messrs. Gaydon found

the works in as perfect a condition as when the clock was originally made, and there is no reason why it should not last for another 200 years.

SOME consternation has been caused at New York by a rumour that the safety of the Brooklyn Bridge is imperilled by the tremendously increased strain that it has had to bear since the trolley cars have been permitted to cross it. A careful examination shows that owing to the buckling of a steel truss, the bridge has sagged sufficiently to justify some anxiety. The accident has caused the huge structure to groan and vibrate unpleasantly, but it is believed that there is no actual danger.

CONSIDERABLE advance has been made with the movement for building a permanent Art gallery in Whitechapel. A donation of £5000 has been made to the building fund by Mr. Passmore Edwards, and only £2000 more is needed to provide an adequate gallery. The Charity Commissioners would undertake the control of the place, and would arrange periodical loan exhibitions of modern pictures, and of work in various branches of applied Art. Canon Barnett, who has successfully organised the annual Art exhibitions in St. Jude's Schools, is one of the most active promoters of the scheme, which seems to deserve all success.

FROM Paris comes the news that the Cernuschi Museum, with its wonderful display of Oriental objects, is to be opened in October. This collection, which was formed by M. Henri Cernuschi during his travels in China and Japan, includes several thousand examples, and is one of the most complete representations in the world of the Art of these countries. It was lately bequeathed to the French nation, together with the house in which it is arranged. Among recent additions to the Louvre are a series of plaster casts and terra-cotta sketches by Carpeaux, a bust of a young girl by Houdon, and a collection of statues in wood and stone belonging to the early years of the sixteenth century.

THE halls in connection with Cherryfield Mission, Dundee, have just undergone a complete overhaul, while a substantial addition has been made to the accommodation by the taking in of a property to the north. Cherryfield Mission is one of the oldest established in the city, and is very popular in the district in which it is situated. Recently it was found necessary to extend the buildings, and with this object the directors purchased the property referred to. Tradesmen have been busily engaged for several weeks, and the result of their operations is that the suite of halls will now rank as perhaps the best equipped of their kind in Dundee. The main hall as reconstructed will be capable of seating comfortably 400 persons; and a smaller hall and class and ante-rooms have been fitted up in a very complete manner. A feature of the decorations in the large hall is a beautiful picture by Mr. J. M. Pratt, of Glasgow, representing Christ and the woman of Samaria at the well. This picture occupies the whole of the further end of the hall between the windows, and is a striking work of Art. The outside of the mission buildings has been renewed, and the entire premises present a very attractive appearance.

THE great hall of the Merchant Venturers' Training College at Bristol is never more worthily employed than when used for the purpose of an exhibition of work in different branches. A large number of specimens sent in have been on view for the inspection of visitors during the last week. The departments include designing and modelling, machine drawing, metal working, plumbing, carpentry and joinery, boot and shoe manufacture, and painters' and decorators' efforts. To plumbers' work great attention has been paid, and it is well to know that in sanitary appliances a great many students have made satisfactory progress, lead bends, jointing, bossing, and other details being satisfactorily

exemplified. Carpentry and joinery are illustrated by double-hung sash and frame, a teak case containing specimens of timber and other exhibits, arranged on the platform in the hall. Of designs in painters' and decorators' work, a sign, with the word "College," in ornamental characters, affords a creditable feature in lettering in colour. The collection of appliances in metal working evinces ingenuity and aptitude; and a one-horse power launch engine and pumps, machine vice for milling machine, lifting jack, and drilling machine vice, may be referred to as excellent specimens. Some carefully executed examples of machine drawing also deserve attention. The exhibition is altogether so eloquent of the thoroughness of technical instruction at the college that Bristolians may well regard the different classes of work with considerable interest.

AN interesting discovery has just been made on the banks of the Clyde at a spot between Dumbarton Rock and Dunglass. Through the efforts chiefly of Mr. Donnelly, artist, at Bowling, what is supposed to be a lake dwelling, or "crannog," has been found there. It is thought that the remains belong to the same period as the occupation of the neighbouring hill fort of Dunbine, discovered a couple of years ago, and regarded by archaeological experts as among the most valuable finds of recent years. The officials of the Helensburgh Antiquarian Society, who carried through the Dunbine excavations so creditably and so successfully, have undertaken to make a thorough investigation of the supposed "crannog."

AT a special meeting of the Berwick Town Council, the Town Clerk stated that a Government inquiry would be held to consider the proposed loan of £8000 for a new police station, the plans for which are in the hands of a Newcastle firm. A reply to the Council's request for railway station accommodation stated that the directors of the North British Company would carefully consider the subject, Mr. Conacher having visited Berwick.

THE Black Swan, Holborn, is famous among City signs. It has recently been partly demolished and reconstructed by the present owners of the distillery. The old house, fronting Holborn and backing on to Barnard's Inn, possesses title-deeds which go back to the time of James I. Down almost to the date of the Gordon riots it was used as a hostelry and coaching-house. The Mr. Langdale who figures as the jolly owner in Dickens's story turned the place into a distillery, which character it has retained down to the present day.

THROUGHOUT the world there are hundreds of lighthouses dotted along the coast, but a lighthouse in the midst of a cemetery is a rare thing. Such an one, however, has just been erected in the cemetery at Ulverston, Lancashire. The structure, which is 23ft. in height, with a spreading base 25ft. in circumference, and 8ft. in diameter, is constructed of white Carrara marble. The tower proper bears a striking resemblance to Sir John Barrow's monument on the Hill of Hoad, which, again, is like the Eddystone lighthouse. It is surmounted with a small dome and ball, supported on four pillars, and between these is a chamber, ornamented with a moulded cornice, and containing the radiating lantern. The light is forty candle-power, and the lamp has a burning capacity of about 13ft. of gas per hour. On the fine "die block" immediately beneath the entrance door is cut in bold relief a large and beautifully carved anchor, bearing across it the words, "An Anchor for the Hope of Sorrow through all Time." The chain finishes with a broken link, the other end being buried in the rock. The whole of the base of the lighthouse is skilfully carved to represent waves breaking against the rocks, and a coping covered with sea-sand is going to be erected around this, in order to give the whole a thoroughly realistic appearance.

SLOWLY but surely the old Leeds Grammar

School is disappearing to make room for the widening of North Street. The porch and belfry are practically all that remain in position, and they, too, will be razed to the ground. What the ultimate destination of the building will be is not known even to the gentlemen whose interest in the preservation of the historic edifice prompted them to purchase it. As the disintegration of the fabric gradually proceeds, however, every stone is being carefully removed and stored away in the hope of re-erection on some convenient site, much on the same principle as that which governed the demolition and reconstruction of Temple Bar many years ago. Two or three proposals have already been made, one being to utilise the material in building "head-quarters" for the Leeds Boys' Brigade—if only a suitable site can be found—and another to set it up as a mission church for Buslingthorpe. Yet another proposition would let the old school occupy a position on one of the several open spaces which the trustees of Wade's Charity are providing in different parts of the city.

THE work of constructing the tunnel through the Simplon has just been inaugurated both on the Italian and Swiss sides. It will be the longest in the world, and one of the most important, as it will put the Mediterranean (through the port of Genoa) in direct communication with West and Central Switzerland and with Central Europe. It is likely to be a great rival of the Mont Cenis and St. Gothard routes. The Simplon tunnel will be 12½ miles long, while the Mont Cenis is only about eight miles, and the St. Gothard a little over nine. The opening of the tunnel on the Swiss side will be near Brigue, at 680 metres above the level of the sea, and on the Italian side, near Iselle, at 750 metres above datum. This great engineering feat will, in reality, consist of tunnels, one for the railway and one for ventilation, connected by galleries. The work is being conducted at the expense of the Italian and Swiss Governments, and will cost about £3,000,000. It will take nearly five and a half years to complete. The hydraulic power for this gigantic undertaking will be obtained on the Swiss side from the Rhone, which will supply from 1180 to 2360 horse-power, and on the Italian side from the Cairasca river, which will give 2260 horse-power. The hygienic precautions for the benefit of the great number of working men to be employed are practically perfect. Each man, before being engaged, will be required to "pass the doctor," and there will be periodical examinations to ensure that no one is suffering from contagious disease. The huts of the employés will also be carefully inspected with a view to their proper sanitation. Each workman will wear a special dress in working hours, after which he will be obliged to take a bath. Thus, it is hoped, that the perfect health of the operating staff will be secured.

THE exquisite tapestry in the Queen's Gallery at Hampton Court Palace has just been cleaned and renovated under the supervision of Mr. Brown, curator at the palace. The tapestry was discovered by a lucky accident more than thirty years ago by the present superintendent, Mr. W. H. Pleasants. A picture having been removed, a defect in the woodwork behind made it apparent that some material was hidden at the back. Mr. Pleasants reported his suspicions to the late Lord Mount Temple, who at once sent word that he would make an inspection of the spot. His lordship ordered some of the woodwork to be removed, when the tapestry, which now adorns the walls of the Queen's Gallery, was discovered, and although dust and cobwebs abounded, and a regiment of the huge and notable Hampton Court spiders marched forth, the material was found to be in good condition, and after being brushed looked quite fresh. It is surmised that it was covered in by Queen Caroline in 1735, for in "Hervey's Memoirs" it is stated that her Majesty was very fond of pictures, and hung the walls of the palace with a number which she brought from Kensington Palace.

ARCHÆOLOGISTS AFIELD.

V.—IN EAST ANGLIA.

AN excursion of members of the Norfolk and Norwich Archaeological Society took place a few days ago, when North Elmham, Brisley, Gressenhall, Scarning, East Dereham, and Elsing were visited.

NORTH ELMHAM CHURCH.

North Elmham is a source of inexhaustible interest to the antiquarian. The church, dedicated to the Virgin Mary, is a handsome structure of mixed Architecture, comprising nave with aisles and clerestory, south and west porches, transept chapels, chancel and square west tower. The Rev. A. G. Legge, in the course of a most interesting paper, said: Everyone must be agreed that North Elmham Church is a most magnificent building. As one stands upon the top of the steps leading down into the nave its full glories seems to burst upon the eye. What a height, what a length, what a breadth. For years I have studied it, admired it, gloried in it. Those steps with their downward descent into the church are, I believe, unique—at least, I have never, so far as I can remember, seen anything of the kind in any churches into which I have entered.

THE MASSIVE OAKEN SCREEN

which shuts in the tower from the nave was the handiwork of one Francis Fluid, or Floyd, parish clerk. By an entry in the churchwardens' accounts he is paid 20s. in 1623 "for his work about the partition between the steeple and the church," and in 1625 a further sum of 10s. for "working the frame between the church and the steeple." Just inside the tower are three Early English miserere seats, originally belonging to the chancel. As they were too dilapidated to admit of repairs, the late Mr. Phipson, of Norwich, the architect who presided over the restoration of 1882, was good enough to have them copied for me for use in the choir. Passing into the nave, the door to the south is Early English, with a plain decorated porch. On the outer side of the north door, which is of the same date, is

A SINGULAR COBBEL TABLE,

supporting a horizontal projection. The late Mr. Carthew expressed himself as puzzled by it. It is composed of ornamental stones from another building, and I have no doubt myself that the fragments originally came from Walsingham Abbey, whence, as the early churchwardens' account book states, stones were conveyed for the repairs of the church. All lovers of the beautiful will have their attention specially drawn to the exquisitely carved bench ends in the nave. They date, I believe, from the thirteenth century. On one or other of them is represented a dog of a species which I have been informed is now extinct. I cannot quite call him a pre-historic dog, but since he was carved here he has left the haunts of man for ever. On a bench end abutting on the south aisle at the upper end is a head attired in a Roman helmet. The Elmham tradition is that it represents the head of Pontius Pilate. At the restoration of 1882 unsightly pews were removed from the upper end of the nave and aisles, and replaced by the

MODERN CARVED BENCHES

wrought by Messrs. Cornish and Gaymer, of North Walsham, and I think you will agree are no mean companions to the older ones. The choir stalls, benches, and screen were added at the same period, and I would especially draw your attention to the carving, which will bear a very close inspection. I mentioned just now Francis Floyd, parish clerk, in connection with the lower screen. Let me tell you that that was perhaps the least of the works which he wrought in the church. He was a man of some consideration and of no little ability. Besides his church work, he repaired all the bridges in the parish—several in number, as you cannot leave Elmham, north, south, east, or west, unless you pass over one of them. A note in the Register Book says he "began to be clarke ye 24 of June, 1605." He

held his office for forty-six years, and, if remarkable in his lifetime, he certainly was as remarkable in his death, for the Register Book further accounts that he was "four score & tooe years of age"—not the day he died, but "the day he was buried." The beautiful Jacobean pulpit from which I am now reading was his handiwork. An exquisite piece of it, originally supporting a sounding-board, forms the door of a cupboard in the vestry, and has cut upon it, "Francis Floyd, me fecit, A.D. 1626." In the churchwardens' accounts of 1614 is the following entry:—"It paid to Francis fluid for making ye pulpit xxs." I conceive that this alludes to the pulpit in plain form, uncarved, as in 1626 he is again paid for "finishinge ye pulpit iijli. iij. s. iij. d." The labour, therefore, of carving it would appear to have taken him twelve years. It has had its vicissitudes. In 1851 a so-called restoration, or, in other words, an abominable desecration, took place. Purbeck marble columns were wrenched from the sedilia, the altar rails were lowered, the font had its base and steps removed, being reduced to its present mean level, the remains of

THE ROOD STAIRCASE AT THE WEST END

of the chapel which now forms the vestry were removed, and this beautiful pulpit was pronounced to be rotten, and turned out. The late Mr. Barlow of Toftrees happily rescued it and set it up in his own church. In 1882 he magnanimously returned it. A few repairs had to be done, but so far from being rotten, the workmen assured me that they broke their tools over it. On the front you will note the very appropriate motto, "Verbum Dei manet in eternum." According to the late Mr. Carthew these were the words originally cut upon it, and as they had disappeared I had them renewed. Nor does the pulpit exhaust the works carried out by Francis Floyd. Let me ask you to cast your eye upon the altar table. He made it. It is finely carved with grapes and vine leaves, having in the centre "Vera Vitis Xts," and the date 1622, in which year the churchwardens pay him for making the Communion Table, for "goold (and cullers), and for other things, as appears by his bill, xxxiijs." In 1624 he journeyed to Lynn in order to see a free mason about a new font, which cost the church fund 1xs. I think this can only allude to the upper part, as the shaft is of the Decorated period. It arrived from Lynn in 1625, and in the following year he is paid iij. iij. d. for "leaddinge" it, and xiiij. d. for "hewing the marble" forming the base. If

THE PULPIT HAD ITS VICISSITUDES,

certainly and even more so had the rood-screen. Sawn asunder in obedience to the injunctions of Elizabeth, and hacked about by the Puritanic frenzy of the Commonwealth, what little of it remained in situ was banished to out-of-the-way parts of the church. Portions of it were discovered in 1851, face downwards, flooring some of the pews. In 1882 the relics were gathered together and placed in their present original position. Enough remained to show how exquisitely beautiful it must have been in the days of its glorious prime, when, no doubt, it extended from north to south of the church. It contains sixteen panels altogether, eight of them representing male, and eight female figures of saints. The painting and carved work will repay inspection. Standing, as the church does, upon the highest ground in the parish, it becomes an attractive object to the eye from a considerable distance, though the great length of the nave, 173ft., with a breadth of 43ft., including both side aisles, tends rather to dwarf the height of the tower, which rises some 80ft. "This," to take Mr. Carthew's account, "is in four stages, each of smaller dimensions than its inferior, the lower portion of each set-off having a moulded string. It is flanked to the top of the third stage by

DUPLICATED BUTTRESSES

in corresponding stages, with pedimental set-off obtusely angled, decreasing upwards, and terminating in triangular heads, with trefoils at the apex. The parapet is four-embattled, with an arcaded panelling over a string course, the under part of which is hollowed and ornamented with roses. It has corner

pinnacles with octagon panelled bases. Within the projection formed by the west buttresses of the lower stages has been formed a galilee porch, which has a two-centred arch, with a hollow moulding, enriched with roses, trefoils, &c., and gargoyles on either side." He has omitted to mention that at the apex of the porch internally are some mutilated figures, which, as the church is dedicated to St. Mary, may have represented the Annunciation. Over the porch externally, and guarded on either side by the aforesaid huge gargoyles, are three pedestals which once, no doubt, supported images of the Saviour, St. Mary, and St. John. The tower is surmounted by an extinguisher-like spire—a modern addition which had been better omitted. The dimensions of the chancel are about 42ft. 3in. by 18ft. 7in., and the thickness of the walls is 2ft. 8in. Here

NORMAN TRANSITION WORK

on each side of the chancel screens points to the oldest part of the church. History records that Herbert de Losinga, the friend of Rufus, and the renowned founder of Norwich Cathedral, smitten in conscience for certain simoniacal actions of which he had been guilty, sought absolution of the Pope in 1093, and by way of penance was directed to build five churches. One of these is said to have been at Elmham. I think it not unlikely that he built the chancel of this church. The east window was inserted in 1851, and took the place of an Early English one with three lights. It is a copy of a good window, but, from its dwarfed appearance, totally unsuited to its present position. After the chancel there followed, in due course, the nave. It is lofty, in six bays, the arches being supported by Early English pillars, alternately round and octagon. The next period of addition was the north and south aisles, and the chapel dedicated to St. John, where the organ now stands, in the Decorated style. For what cause the uniformity of the windows in the south aisle has been sacrificed by the insertion of a Perpendicular one, can only afford food for conjecture. Perhaps the original one had fallen into decay when the new architectural period came into vogue; or, possibly, some individual at that day, not over-provided with the gift of modesty, desired to have a large and conspicuous window for memorial purposes. It has, perhaps, one advantage, and one only. We are assured of its date; whereas, had a new Decorated window taken the place of the old, we might have found some difficulty in deciding at this distance of time. We might have been led to believe that it was of the same date as the others. Some of the windows in the aisles contain

REMNANTS OF ANCIENT STAINED GLASS,

and there may be seen that rich ruby colour which later ages have failed to imitate. In the Perpendicular period which followed a great work was undertaken. The roof was raised (the string course of the original roof is apparent at the west end), the clerestory was added, the chancel arch was rebuilt, and a three-light window, also containing ancient glass, was inserted over it. At the same time the chapel on the south side of the choir, dedicated to St. James, was built. As the original priest's door now became the means of entrance into the chapel, another had to take its place. This you will observe a little to the east of the chapel door. It is of singular shape, being cut diagonally across the angle formed by the south wall of the chancel and the east wall of the chapel. Close under the roof, and looking into the chapel, is a small, round-headed Norman window, broadly splayed inwards, and near to it on the east side are traces of another. By the building of the chapel, which obscured these windows, they became purposeless for light. More light, therefore, had to be provided, and this was done by piercing a Perpendicular window over the sedilia.

THE SEDILIA AND DOUBLE PISCINA

are original, and are good, bold specimens. The last, though by no means the least, work at this period was the tower, which I have already described. It contains eight beautiful bells, the tenor weighing a little under a ton.

The first, second, third, and fourth are marked with the name of the founder, Joseph Mallows, 1757; the fifth and sixth with the name of Thomas Mears, 1819 and 1815. On the sixth is this distich: "We rise like larks, sing as we fly, with notes that seem to reach the sky, 1767." On the seventh, "The hills, the vales, the towns all round, shall echo with a pleasant sound, 1757." In the interior on each side of the tower two boards will be noticed, the one containing the names of the bishops of Dunwich, and the other the names of the bishops of Elmham. At what date they were placed there I have never been able to discover. Shortly after the restoration of 1882 an enthusiastic visitor to the church recorded in a local paper the impressions left on his mind by his visit. He said that on entering the church his only feeling was "one of unfeigned admiration. Everything has been done that pride and affection could do for a lovely church."

NORTH ELMHAM CASTLE.

The party then inspected the ruins of North Elmham Castle, where Mr. Legge was again the cicerone. He said: The history of the parish goes back very far. It was a Roman station, and a Roman flamen is said to have had his residence here. Here, also, where we are standing is a Roman camp, and about a mile or more hence a Roman burial ground was discovered many years ago in a field called Broom Close, on the road to Dereham, on the right hand side by the white bridge which separates the parish from Beetly, and bears the name of Sponge Bridge. Elmham was one of the East Anglian sees as early as 673. We are standing upon the site of the Manor of Nowers or Novers, which derives its name from Milo de Noiers, who held it about 1180. He was a descendant of William de Noiers, a great favourite of William the Conqueror. The first thought, I think, which will strike one as to this castle is its small size; so small, indeed, that doubts have often arisen in my mind as to whether it might not after all be only the keep of a larger building, and these doubts were somewhat strengthened by the fact that when I was making a tennis court on the encampment the workmen came upon traces of walls. It is not only small in extent, but small also as to the several rooms or partitions into which it is divided. As to its age we seem to be

IN THE LAND OF CONJECTURE

and assertion. Looking at the outside walls I think you might assert any date you pleased, and there would be little danger of contradiction. Mr. Carthew was of opinion that it was the residence of the early Bishops of Elmham. For myself, and so far as my opinion is worth anything, I believe it to be of Roman origin. Several Roman tiles are to be met with inserted in the walls, though it is certainly possible that these may have been utilized at a later date, and in the angle of one of the towers I dug up a portion of a Roman lamp. I have unearthed human bones to any amount, and from the fact that you can scarcely dig anywhere all round and about without discovering them, gives me the impression that at some time or other a great battle was fought here, when perchance the castle was taken and dismantled, being destroyed by gunpowder. There are traces of fire to be seen on the east wall of one of the east towers. In one of these vault-like places I found a skull mortared into the wall, and close by were three skeletons in layers, one of them with the arm bones stretched above the skull.

IN THE SOUTH-WEST ANGLE

of the westernmost room I came upon the skeleton of a dead woman, and by her side, with the arm bones thrown around it, the skeleton of a child. Amongst various objects of interest which came to light from time to time were several red, yellow, and black tiles, the word "Nicholas" being apparently cut upon one of them; many pieces of stained glass, on one of which a bishop's mitre was rudely designed; deers' tynes, two large thimbles, one copper and the other brass; an old spur and part of a bit, the copper leg of what appear to have been a crucible, daggers and

tradesmens' tokens of the date of Elizabeth, together with various pieces of mediæval pottery, some of them of a graceful form, and two fragments having on them the Spencer arms. Perchance it was from this very castle that, throwing aside his mitre and donning a helmet, he mounted his charger and issued forth with his men-at-arms in pursuit of the rebel Litster, the Norwich tanner, with whom he came into collision at North Walsham, when, rushing over his barricades, gnashing his teeth, he seized him, piously absolved him, and then hung him erewhile kindly holding his head. One more matter I should add before bringing this paper to a close, and that is, on the farther side of the moat close to the east is a deep well, which was open till covered in by my predecessor. I felt sure that there ought to be another within the precincts of the castle, and so it proved to be. Searching about one day I discovered it in the highest tower to the east.

BRISLEY AND GRESSENHALL CHURCHES.

A brief visit having been paid to Brisley Church, where nothing of particular interest transpired, the party journeyed on to Gressenhall Church, dedicated to the Assumption of the Blessed Virgin. The edifice is chiefly in the Perpendicular style. It consists of a chancel, nave, aisles, north and south transepts, and porch, with a fine square tower springing from the centre. The south transept is called Hastings' Chapel, and the north transept Feraur's Chantry, or chapel. Dr. Jessopp said he considered this to be one of the most uninteresting churches in the diocese, at all events in this particular neighbourhood. Looking at the outside of the church, the aisles, and the transepts, everyone would agree that it would be difficult to find more infamous specimens of building. There was not a square yard of all the walls outside that would not disgrace a contracting jerry-builder in London. The restoration of the church he held to have been a great mistake. It would have been better to let it tumble down, and to have spent the money in putting up a church where the people lived.

SCARNING CHURCH.

Dr. Jessopp's church, that of St. Peter and St. Paul, at Scarning, was next seen. It consists of nave, chancel, south porch, and square tower. In 1859 it was restored and partly rebuilt. The preponderating style is Perpendicular, but the south porch and doorway and some other parts were Decorated. The ancient and beautifully carved rood-screen still remains, and upon it hangs the ancient sanctus bell. Dr. Jessopp said there was no indication of a church being in existence here before the thirteenth or the fourteenth century. There were a few fragments of Norman carving which might have been imported from somewhere else. His conjecture was that the place was overshadowed by the Premonstratensian abbey of Wendling, and that it continued to be a mere wooden church much later than most churches in this diocese. There were in it no mouldings or any of those other beautiful things which one looked upon as a necessary element in a Norfolk church. There was in it the least possible ornament, and it might truly be said of it that it was an uninteresting place.

ELSING CHURCH AND HALL.

The remainder of the afternoon was devoted to the Church of St. Peter at Elsing, and the handsome hall now in the occupation of Dr. Bustead. The church is a handsomely proportioned building in pure Decorated style, comprising nave, chancel, north chapel or sacristy, north and south porches, and square tower. On the pavement of the chancel are the remains of a splendid brass to the memory of Sir Hugh Hastings, who was buried there in 1347, and is supposed to have founded the church in 1340. The knight was represented in a mixed armour of mail and plate, with a loosely hanging jupon and sword-belt, a straight two-edged sword, and a shield. The legs have disappeared. The original font cover, restored within recent years to much of its ancient beauty, is said to be one of the finest in the kingdom.

A LEEDS MUSIC HALL.

THE erection of a new musical hall—the Empire Palace—has just been completed at Leeds. With seating accommodation for 2,000, and standing room for another thousand, the new theatre will rank as one of the most commodious buildings in Leeds. Architecturally, it is an ornament to Briggate, beside adding materially to the structural improvements now being made by the Leeds Estates Company in Wood Street and the immediate neighbourhood. A strong suggestion of the Flemish enters into the style, both inside and out. The front is terra-cotta over a granite base, and above all is a well-designed gable, supporting a life-size figure and an arc light. Internally, the prevailing tones are cream and gold.

RELIEVED BY COPPER BRONZE

on the mouldings of the ceiling and the fronts of boxes, circle, balcony, and amphitheatre, and by a "crushed pink" plush on the stalls and circle seats and other parts where draperies are brought into use. The tableaux curtains and valance, for instance, will be of this colour; also the Wilton pile carpet up the marble steps of the entrance, and on the floors of the grand saloon, and principal parts of the house. Italian marble columns, and moulded panels filled with paintings over mosaic floors, give artistic feeling to the vestibule. Coloured representations of carnival scenes also adorn four sides of the open roof of the theatre itself, where a pretty effect is obtained by the festooning of ornamental brass work to be employed as electroliers. The system of double staircases, entrances, and exits from and into the four surrounding streets reflects credit upon the ingenuity of the architect. Mr. Frank Matcham, however, has had much experience in this particular line, therefore much may be expected from him. The stairways and corridors are all 5ft. in width, and the arrangements for seeing the stage from every floor seem to be very satisfactory. The refreshment saloon attached to the grand circle is to be an apartment of some distinction, from the decorator's standpoint.

OVER A MARBLE BALUSTRADE

one can look down into the vestibule; and, projecting from the adjoining smoking lounge, a balcony furnishes peeps into Briggate. Then—to pass to the other side of the house—an iron curtain is in readiness as a protective partition between stage and auditorium, and here, too, are all the latest appliances for the production of scenic effects, besides dressing rooms and so forth. Ventilation, among other matters, has received due attention. A sliding roof gives a view of the sky whenever it is essential to rid the theatre of foul air. Some idea of the size of the house may be gathered when it is stated that the stage measures 65ft. in width. Smaller than the Empire Palace at Liverpool, and smaller than Manchester's latest music hall, it is nevertheless of tolerable dimensions. The characteristic feature is its compactness.

The preparations are well advanced for opening the new extension of the Hampstead Workhouse, which has been erected by the Hampstead Guardians at the junction of Heath Street and New End, Hampstead. The new structure, which will accommodate an additional 100 inmates, will cost about £30,000. The electric light will be installed throughout.

SOME excitement was occasioned in Fetter Lane last Thursday in consequence of a loud report as of falling brickwork. It transpired that some old erections—part of a colony of rookeries which are being cleared away—in Norwich Street had collapsed. Workmen have been pulling down the premises behind the old coaching house, the White Horse, and had only just left work for the day when the remaining high walls fell with a crash. Fortunately no one was passing the spot at the moment, but Norwich Street was completely blocked with bricks, &c., for a considerable time.

THE SOANE MUSEUM.

THERE are scenes of beauty in this City which the average Londoner never catches a glimpse of. There are places peopled by spirits of the dead, and corners crowded with memories of a past which the march of the modern City has improved away. Most of us ought, perhaps, to be pardoned for not knowing these things. The other day we turned into one of these for the sake of relief from the merciless August sunlight. Around Lincoln's-inn-fields the glare in the streets was blinding. But there, on the north side, stood an old house, fresh and smiling in a new coat of paint, which seemed to promise the shade so ardently desired. And so it proved. Inside the light was subdued, and there was a delicious pervasive coolness. This was the museum of Sir John Soane. Sir John Soane was Professor of Architecture at the Royal Academy. He wrote after his name R.A., F.R.S., F.S.A., and a good many more complimentary letters. He was architect, also, to the Bank of England, and designed the four façades, the rotunda, and most of the public offices. His

COLLECTION OF ANTIQUITIES,

gathered with infinite pains throughout a long life, was secured to the public by Act of Parliament in 1833. The house stands exactly as its owner left it, all its twenty-four rooms packed from floor to ceiling with articles of *virtu*. Dr. Waagen said, somewhat unkindly, that "the crowded and labyrinthine house leaves an impression as of a feverish dream. Something must have been wrong with the German Art critic to make him connect the Soane collection with a feverish dream. Crowded, the place certainly is;

FAR TOO CROWDED TO SHOW OFF

the countless exhibits to advantage. But it should be remembered that this is not strictly a public museum at all. It is the house of an antiquary, stored according to its owner's idiosyncrasy, and left mainly for the use of students. Nor is a single visit of much use, if one would get any kind of complete notion of the collection. It will depend upon your taste as to what relative value you give to the Soane treasures; whether illuminated manuscripts, pictures, or the magnificent alabaster sarcophagus. For ourselves, we incline to favour the last. It was discovered by Belzoni in the Valley of the Tombs of the Kings, near Gournou, Thebes, and bought by Sir John Soane in 1824 for £2000, a price which is absurdly low. The sarcophagus is sculptured within and without with

SMALL FIGURES IN INTAGLIO,

coloured with dark blue. When a light is held inside, it is quite transparent. But if the sarcophagus is quite the most fascinating object in the Museum, there are others which may not be overlooked. Hogarth is here, with the eight pictures of "The Rake's Progress" and the four of "The Election," and Sir Joshua Reynolds with the famous "Snake in the Grass;" also a few Turners. Tasso's MS. of the "Jerusalem" is here, too, and

SOME FINE ILLUMINATED BOOKS,

including one superb example by Giulio Clovio, a pupil of Michael Angelo. A short time ago the newspapers made merry over an alleged posthumous joke played by Sir John Soane on his trustees. The Museum contained three sealed cupboards which, according to the donor's will, were not to be opened until, respectively, thirty, fifty, and sixty years after his death. Because the cupboards were found to contain, not further treasures,

BUT ONLY FAMILY PAPERS,

Sir John was put down as a practical, and rather heavy joker. Nothing of the sort, however. The papers referred to private family quarrels, which were far better covered up. The Museum is now closed for six months. The endowment is not sufficient to cover the expenses of attendance all the year round. But, although the door is closed, the curator likes it to be known that no visitor from the country or from across the sea is forbidden access, and that anyone writing for a ticket may visit the Museum on any day in the year.

Professional Items.

"BRAHAN" (near Perth).—This new mansion, now in the course of erection for Mr. Rufus D. Pullar, of Messrs. J. Pullar and Sons, dyers, Perth, is built on the side of a hill on the Crieff Road, about $1\frac{1}{2}$ miles from Perth. It stands on the site of an old house which was pulled down, the old trees, hedges, and orchard of the old garden remaining. The garden front faces south-east, the entrance court being on the opposite side, and the kitchen court to the north-east. The walls are harled, and the roof covered with green slates. From its commanding situation a magnificent view of Perth and the surrounding district in every direction is obtained. The house is a most commodious one, and is fitted up on the most modern principles, special attention having been paid to ventilation and sanitation. The architects are Messrs. Francis W. Bedford, A.R.I.B.A., and Sydney D. Kitson, M.A., of Leeds. The clerk of works is Mr. D. Robertson, and the following contractors are being employed upon the works:—Excavators and concrete, Messrs. D. R. Taylor, Perth; steel work, Messrs. P. and W. MacLellan, Limited, Glasgow; masons' and bricklayers' work, Messrs. J. and C. Hay, Dundee; carpenter and joiner work, Messrs. Stewart and MacFarlane, Perth; plumber and drainage work, Messrs. Frew and Son, Perth; plasterer's work, Messrs. J. Mackay and Son, Perth; glazier's work, Mr. C. Alexander, Perth; leaded glazing, Mr. W. Pape, Leeds; ornamental glazing, Mr. W. Pape and Mr. Stephen Adam, Glasgow; and Messrs. G. Walton and Co., Glasgow; electric light installation, Messrs. Ernest Scott and Mountain, Newcastle; electric bells and speaking tubes, Messrs. Westwood and Sons, Perth; ornamental plaster work, Mr. G. P. Bankart, Leicester; hot water heating, Messrs. H. Walker and Son, Newcastle-on-Tyne; case-ments, Messrs. Williams Brothers, Chester; lift, Messrs. John Bryden and Sons, Edinburgh; carving, Mr. J. Hayes, Edinburgh; tiling, Messrs. Field and Allen, Edinburgh, and Messrs. C. W. Williams and Co., Manchester; panellings and interior woodwork, &c., Messrs. Marsh, Jones, Cribb, and Co., Leeds; Messrs. Stewart and MacFarlane, Perth; and Mr. C. Grant, Perth. The building is now well advanced, and it is expected that the house will be ready for occupation early in the spring of next year. The drawings of the house were exhibited in this year's Academy.

BRISTOL.—The new Board School at Westbury Park, Bristol, has just been opened. The buildings of the school are the first instalment of what will probably be a large school, and are therefore arranged with a view to extension, a circumstance which necessitates the initial outlay being proportionately greater than for a complete school. They comprise a lofty central hall, with open roof and windows all round, two class-rooms, each for fifty children, and a babies' room for fifty. A pretty feature is the octagonal teachers' room. This has a lavatory adjoining, and there is a large cloak-room and lavatory for the children, and a room for the use of the caretaker. The floors are laid with maple blocks, and the dadoes formed with maroon-colour glazed bricks, which contrast effectively with the green wall surface. The whole building is heated by hot water, and the hall and class-rooms have also fire-places of glazed faience. The exterior is simply treated in red brick, with white sashes and tile roofs, and has a bright and cheerful effect, grouping well with its pleasant surroundings. One matter may be mentioned as creditable to all concerned—not a penny has been required for "extras." The architects are Messrs. La Trobe and Weston, F.R.I.B.A.

BROOMFIELD (co. Monaghan).—The ceremony of laying the foundation stone of the proposed new Church of St. Patrick at Broomfield, in the parish of Donaghmoyn, county Monaghan, was performed last week by the Bishop of Clogher. The present edifice is

about a hundred years old, its arrangements are of the most primitive character, and even its size is inadequate to afford accommodation to the congregation. The site of the proposed new church has been admirably selected on a gentle eminence in the immediate neighbourhood of the old one. It has been designed by Mr. George L. O'Connor, C.E., M.R.I.A.I., of Dublin. It will be in the Gothic style of Architecture, cruciform in plan, with nave, transepts, and sacristies. The length of the nave will be 80ft., and the width 34ft. The walls will be built of limestone, rubble masonry, lined on the inside by brickwork. They will be strengthened by buttresses, having limestone chiselled weatherings. A spacious gallery and organ loft will be provided at west side, and from which will also arise a belfry tower. The roof will be of open timber construction, with wrought moulded principals and carved ribs. Ample provision will be made for ventilation and lighting. Lancet windows will pierce the walls in the alternate spaces between the buttresses. It is intended that the materials throughout will be, as far as practicable, of Irish manufacture.

BRUSSELS.—We give an illustration of part of the hall and staircase of a new house at Brussels. The drawing shows the fireplace under the staircase. The house was designed by Mr. M. H. Baillie-Scott, of Douglas, Isle of Man, for Mr. W. Schlobach, an artist, and a feature of the design is a large studio with an open timber roof.

DEVONPORT.—A new Science, Art, and Technical School is now approaching completion at Devonport. The building from its position, near the South Western Railway Station, stands clear of all other objects, and is prominent for miles in every direction. The principal entrance in the south front will be approached from the road by an elliptical drive, entered by two openings in the iron railed boundary wall. A flight of granite steps at the foot of the clock tower lead to the vestibule, the floor of which is tiled; thence another flight of steps of Portland stone brings one to the level of the first floor corridor. The doors between the vestibule and corridor are of walnut, glazed, and elaborately moulded, the caps of the pilasters and frieze-rail being carved. At the eastern end of this corridor is the art school entrance, and a separate entrance to the area and caretaker's apartments. On the first floor is the large hall, 57ft. by 26ft., the mechanical drawing class-room, several other class-rooms, the secretary's office and committee's room. On the upper floor another corridor extends the whole length of the building, lighted by two lantern lights and a window at either end. On the east side are the Art rooms, whilst at the west end the front is appropriated to the chemical laboratory, preparation and balance rooms, the back rooms for chemical and physical lectures, and the physical laboratory. From the upper corridor a central main staircase and two others at the extreme ends lead to the basement, in which are the caretaker's apartments, the electrical and mechanical engineering rooms, the plumbers' workshop and metallurgy rooms, a room for manual training and carpentry, and the plaster casting room, with meter room, Keith's heating boiler, &c. A room is also provided in the basement for photography. The masters' and mistresses' rooms are on mezzanine floors at the west and east ends of the building, with w.c.'s and lavatories below. The principle feature in the façade is the clock tower, which rises 120ft. above the road. Although this is an addition to the original design, yet the tower is well proportioned, and the graceful outline of roof, with the clock and bells, make up a handsome pile. The wall facing is irregular coursed rubble, point nobbled, of Cattedown limestone, with dressings of Ham Hill stone, an excellent contrast being obtained. Ventilation is well secured by means of four 30in. exhaust ventilators in the ridges, with airtight trunks in the roofs in connection with open frames in the ceiling of each of the rooms. The whole of the floors,

dadoes, and the internal joinery generally are of pitchpine, the doors and frames, roof timbers, air trunks, and dadoes being varnished. All the stairs to the first floor are of granite, with pitchpine above, and ornamental cast-iron balusters are used throughout.

FOLKESTONE.—The new wing of the Royal Pavilion Hotel, Folkestone, has been opened. The architect is Colonel Edis, and his principal object appears to have been to construct a commodious and comfortable edifice rather than one with a strikingly decorative exterior. The lounge is entered from the southern or garden entrance, and is a spacious apartment, tastefully furnished. Without going into details, the same remark applies to the reading room, dining hall, drawing room, and indeed every room throughout the building. The whole arrangements have been worked out by Messrs. Maple and Co. for Messrs. Henry Frederick and Co., the proprietors of the Coburg Hotel, Berkeley Square.

GILLINGHAM.—A portion of the new Catholic Mission Church of "Our Lady of Perpetual Succour," at Gillingham, was opened last week by the Bishop of Northampton. The church has been built by Mr. F. R. Allen's executors, of Beccles, from plans drawn up by Mr. R. Banham, Mayor of Beccles. It is of Roman style, red brick outside, with a sanctuary, and five bays to the nave. When it is completed there will be seven bays, and there will also be two companion towers. There is a moulded plinth, pilasters, and corvise, and there are circular windows in the roof. The nave is 40ft. long by 18ft wide, and the circular sanctuary is 20ft. by 18ft.

HESSAY.—The whole of the work in connection with the erection and completion of the new church at Hessay, near York, has been entrusted to Mr. Anthony Lyons, contractor of Norton, Malton. Mr. C. Hodgson Fowler, F.S.A., Durham, is the architect.

LONDON.—At the Royal Botanic Society's Gardens, Regent's Park, a new public café has been erected, together with a private dining-hall 45ft. long, by 30ft. wide, reading and reception rooms, and ladies' and gentlemen's cloak rooms. There is a spacious "hall lounge" entered from the main conservatory. With the exception of the café, the building is intended for the exclusive use of Fellows of the Society and their friends. The foundations and superstructure were carried out by Messrs. Hunkey Bros., of Croydon; the decorations and furnishing by Messrs. Maple and Co. Limited; and the heating by the Thames Bank Iron Co. The architect is Mr. H. W. Hetherington Palmer, of the Outer Temple, W.C.

NOTTINGHAM.—The new General Post Office, in Queen Street, Nottingham, has been formally opened. The ground floor is occupied by the public office, the rooms of the postmaster, the chief clerk, the inquiry-room, the parcels office, and the office for private box-holders. The public office, although not the largest in the kingdom, is considered to be one of the best furnished. The counter, forming three sides to a square, is of polished mahogany, and the handsome roof is supported by four massive columns, the telegram counters being in the centre. At one side of this office is a telephone call-room for the trunk lines. On the second floor is a very spacious sorting office, fitted up with every convenience for the workers, the returned letter branch of the establishment, the medical officer's rooms, and several private rooms. The third floor contains the telegraph school, the office of the accountant, cloakrooms, several retiring rooms, and the dining rooms. On the fourth floor are the instrument room, the telephone room, the battery room, and the "record rooms."

PORT TALBOT.—The extraordinary development which has recently occurred at Port Talbot in view of the approaching completion of the new dock and railway has just been followed by an unopposed and successful

application to the local magistrates to license a splendid hotel to be built by Mr. D. Williams, of Brynhaulog, Bridgend. The services of Mr. George Robinson, architect, Cardiff, have been secured, and he has worked out an effective design in the domestic Gothic style. The site is close to Port Talbot Station. It is a three-cornered piece, containing an area of about 2000yds. on Station Street. Station Street is to be widened to 60ft. Close by are in course of construction the county police offices, a handsome pile; and adjoining them, on the other side, will be the new premises of Lloyds' Bank. The front elevation will be mainly of native stone, with Victoria stone dressings, the latter being an almost indestructible ornamentation now being largely adopted in London. The estimated cost is £10,000, exclusive of furniture and fittings. Mr. Robinson has introduced into his plans the latest ideas of hotel structural arrangement. The commercial travellers' convenience has been well considered. For example, a series of capacious lockers has been designed, in which commercials may store their goods in safety and without confusion when not displaying them to customers. There will be twenty bedrooms for the guests' use, but under the lease the proprietor is obliged to provide twelve more when called upon.

SOUTH SHIELDS.—The new Unionist Club, South Shields, was formally opened last Wednesday by the Marquis of Londonderry, K.G., in the presence of a large concourse of people. The new building is situate in Catherine Street, which is contiguous to Fowler Street, and within a couple of minutes' walk from the centre of the town. In the general design and arrangement of the building, Mr. J. H. Morton, the architect, has shown no small skill and artistic taste. It is four stories in height, buff terra-cotta being used up to the first floor, with deep red bricks and terra-cotta windows above. The internal arrangements admirably adapt themselves for the purposes for which they have been erected. The approach from the street is through a high vaulted lobby to the entrance hall, and beyond a wide staircase leading to the floors above. On the right of the entrance hall is the reading room, a large, comfortable, and well-lighted apartment. Facing this is a commodious smoke room, with a buffet bar in dark mahogany with glazed screens, and which adds greatly to the appearance of the room. In the rear are the cloak room and lavatories, with walls of glazed bricks. The first floor is utilised entirely as a billiard room, and possesses accommodation for three tables. Above this, there is another large room covering the entire area of the second floor, but which can be divided into three smaller rooms by collapsible partitions. It is intended to use this room for assemblies and smoking concerts, a small raised platform having been placed in one corner. When not in use for this purpose it will be partitioned off for recreative purposes, such as games at chess, draughts, and cards. A lift runs from the buffet on the ground floor to the top of the building, by means of which refreshments can be supplied to the different rooms, thus doing away with the necessity of the waitresses travelling up and down the stairs. The top of the building is set apart for the caretaker's residence, and contains four large rooms with pantries and other requirements, while the whole of the basement is utilised as cellars. The building has been fitted throughout with gas and the electric light, and in addition to the steamcoils and radiators for heating there are fireplaces in all the rooms. The total cost of the building has been between £4000 and £5000.

TINTAGEL.—Good progress is being made with the building of King Arthur's Castle Hotel, on the hillside opposite the castle ruins, at Tintagel. Mr. Silvanus Trevail, J.P., of Truro, is the architect; Mr. Carkeek is the builder; the sanitary fittings are by Messrs. Jennings and Messrs. Doulton, of Lambeth; and the furnishing contract has been taken by Messrs. Waring and Co., of London and Liverpool. The hotel and grounds occupy $7\frac{1}{2}$ acres of land.

Views and Reviews.

"HURST'S ARCHITECTURAL SURVEYOR'S HANDBOOK."

The fifteenth edition of this extremely useful work, first published in 1864, has just reached us, it having been entirely revised and extended up to date. By this time its value is so well known and recognised that little or nothing new can be said about it. The usefulness of the work lies not so much in the facts it contains, as in the manner of their arrangement, which makes it so easy of reference. Undoubtedly it is one of the most useful works an architect can possess.

* A Handbook of Formule, Tables, and Memoranda for Architectural Surveyors and others engaged in Building. By John Thomas Hurst. Fifteenth Edition, 1898. 5s. London: E. and F. N. Spon, Ltd.

THE GAS ENGINEER'S POCKET-BOOK.*

Mr. O'Connor has done useful work in providing such a comprehensive collection of facts and precedents connected with a gas engineer's profession. There are many tables and memoranda arranged to facilitate reference in this attractive little volume, containing chapters on general mathematical tables, unloading materials and storage, retort house, condensers, boilers, engines, pumps, and exhausters, scrubbers and washers, purifiers, gasholder tanks, gasholders, workshop notes, storing materials, retort house working, condensing gas, exhausters, &c., washing and scrubbing, purification, the care of gasholders, distributing gas, testing, enriching processes, and products works. It should surely suffice for any eventuality that might occur upon a gas-works. There is much matter, however, that would be better for a little clearer arrangement; for instance, the notes upon mains would have been better treated apart from those upon service pipes. It would be idle, however, to cavil at the work upon a small matter of arrangement, which can easily be remedied in subsequent editions, and all are lit is due to the author for having collected such a valuable mass of information for the benefit of his profession.

* "The Gas Engineer's Pocket-book," comprising tables, notes, and memoranda relating to the manufacture, distribution, and use of coal gas and the construction of gas works. By Henry O'Connor, A.M.I.C.E., Vice-President of the Society of Engineers, 1898. P. 102, 10s. 6d. London: Crosby, Lockwood, and Son.

PRACTICAL SMOKE PREVENTION.*

Mr. Nicholson has embodied much practical information in this little pamphlet, knowledge acquired no doubt by his experience and duties as a smoke inspector in one of England's smokiest cities, Sheffield. While the work does not lead us much nearer the solution of an absolute cure, the author very clearly shows that much may be done to prevent the smoke nuisance, and that most of the smoke that poisons the air and disfigures our buildings is due to ignorance, want of proper apparatus, and negligence, intentional and unintentional. The work is a timely one, for people, after an outburst of indignation, usually lapse into a spirit of despair, and treat the question as hopeless. We have not heard much of the smoke question lately, and yet it is a growing question, and not one to be shelved. Mr. Nicholson's panacea for the evil is intelligent stoking, and this apart from any appliances, automatic or otherwise. While the opinion is indisputable, we fear the solution of the smoke question is still very far off, for the laziness of the British workman is such that the benefit of pure air will hardly weigh with him so much as the extra labour, which the author does not hesitate to state is absolutely necessary. In short, the stoker must use his head as well as his hands. The book is singularly free from errors; but the plural of apparatus is not "apparatuses," as given on page 23. We recommend everybody to buy this little work, for its price is within everybody's reach, and its mission concerns all men.

* "Practical Smoke Prevention." By W. Nicholson. Price 3d. Sanitary Publishing Co. Ltd.

Enquiry Department.

HOLLOW WALL CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you give sketches showing the method of construction on each of the following section lines. I would also be pleased to

have any information about hollow wall construction.—Yours,
McK.

The accompanying sections will be found suitable for a small detached villa in an exposed situation; for less substantial property a $4\frac{1}{2}$ in. inner wall might be considered sufficient for the ground story, although this is not advised. It is usual to build these hollow walls with a $4\frac{1}{2}$ in. skin outside, as there is thus less substance to absorb moisture;

FIG. 1.—SECTION AT J.

and when wet it dries quicker; also the thicker portion being inside to carry the constructive timber, necessarily shortens the span and economises material. The hollow space between the two walls should not exceed 3 in., and is more frequently $2\frac{1}{2}$ in. The two portions are kept entirely separate between the ground line and the upper ceiling except at the reveals of door and window openings; these are formed, and the space closed, as shown in Figs. 3 and 7,

FIG. 2.—SECTION AT X.

FIG. 3.—SECTION AT Y.

by King closers, all the hidden portion of these latter bricks should be covered with tar or melted asphalt before laying to prevent the transmission of moisture to the inner wall. Starting about four courses from the ground, and at every third course thereafter, rows of

The copyright of the accompanying drawings is reserved.

FIG. 4.—SECTION AT M AND R.

FIG. 5.—SECTION AT H.

wrought or cast galvanised iron ties, spaced about 3 ft. apart, should be built in the brickwork, as shown in the sketches, to tie the work together; they should not be placed vertically over each other, but hit and miss fashion. These ties are made of various shapes, but those having a good dip in the middle are best. There are also purpose made

FIG. 6.—SECTION AT S.

bricks in the market, but in cases of unequal settlement these are very liable to break. It is not advisable to take the hollow below the ground line, as water will accumulate therein, but where this must be done to protect a basement the inner wall should be covered with asphalt up to the damp course, the

FIG. 8.—SECTION AT G.

top of the hollow should be closed at or near the ceiling line, and immediately above, a damp course must be inserted, as shown in Fig. 8. Over all doors and window heads a strip of lead should be built in the outer wall, and turned up to form a gutter as shown in Fig. 4; this should be long enough

to overhang each end about 2 in. During the building of the wall, pieces of board laid on the ties will prevent mortar, &c., falling into the space. Fig. 1 is a vertical section at the foot of the wall; Fig. 2, a vertical section through ground floor window. The stone sill must not quite bridge the space; both sills are grooved, and a strip of lead, bent and bedded in cement, prevents the ingress of water. Fig. 3, a similar section of first floor;

FIG. 9.—SECTION AT O P.

Figs. 4 and 5, horizontal sections through the reveals (dotted lines show courses above and below); Fig. 6, vertical section through head of doorway, showing stone lintel and lead gutter; Fig. 7, a horizontal section through the chimney breasts, the left half on the ground floor, the right half on the first floor; Fig. 8, a section through the eaves, showing top of the hollow wall; Fig. 9, section of

FIG. 10.—SECTION AT C D.

corner of wall at ground floor; Fig. 10, section of chimney above roof. Sections at gable and parapet are not necessary, as these will be built in the ordinary manner, but with the damp course taken all round at the same level.

It has been virtually decided to provide the Royal Courts of Justice with lifts at an early date for the accommodation of those having business at the offices and chambers situated on the upper floors of the building. It is understood that about four lifts will be erected for this purpose, of which two will be situated in the east block, and one each in the western and main blocks.

GROUND FLOOR.

FIRST FLOOR.

FIG. 7.—SECTION THROUGH CHIMNEY BREASTS.

KEYSTONES.

THE French Government is about to erect a new Parliament House from the design of M. Buquet.

THE premises of Messrs. S. Ranson and Co., of Britannia Works, Kensal Road, W., builders and contractors, have been burnt down.

THE Crewe Town Council propose to supply the Borough with electric light, at a cost of £25,000. Professor Hopkinson, F.R.S., is the consulting engineer.

MESSRS. SPIERS AND POND propose to erect a new hotel on Kirkley Cliff, Lowestoft. Plans have been prepared by Messrs. L. H. Isaacs and H. L. Florence, of London.

THE new Grand Theatre, Hanley, has just been completed from designs by Mr. Frank Matcham. The cost was £25,000. Mr. T. Goodwin, Hanley, was the builder.

THE new theatre in Charing Cross Road for Mr. Chas. Wyndham has been designed by Mr. W. G. R. Sprague. Mr. C. F. Kearley's is the successful tender at £20,400.

HERNE BAY is to have a new church, to be dedicated to St. John the Evangelist. The estimated cost is £8000. Mr. R. P. Day, Diocesan Architect, has prepared the plans.

THE first premium of thirty-five guineas for laying out the Appleton House Estate, Widnes, as a public park, has been awarded to Messrs. William Barron and Son, of Elvaston Nurseries, Borrowash, Derby.

THE London County Council have acquired the site of two houses in Warner Street, Mount Pleasant, for the enlargement of their Weights and Measures Testing Office. The work of demolition is now in progress.

MR. W. H. PREECE, C.B., F.R.S., Pres. Inst.C.E., Chief Engineer to the Post Office, has published a denial of the report that he is instructed by the Postmaster-General to prepare a scheme for a national telephone system.

A LOCAL GOVERNMENT INQUIRY has recently been held by Lieut.-Colonel A. C. Smith, R.E., into a proposal of the Canterbury Town Council to borrow £70,000, for the purchase of a site, and the erection of a lunatic asylum. Mr. W. Jennings is the architect.

THE Borough Sanatorium of St. Helen's at Pleasley Vale has just been completed. The borough engineer, Mr. Geo. Broom, designed the buildings, which were erected by Messrs. Whittaker and Woods, St. Helen's, under the superintendence of Mr. H. Helens, Clerk of the Works.

THE temporary bridge between Lambeth and Millbank, which has been open for traffic a week, is now deemed by the engineers of the London County Council to be capable of carrying the traffic which will be diverted from Vauxhall Bridge, and the latter is now closed both to foot passengers and vehicles. The work of demolition of the old bridge, which was built between the years 1811 and 1816 at a cost of £300,000, will, however, not be commenced until the 7th or 8th of next month.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BASFORD (Notts).—For re-erecting Beaufit-lane Bridge over the River Erewash, for the Rural District Council. Mr. G. W. Hawley, surveyor, York Chambers, King-street, Nottingham:—

flushing tanks, river crossings, and other contingent works, for the Urban District Council. Messrs. Spinks and Beaver, engineers, 9, Albert-square, Manchester:—
 J. Ainscouth and Son ... £5,195 3 0
 G. M. Collins ... 4,784 15 8
 Geo. Bell ... 4,615 6 11
 Geo. Freeman and Sons ... 4,509 14 0

NEW SWINDON (Wilts).—For the erection of workshops (Section B), Victoria-road, for the Urban District Council. Mr. H. J. Hamp, surveyor, Public Offices, Swindon:—
 C. Williams ... £233 0 0
 J. Williams ... 813 0 0
 H. and C. Spackman, Swindon* ... £804 19 6

NEWTOWNARDS (Ireland).—For the erection of a dispensary and residence, Lisbarnet, for the Union Guardians. Mr. T. Roe, architect, 1, Lombard-street, Belfast:—
 McCune ... £1,495
 Hanna ... 1,400
 Montgomery ... 1,297
 Caldwell ... 1,197
 Wm. Kerr ... £1,200
 Campbell and Lowry ... 1,290
 Wm. McGee ... 1,165
 Morrow, Ballygowan* ... 1,095

RAVENSTONEDALE.—For erecting the first portion of a new hotel at Ravenstonedale, for Mr. John Carver, J.P., of Easing. Mr. R. Walker, architect, Windermere:—
 Stable Block only.

Masonry.—T. Potter ...
 Joinery.—J. C. Brunskill ...
 Plumbing.—Brunskill and Nicholson ...
 Plastering.—Armstrong ...
 Painting.—Brunskill ...

READING.—For erecting new premises, Broad-street, Reading, for Mr. A. H. Bull. Mr. F. W. Albury, architect, Friar-street, Reading. Quantities by Mr. A. R. Henderson, surveyor, 47, Pall-mall, S.W.:—
 Higgs and Sons ... £4,085
 Bottrill and Son ... 4,401
 Stokes ... 4,339
 Kingler ... 4,370
 Lewis Brothers ... £4,350
 Margetts ... 4,279
 Fitt ... 4,210

[Amended and reduced estimate accepted at £3,747.]

ROCHESTER.—For additions, &c., to Wainscott Schools, for the Frindsbury School Board. Mr. G. E. Bond, architect, High-street, Rochester:—
 H. E. Phillips ... £295
 C. Roberts ... 588
 G. West ... 576
 G. Gates ... £275
 A. Ruby ... 549
 H. Wyles, Chatham* ... 539

SHREWSBURY.—Accepted for the erection of technical school buildings, Radbrook, for the Governors of the Shropshire Technical School for Girls. Mr. C. E. Dalgleish, architect, Central-chambers, Wellington, Salop. Quantities by the architect:—
 Building.—John Gethin ... £6,390 0 0
 Plumbing.—Marston and Co. ... 683 10 4
 Painting and Glazing.—J. H. Perks ... 202 10 0
 [Exclusive of heating and ventilators.]
 [All of Shrewsbury.]

STOCKTON-ON-TEES.—For additions to schools, Bailey-street, and Bowesfield-lane, for the School Board. Mr. Arthur Harrison, architect, 99, High-street, Stockton. Quantities by architect:—

Bailey-street School Additions.
 J. Davison ... £1,020 10 11
 A. J. Cooke & Co. ... 1,831 15 8
 A. J. Cooke ... 1,847 13 0
 Craggs and Benson, Stockton* ... £1,822 0

* Accepted subject to Educational Department's approval (now obtained).
 Bowesfield-lane School Addition.
 J. Davison ... £651 8 11
 A. J. Cooke, Stockton* ... 632 10 0
 A. J. Cooke, Stockton* ... 618 3 0
 Craggs and Benson ... 609 14 10
 A. J. Cooke, Stockton* ... *Accepted.

STRANORLAR (Ireland).—For the erection of five labourers' cottages, for the Union Guardians. Mr. W. McElwee, architect, Foyle-street, Londonderry:—
 McCaffrey, Lifford ... £650

THETFORD (Norfolk).—For the erection of a vestry, St. Cuthbert's Church. Mr. A. J. Lacey, architect, 6, Upper King-street, Norwich:—
 J. W. Bunting & Son ... £213 9
 W. Boughton & Sons ... 235 0
 S. Holden, Thetford* ... 276 0
 W. Curtis ... £230 0
 *Accepted.

CONTRACTS OPEN.

RUGBY URBAN DISTRICT COUNCIL. TO CONTRACTORS.

The Urban District Council of Rugby invite TENDERS FOR CONSTRUCTING about 170 yards of MAIN OUTFALL SEWER (partly of Cast-iron Pipes), 3ft. internal diameter, together with SCREENING CHAMBER, MANHOLES, FENCING, and other WORKS, at their Sewage Farm, New Bilton.

The drawings may be seen, and a copy of the specification, bill of quantities, and form of Tender obtained at my office on payment of One Guinea, which will be returned on receipt of a bona-fide Tender.

Sealed Tenders, endorsed "Outfall Sewer," to be sent to Mr. T. M. WRATISLAW, Clerk to the Council, Rugby, on or before SEPTEMBER 13th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
 D. G. MACDONALD, Assoc. M. Inst., C.E.,
 Surveyor.

Rugby, August 24th, 1898.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

HEALTH EXHIBITION.

THE Health Exhibition, given in connection with the visit to Dublin of the Hygienic Congress of the Royal Institute of Public Health, is being held in the Royal University Buildings, Earlsfort Terrace. All the principal chambers as well as the grounds of the University Building have been made available for the purposes of the Exhibition, and the rooms are now filled with the specimens contributed by some ninety-six exhibitors. An Exhibition of this sort has been usually held in connection with the meeting of the Congress, and the scope of the present one has been considerably enlarged beyond the display of health appliances, with a view to making it as attractive as possible to the public, and of enlisting their interest in the important objects which the Institute exists to promote.

THE EXHIBITS

illustrative of modern hygienic doctrine and improved appliances, together with the other matters admitted as closely connected with hygiene, are arranged in the Grand Entrance Hall and Gallery, the Main Hall, the Sanitary Hall, and the Corridor. As for the numerous exhibits which especially illustrate modern hygiene, there are specimens of almost every article and appliance for the protection of health from the assaults of disease germs, the contamination of foul air, and other noxious influences, to say nothing of the curatives and restoratives which belong to the especial domain of the pharmaceutical chemist, and also aerated waters and cocoas, &c. Baths, kitchen ranges, disinfecting apparatus, and other articles of furniture conducive to cleanliness and comfort and of domestic utility are also to be seen in a variety of forms. A large disinfecting machine, shown by Messrs. Maguire and Gatchell, will be likely to attract particular notice. One of the most interesting objects in the Sanitary Hall is the apparatus exhibited by Guinness and Co. Limited, for the manufacture of mineral waters with carbonic acid supplied from their establishment in James's Street, where by a patented process this gas is reduced by pressure to a liquid, and also a solid form. The gas is, in the first instance, a residuum from the brewing process; and it is utilised for the purposes of the mineral waters manufacturer. The apparatus in question will be shown at work. Messrs. Dobson and Curtis, who have a large stand in the same hall, will supply from an electric installation the electricity required for illuminating purposes in the Exhibition. The exhibits of the British Acetylene Gas Company, the Sissons Gas Company, and the Sardin Gas Generation Syndicate, will be found worthy of special attention. The Sunlight Gas Company, of Wellington Quay, are exhibitors on the same lines. The Grand Concert Hall and the Main Hall will be lit with gas by apparatus supplied by Messrs. Stott and Co., of Oldham.

IN THE SANITARY HALL

are to be seen, besides various other objects, stands of the Septic Tank Company, of Exeter, and of the Oxygen Sewage Purification Company, of Dublin, who claim to show the most improved modes of purifying sewage, and whose respective processes formed the subject of papers read at the Congress. In the gallery of the Entrance Hall are to be seen specimens of the new colour photography, and lectures descriptive of the process will be given. A very interesting exhibition, indeed, will be the lantern and screen display of living ants at work. A very novel feature, which will be seen this week, will be gymnastic displays by a party of Swedish young lady teachers. A room is specially allotted to the reception of an interesting bacteriological collection which Professor E. J. McWeeny contributes; and here the visitor may see under the microscope specimens of sewage organisms from the Liffey, and of disease-producing and harmless bacteria. In another room off the entrance hall Mr. Henry Burns, of the Crystal Palace, will give demonstrations of the Röntgen Rays; and in the entertainment room, approached from the gallery of the entrance hall, a lecture will be given each

evening on the Photochromoscope, by Mr. E. Sanger Shepherd.

NAMES OF THE EXHIBITORS:—

Adams and Co., York and London; Alione Co., 17, The Broadway, West Norwood, London, S.E.; American Radiator Co., London; Anderson, Stanford, and Ridgeway, Grafton Street, Dublin; Ash, Thomas and Co., Cannon Street, Birmingham; Billington Brothers, Hibernia Works, Cook Street, Dublin; Boileau and Boyd, 92, Bride Street, Dublin; British Acetylene Gas Generator Co., Kirkcaldy; British Sanitary Co., Kirkcaldy; Buckley, Miss A. M., 2, Swanson Terrace, Limerick; Bulger, Joseph, 42, Mary Street, Dublin; Burmantoft's Pottery Co., Leeds; Burn Bros., 23, Charing Cross, London, S.W.; Brand and Co., Mayfair Works, South Lambeth; Cadbury Bros., Bourneville, Birmingham; Killgerrm Co. L., 42, Caunce Street, Blackpool; Thomas and Taylor, Ltd.; Twyford, Ltd.; Hanley; Vance, M., 140, Stephen's Green; Walker, E., and Co., Heckmondwike, Yorks; Wells Fire Place Co., Newcastle; Willesden Paper and Canvas Co., 29, Commercial Buildings; Wilson, Charles, and Sons, Carlton Works, Armley, Leeds; Wright, J. and Co., Essex Works, Acton, Birmingham.

THE PUBLIC HEALTH CONGRESS.

VISIT OF DELEGATES TO BELFAST.

LORD MAYOR'S LUNCHEON.

A COMPANY of the delegates to the Public Health Congress paid a hurried visit to Belfast, on the invitation of the Lord Mayor (Alderman J. Henderson, J.P.) and the Lady Mayoress. They were met and cordially welcomed by the local reception committee, of which Alderman Bigger, M.D., Councillor Barklie, Dr. Whitaker (Medical Superintendent Officer of Health), Mr. David Henderson (the Lord Mayor's private secretary), and Mr. F. W. Money Penny were the most active members. Brakes were in waiting for the guests, who, having got seated, were driven to the Botanic Gardens Park, and others to the Ormeau Park, whose beauties just now are to be seen to advantage. The party then drove to the Fire Brigade Station in Chichester Street, where two turnouts were shown under Superintendent Parker. These were executed with the wonderful promptitude for which the fire corps has become celebrated, and the visitors, representing as they did various large municipalities across the Channel, frankly admitted that they had never before seen such a complete, well-equipped fire brigade organisation. The party then drove to the Queen's Island, where they had an opportunity of seeing in full operation the finest shipbuilding works in the kingdom, and in course of construction the steamship Oceanic, the longest vessel in the world, which, as the public are aware, is being built to the order of the White Star Company. The time at the disposal of the visitors at this great scene of busy industry was all too short, but they made the most of it, and departed amid the sound of the riveters' hammers, deeply impressed with all they had witnessed. They afterwards drove to the Grand Central Hotel, where they and a company of local friends were entertained to a sumptuous luncheon by the Lord Mayor.

HIGHLY satisfactory are the results which have accrued from the appointment of female sanitary inspectors in Liverpool, and especially useful is the work undertaken by them at this time of the year. When hot weather comes, there is generally a prevalence of diarrhoea, which is particularly fatal to children, and no doubt the fact that, as compared with the corresponding period of last year, the malady is not anything like so widely spread is due in a large measure to the useful information that has been given and the supervision kept over the poorer portion of the population by the five female inspectors. During their house-to-house visitation these inspectors have distributed a printed circular drawn up by the medical officer of health, in which the necessity for strict cleanliness in all things, how young children should be fed, and other matters of equal moment, are dealt with. With the object of still further extending this beneficial system, Dr. Hope has obtained the sanction of the authorities to engage three more female sanitary inspectors, and although at present the appointments are to be for a period of three months only, it is more than likely that ere long the Health Committee will see the necessity for permanently increasing their staff of female inspectors in that most important of departments.

Surveying and Sanitary Notes.

For some months past the question of dealing with the sewage of Bristol has been occupying the attention of a sub-committee of the Bristol Sanitary Authority, and the advice has been obtained of Mr. Santo Crimp, of the firm of Messrs. Taylor, Sons, and Santo Crimp, engineers, of Westminster. Mr. Santo Crimp's scheme is of a very comprehensive character, dealing with the whole question of sewage disposal, and freeing the river Avon from pollution. The plan provides for an outfall near Dunball Island, which has been chosen after a long series of experiments, and there will be tanks constructed at Avonmouth for storage purposes, so that the discharge may be effected at suitable states of the tide. A new sewer will be constructed following the course of the river on the Gloucestershire side, and a pumping station will have to be provided somewhere near the Clift House Estate, so as to lift the sewage into the outfall sewer, whence it will be conveyed to the Bristol Channel. It is in contemplation to extend the sewer up the valley of the Avon, and it has been suggested that it might be utilised for accommodating outlying districts if satisfactory arrangements can be concluded with the local authorities. Something has also been said as to an arrangement with the city of Bath, the authorities of which have been contemplating the provision of disposal works in the neighbourhood of Saltford. The suggestion is that in the event of an agreement being arrived at with the Bath Corporation, the Bristol sewer might be taken up sufficiently far to receive the Bath sewage, and thus render their disposal works unnecessary.

With regard to Bristol itself, the whole of the sewage now discharging into the Avon will be collected at a point near Clift House, and lifted by means of pumps into the new outfall sewer. The cost of the scheme will be between £300,000 and £400,000, and in its conception allowance has been made for the growth of the population for many years to come. It is said to be sufficient for a population of 500,000. The Council will probably be asked to sanction the promotion of a Bill in Parliament to carry out the proposed works, the execution of which will occupy about two years. It is considered too big a scheme to deal with under existing Acts, which provide for the repayment of the money borrowed within certain limits; and it is suggested that a special Act shall be obtained, and the repayment of the money spread over as long a period as possible, so that the present generation of ratepayers shall not be saddled with the whole of the cost. If the scheme is confirmed, it will be for the outlying authorities to approach Bristol, with the view of coming to an arrangement, the main object sought being, of course, to free the river Avon all the way down from sewage pollution.

Two matters of considerable importance engaged the attention of the Dorking Urban Council at their meeting on Thursday. In the first place, the proposed diversion of the Reigate Road by the County Council, which has been strongly opposed, was again under discussion. A special committee recommended the Council to adopt an alternative scheme, improving the present gradients and making provision for carrying away the storm water, which could be accomplished by diverting the old road by means of a loop road crossing the meadow belonging to the Hope Trustees, and forming a junction with the old road at a point about 88 yds. from the south end of Box Hill Bridge. This scheme, it is contended, will be economical, not costing more than £1500, will prove equally advantageous, and in addition will preserve the rural beauty of the spot. It remains to be seen whether this alternative proposal will commend itself to the County Council.

MUCH time was spent by the Council in discussing the serious question of the water supply. As time goes on, matters would seem to grow worse instead of better, and now the number of complaints is truly alarming. The Company at present are apparently unable to do anything to relieve the distress beyond promising an adequate supply shortly. Some strong remarks were made by members of the Council as to the way the Company had fulfilled their obligations, and opinion was unanimous that the Council should acquire the Company's rights. The outcome of the discussion was that the Council decided to write to the Company asking whether they were prepared to sell; if no answer be forthcoming in twenty-eight days, then steps will be taken to promote a Bill in Parliament during the coming Session.

With reference to statements that have appeared as to the Maidstone water supply, the Mayor of the borough (Mr. J. Barker), says he does not consider there was any cause for alarm in the town. Undoubtedly there was a scarcity of water, but there was no danger of anything like a water famine. It was only necessary that people should be economical. Mr. Barker went on to say that at the present time there were 3000 people outside the borough drinking water from one of the springs at Farleigh, which were cut off during the typhoid epidemic last year on the recommendation of the medical officer of health. Ewell Spring was not one of those which were proved to be contaminated, and the Town Council were about to consider the advisability of asking the water company to restore the supply derived from it. He was satisfied that the water company could not increase their supply by taking additional water from the Mid-Kent Company. At present the Maidstone Company could only get about 3000 gallons per hour from their neighbour, or a total of 60,000 or 70,000 gallons per day, whereas they originally guaranteed 100,000 gallons per day. Reminded that there was an impression in some quarters that some portion of Farleigh water was reaching the Maidstone consumers at the present time, the Mayor said, "Yes, there are some people in town who get Ewell water, but they don't know it. There is not the slightest doubt, I think, as to the purity of this water, but at the present time it is undergoing careful analysis, and the Town Council will have full results before them at their meeting on Wednesday next." The manager of the Maidstone Waterworks (Mr. Ware) states that Ewell Spring has been analysed fortnightly by Dr. Gregorys, the Company's analyst, during the past year, and it has maintained a uniform standard of purity. Barming Lunatic Asylum has been supplied from the spring throughout the year, also the inhabitants of Barming parish and East and West Farleigh. Notwithstanding this, doubt is expressed as to whether the medical officer for the borough will recommend the Corporation to ask for the restoration of the water, seeing that it was under suspicion at the time of the late typhoid epidemic.

It has been semi-officially intimated to the local authorities in East London who have charge of public baths and washhouses, and to the owners of large manufactories who are supplied by meter from the fire mains, that, unless rain falls plentifully shortly, the East London Waterworks Company will be compelled to shut down the supply. At the present time the Company are said to have water stored in their reservoirs sufficient to last for about 100 days on the shortened supply. As long as the drought exists the difficulties of the Company will continue, and, indeed, for some time after rain has fallen, as the Lea Valley is in a very parched condition. Above Hertford the Lea and its tributaries are fairly filled with water. Halfway between Hertford and Ware is the intake of the New River Company, below which the stream entirely disappears. Just above Ware the Lea is joined by a sewage stream, which causes a slight flow but greatly pollutes the river. The old bed of the river, which is now the celebrated Amwell Magna fishery, is drying up.

The East London Company have to depend for their supply upon the water brought down by the Stort and what escapes the New River intake, which is certainly not much, for, as Mr. Bryan pointed out to the deputation from Hackney which waited upon him on Tuesday, the New River Company take their full 22½ million gallons before the East London Company can take any.

FOLLOWING close on the present water famine in East London, and also at Maidstone, another water company has found itself in difficulties, and the South Essex Water Company have notified their consumers that the supply will have to be cut down at least for the present during the present drought. This will affect what is known as the Metropolitan area of Essex and the adjoining places, and the supply will now be cut short during the day, and only during the hours of 6 to 10 a.m. and 6 to 10 p.m. will it be supplied. This is not the first year the South Essex Water Company have had to reduce supplies, and around Romford and Forest Gate to Wanstead the effect will be keenly felt, those districts being almost as densely populated as the districts now covered by the East London Water Company.

THE new regulation of the East London Water Company restricting its water supply to two daily periods of about three hours would be a serious matter at any time; it is particularly serious in view of the hot weather. It may be granted that the Company has difficulties to contend with. The year's rainfall is short, and the East End Londoner is an improvident being who is not likely to be habitually careful in turning off his taps. On the other hand the Company has had fair warning, and plenty of it, as to what would happen in a dry season. So long ago as 1894 it obtained powers from Parliament to add to its reservoirs; still it finds itself in the same plight as it was in two years ago. When, therefore, all allowance has been made it seems impossible to acquit the Company of want of ordinary foresight. In consequence of that the public—who pay for a constant supply of water, but do not get it—will certainly suffer in their comfort and almost certainly in their health—a state of things which constitutes a very real evil.

WE are so accustomed to look upon London as being a city of bricks and mortar that the number of "lungs" with which the metropolis is studded is apt to be lost sight of. Probably the great majority of our readers will be astonished to learn that, excluding the open spaces owned by the Corporation and the Royal parks, the number of acres now open to Londoners is 6142, which is equivalent to just one acre for every 717 persons. Such an amount of breathing space is not possessed by any other town in the country. The beneficial influence they exercise on the health of the community may be judged from the fact that the death-rate in London is lower, with three exceptions, than that of any town numbering over 200,000 inhabitants in the United Kingdom.

SOME of the South London vestries have applied for provisional orders to enable them to arrange for supplying electricity in their neighbourhoods. Among them Newington stands prominent. This parish has not only secured its provisional order, but is erecting a general station for the installation of electric lighting in this district during the ensuing winter. The present scheme being undertaken by the Electric Lighting Committee of Newington, and directed by Mr. J. L. Dunham, the Vestry Clerk, will probably cost between £40,000 and £50,000. In the case of Bermondsey, the Parliamentary Committee refused to sanction the granting of a provisional order unless the Vestry consented to take over certain mains already laid down by an electric company, and the Vestry, it is said, intends to comply with this requirement in order to secure better lighting arrangements for this crowded and important industrial district of South London.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

THE object of the present series of articles is to direct attention to some important features appertaining to an art which frequently engages the professional attention of architects, and is also of direct personal interest to the community at large. Varying climatic conditions in this country render necessary considerable care in the design and installation of appliances, not only for the heating of air, but for its proper and scientific distribution.

Ventilation may be defined as the substitution of pure for vitiated air, so that a requisite standard of purity may be maintained in buildings of various kinds, and, although a familiar subject, it is one which seldom receives sufficient attention from those responsible for structural arrangements.

Existing examples of ventilation are more conspicuous in respect of variety than of success. Private dwellings, as a general rule, possess no means of ventilation, and many public buildings are provided with apparatus, apparently designed with the object of establishing such conditions as are most prejudicial to health and comfort.

yet in many cases the ratio is found to differ somewhat. Perhaps the clearest proof that air is simply a mixture is afforded by dissolving in water a small quantity of air, which, on being expelled by boiling, is found to contain 34·84 parts of oxygen to 65·16 parts of nitrogen. If the air had been a chemical compound it would have been dissolved as a whole, the expelled air showing on analysis the same constituent proportions as at first.

The law of gaseous diffusion, which is responsible for the uniform constitution of the atmosphere, is of great importance in ventilation, as it prevents gases from stratification in accordance with variations of specific gravity.

Thus noxious gases formed in rooms or buildings are gradually diffused over the whole body of air instead of accumulating in certain parts. By diffusion gases pass even through so impervious a substance as indiarubber, and carbonic acid gas (CO_2) rises to mix with hydrogen, although their relative densities are 1·5290 and 0·06926. The velocity of diffusion of gases is inversely proportional to the square of their densities, and directly proportional to the square root of their absolute temperature. Perfect diffusion is a matter of time, and in mines and wells it is frequently retarded so much that the air becomes dangerously charged with noxious gases.

In addition to oxygen and nitrogen, air contains in varying quantities, ozone, carbonic acid gas, or carbon dioxide (CO_2), carbonic oxide, or carbon monoxide (CO), vapour of

temperature of the air being at the same time noted by means of the barometer (c) and thermometer (d). Pure hydrogen gas in sufficient quantity to combine with all the oxygen present is now added, the volume and pressure being determined as before. The open end of the tube (a) is pressed against a disc of rubber at the bottom of the trough, and the

FIG. 1.

gases are ignited by the passage of an electric spark. The diminution in volume after the explosion represents exactly the volumes of oxygen and hydrogen which have united to form water, and one-third of this diminution represents exactly the volume of oxygen which was contained in the air examined.

Under the influence of electricity, oxygen undergoes modification, assuming an allotropic and condensed form known as ozone. Its properties are more active than those of ordinary oxygen, it arrests fermentation and possesses a distinctive odour.

Ozone exists in very minute quantities, about 1 in 140,000 being formed in nature by atmospheric electricity. It is absent in rooms and large towns, being changed by organic matter in air, and is chiefly found on the tops of hills and in forests. South-westerly wind usually contains a maximum quantity of this substance, and it is supposed to be one of the chief reasons for the health-giving qualities of country and sea air.

Nitrogen is probably the most inert of all the elements, and although it combines with hydrogen to form the pungent gas known as ammonia (NH_3) and with oxygen to form the base of the powerful corrosive and oxidising nitric acid. Its qualities when alone, or simply mixed with other gases, are strictly negative. Constituting about four-fifths by bulk of the air, nitrogen serves to dilute the oxygen and to modify its activity.

Argon, a recently-discovered element, also occurs in very small quantities, but as its qualities are even more inert than those of nitrogen, its presence need not be considered. The quantity of nitrogen present, including

FIG. 2.

In churches, notably, ventilating arrangements, borne with fortitude by a long-suffering people, usually create cold currents of air, which wander amongst the feet of the faithful and sweep down upon reverently uncovered heads, on many of which a few firm adherents alone remain of Nature's original protection.

Defective ventilation is generally the result of attempts, probably unpremeditated, to reverse the action of physical laws. If the latter, however, be treated with due consideration and respect, there is no reason why success should not be attained.

Before proceeding to discuss some of the chief methods adopted for the purpose of securing ventilation, it may be convenient to examine the constitution and characteristics of air, as well as the physical laws by which it is influenced under diverse conditions.

Air, once supposed to be an element, is now universally recognised to be a mixture, the two chief constituents of which occur in proportions which are practically uniform, whether the air examined be taken from tropical, temperate, or arctic regions, from deep mines or from elevations up to 20,000ft. above the sea level.

It may easily be demonstrated that air is not a chemical compound by bringing together oxygen and nitrogen in the proportions of twenty-one to seventy-nine parts by volume respectively. The resultant mixture possesses all the characteristics of air, and the absence of any alteration in either temperature or in bulk is a clear indication that chemical combination has not taken place. Again, the relative quantities of the two gases correspond neither to their combining weights nor to any simple multiples of them, and although the proportions of the gases are generally constant,

water (H_2O), ammonia gas (NH_3), carburetted hydrogen, floating particles of animal and vegetable matter, and micro-organisms. Sometimes, owing to local causes, other gases, alone or in combination, are also present.

Oxygen is the most important constituent of air, being absolutely essential to all animal life. By its action the blood is purified by de-carbonisation, and the natural heat of the body is thereby maintained. A diminution of three parts per cent. of oxygen in air is extremely prejudicial to health, and, on the other hand, an increase of two or three parts per cent. may cause fever, owing to the more rapid generation of bodily heat.

In order to ascertain the amount of oxygen contained in air, the eudiometer (Fig. 1) is, perhaps, the most convenient form of apparatus.

(a) is a graduated glass tube, open at one end and closed at the other, and through the glass at the top are inserted two platinum wires. The tube is first filled with mercury, and inserted into a trough (b) also containing mercury. A quantity of air is then introduced, sufficient to occupy about one-sixth part of the tube. The volume of air is then accurately observed, as also the height of the mercurial column above the trough, the pressure and

FIG. 3.

argon, in a given weight of air may be ascertained in the following manner:—A glass globe (Fig. 2), furnished with a stop-cock, is exhausted by an air pump, and weighed. A tube (b), fitted with copper turnings and fitted with stop-cocks, is also weighed. The tube is

heated to redness in a furnace (c), and connected at one end with the globe (a), and at the other with a series of tubes (d), containing caustic potash and sulphuric acid for removing carbonic acid and vapour. The cocks are opened and air is allowed to pass through the purifiers to the heated tube, where the copper removes the whole of the oxygen. Nitrogen thus passes into the empty globe, and when the experiment is concluded, both the tube and globe are again weighed. The increase in the weights of the tube and of the globe indicates the respective quantities of both oxygen and nitrogen.

Carbon dioxide, or carbonic acid gas (CO₂), occurs in a free state in the atmosphere, being evolved in large quantities from active volcanoes, from earth fissures in districts of extinct volcanic action, and in the process of fermentation. The quantity existing in open air varies from '03 to '06 per cent. by volume, whilst in dwelling rooms and buildings the percentage is considerably increased owing to

FIG. 4.

respiration and the burning of gas, &c. If the air of a room contains '10 per cent. of carbon dioxide, it becomes unfit for continued respiration, not only on account of the injurious effects of this gas, but because it is invariably accompanied by other deleterious compounds. The standard of practical purity may be taken as '04 per cent., and any system of ventilation, which is to be regarded as thoroughly efficient,

should prevent the accumulation of carbonic acid beyond '08 per cent.

Although non-poisonous itself, the presence of too large a proportion of carbon dioxide in the air is an indication that oxygen is deficient, and under such conditions respiration becomes impeded, and the nervous system is deranged.

It is, therefore, very desirable that architects and others who are responsible for the efficiency of ventilating arrangements should have at hand some ready means of testing the purity of air as indicated by the proportion of carbonic acid gas in public buildings. There are two convenient forms of apparatus for this purpose which may be mentioned. The first is shown in Fig. 3, where (a) is an inspirator, which by the flow of a measured volume of water from the upper to the lower vessel draws an equal volume of air through the tubes. (b) The first two tubes are charged with sulphuric acid to remove vapour, the next tube and bulbs are filled with caustic potash, which absorbs carbonic acid, and the last tube contains sulphuric acid to prevent loss of moisture from the potash solution in the bulbs. The quantity of carbonic acid is indicated by the increased weight of the potash tube and bulbs. The other apparatus, known as Dr. Scurfield's Ventilator Indicator, is indicated in Fig. 4, and renders possible an immediate estimate of the efficiency of ventilation without the trouble and delay involved in chemical analysis. (a) is an aspirator, filled with water and supplied with a gauge, surrounded by a number of tubes (b b), each containing an equal quantity of the same pink solution of baryta and phenolphthalein. Each tube can be in turn connected with the aspirator, so that a number of rooms may be tested consecutively. As the water is run off an equivalent volume of air passes through the pink solution, which loses its colour quickly or slowly according to the quantity of carbonic acid in the air. When decolorisation is complete, the amount of air passed is shown by the gauge on the aspirator. In operation one tube is first decolorised in open air, and the volume of air used is noted; the quantity of air required for decolorisation in each room tested is also observed. The differences give ratios from which the percentage of carbonic acid may easily be calculated on the assumption that outside air contains '04 per cent. of this gas. Although not minutely accurate from an analytical point of view, this instrument is extremely sensitive, and entirely reliable for all ordinary practical purposes, and might be used with considerable advantage in many public buildings, and especially in hospitals, as a check upon the operation of ventilating appliances. Carbonic oxide, or carbon monoxide (CO) is only found in the air under exceptional conditions, being produced when fuel is burned with a limited supply of oxygen. Some stoves, having slow draught, are apt to generate this gas, which is also frequently present in the fumes of burning charcoal. It is a most powerful poison, causing death when inhaled in small quantities. Two scientists who inhaled minute quantities of carbon monoxide suffered severely as a result of their investigations. One suffered loss of sensation, followed by sickness and pains all over the body, which continued for some days. The other experienced an attack of apoplexy, and was only restored with difficulty.

Trade and Craft.

MESSRS. BRAUN AND CO.—A CORRECTION.

We regret that an error should have occurred in the paragraph relating to the work of this firm at the Orwell Hotel, Felixtowe. The architect is Mr. J. S. Corder, of Ipswich.

THE vacillation of the Marylebone Vestry in regard to certain important works of wood paving should be a lesson to other local authorities, as will be observed from the proceedings at the last meeting of the Vestry, when the Works Committee reported that it had appeared to be impracticable to obtain suitable hard wood for the paving of Maida Vale in time for the work to be executed during the present season. Mr. W. Dennis, chairman of the Works Committee, explained that the Vestry were placed in an awkward position, and he desired instructions as to what the Committee should do in the matter. He had discussed the question with Mr. Waddington, the surveyor, in order that something tangible might be placed before the Vestry, as that was the last meeting prior to the summer vacation, and the surveyor had expressed himself in favour of obtaining either Jarrah or Jarrahdale wood. The speaker mentioned that the surveyor had applied to various firms in reference to the matter, and he asked and obtained permission for the surveyor to place before the Vestry the result of his inquiries. The surveyor then read letters from contractors, the substance being as follows: The Acme Wood Flooring Company stated, in reference to the inquiry as to the supply of 500,000 Jarrah blocks, that they would be happy to commence delivery late in September or early in October, and would be able to complete in November. Mr. Elliott, of Kentish Town, had telegraphed intimating that he thought he could deliver in September or October, and that he would send a definite reply on the following afternoon (the day of the Vestry meeting) or by Friday morning. In this connection the surveyor stated that no reply had been received up to that time. Messrs. McLean Bros. and Rigg wrote expressing the hope that the Vestry would be able to defer the work in order to enable them to supply their famous wood, Jarrahdale. The firm thought they could manage to "edge in" a ship for delivery in London at the end of January. Mr. W. Griffiths mentioned that in the event of orders being placed with him immediately, he could supply 250,000 blocks at the rate of 30,000 daily, and commence the delivery of the first half in September, and supply the remainder from a vessel early in October, at the rate of 50,000 per day. Millar's Karri and Jarrah Forests, Ltd, in a letter received that afternoon, expressed their willingness to commence delivery within a fortnight, so as to supply 250,000 in August and September, and 250,000 at the end of September. The latter added that the cost of wood blocks would be "very much less in January and February of next year."—After considerable discussion, it was resolved to authorise the Works Committee to at once obtain tenders and enter into contracts for the supply of hard wood blocks, so that the work of paving might be commenced early next year.

Property and Land Sales.

HAMPTON AND SONS,

ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON AND SONS beg to announce that their AUCTIONS OF LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C.

Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c. List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to HAMPTON AND SONS (Ltd.), 1, Cockspur-street, S.W.; or by post, three stamps. Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

SUSSEX.

SOUND LANDED INVESTMENTS.

SMALL SPORTING ESTATES, 13 FARMS, FULLY LICENSED INN, RICH MARSHES, WOODLANDS, ACCOMMODATION and BUILDING LAND, COTTAGES, &c., being the outlying portions of the Sussex Estates of Sir James Duke, Bart., and extending to about 2750 acres, divided into numerous lots. They comprise:

Magham Down and Cottages in Hailsham and Hurstmonceux.

Amberstone Farm, Accommodation and Building Land in Hailsham.

Hempstead Farm and Building Land in Hellingly.

The Whyly Estate, East Hoathly, a capital sporting property, with grand coverts.

Squire and Tuett's Farms, Framfield.

The Merry Harriers Inn and 16 acres, Cowbeech.

Cowbeech House and Farm.

Beech Hill Estate, about 390 acres, of which 84 are wood. One of the most complete little sporting properties in the county.

Clippingham Farm, Hurstmonceux.

Straight Ditch Marshes in Pevensey Level.

Sandhill and School Farms and Marshes, Hooe.

Holmush Farm, Hellingly, 83 acres.

Carter's Corner or Cowbeech Hill Farm, 46 acres.

Strood and Gatehouse Farms and Woodlands at Chiddingfold.

Swansbrook Wood.

West-street Farm, Hellingly.

All the lands are let at fair rentals and mostly to tenants of long standing, and offer a good opportunity for the sound investment of capital in an improving security.

Many of the properties have long frontages and could readily be sub-divided or developed, there being a large demand for small residences in the district.

HAMPTON AND SONS

Will SELL the above valuable estates by AUCTION, in numerous Lots, at the White Hart Hotel, Lewes, on TUESDAY, SEPTEMBER 6th, at THREE o'clock precisely (unless previously disposed of privately).

Particulars and Plans of the Vendor's Solicitors, Messrs. PONTIFEX, HEWITT, and PITT, 16, St. Andrew-street, Holborn-circus, E.C.; of Messrs. DRAWBRIDGE and ANSELL, Estate Agents, Hayward's Heath, Sussex; and of the Auctioneers, HAMPTON AND SONS LTD., 1, Cockspur-street, London, S.W.

OFFICES: 1, COCKSPUR-STREET, S.W.

MESSRS. E. and H. LUMLEY (Lumleys, of St. James's-house, 22, St. James's-street, London, S.W.) beg to announce the following days of SALE by AUCTION, at the Mart, Tokenhouse-yard, E.C.; but in addition other dates can be arranged for special sales. Terms on application.

Tuesday, Oct. 18 | Tuesday, Nov. 15 | Tuesday, Dec. 13
Messrs. E. and H. Lumley announce in the advertisement columns of The Times on Saturdays a complete list of their sales, which will include estates in England, Ireland, and Scotland, town and country properties, ground-rents, reversions, gas and water shares, stocks, &c. In cases where property is to be included ample notice should be given in order to insure due publicity.

—St. James's-house, No. 22, St. James's-street, S.W.

To Landowners.—The Instalment Mortgage System.

MESSRS. E. and H. LUMLEY, of St. James's-house, are prepared to undertake SALES by AUCTION (and Private Contract) of LANDS, Farms, Estates, and Properties generally on this novel, beneficial, and successful system. A descriptive pamphlet of Messrs. LUMLEYS, of St. James's-house, 22, St. James's-street, S.W.

Sales by Auction for the Autumn, 1898.—Messrs.

DEBENHAM, TEWSON, FARMER, and BRIDGEWATER

beg to announce that their AUTUMN SALES of ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Land, Ground Rents, Advowsons, Reversions, Stocks, Shares, and other Properties will be held at the Auction Mart, Tokenhouse-yard, near the Bank of England, in the City of London, as follows:—

Tuesday, Oct. 11. | Tuesday, Nov. 15.
Tuesday, Oct. 25. | Tuesday, Nov. 22.
Tuesday, Nov. 1. | Tuesday, Dec. 6.

By arrangement, Auctions can also be held on other days in town or country. Messrs. Debenham, Tewson, Farmer, and Bridgewater undertake Sales and Valuations for Probate and other purposes of Furniture, Pictures, Farming Stock, Timber, &c.

Detailed Lists of Investments, Estates, Sporting Quarters, Residences, Shops, and Business Premises, to be Let or Sold by private contract, are published on the 1st of each month, and can be obtained of Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER, Estate Agents, Surveyors, and Valuers, 80, Cheapside, London, E.C. Telephone No. 503, Bank.

Notice.—Some of the Properties advertised may be purchased by Private Contract before the Auction; substantial firm offers will be submitted for the vendor's consideration. All particulars are sent free of charge.—Messrs.

DEBENHAM, TEWSON, FARMER, and BRIDGEWATER

will be happy to place upon their books the names of those who wish to buy property of any description, and, on receipt of address, with a statement of the nature of the property required, the same will be entered in a classified Register, and particulars of all suitable properties will be sent (free of charge) for the current year.—80, Cheapside, London, E.C.

FOR SALE.

FREEHOLD.—SANDFORD-HOUSE and ESTATE, Godshill, I.W.

Six rail stations within one to four miles. Matchless beauty, splendid views and soil, mild climate, majestic, rare evergreen trees, &c.

Either as one property, or in portions, to suit buyers, viz.:

1. The HOUSE, with a beautiful cottage and any portion of gardens and grounds.

2. The FARM, with 60 acres good land, part adapted for building development.

3. The BUILDING LAND, skirting the High-road to Godshill.

4. The SEVEN perfect STONE COTTAGES.

5. The 12 ACRES of MARKET GARDENS, and several old and new orchards, &c.

6. The EIGHT GLASS FORCING HOUSES, splendid vineries, peach, tomato, cucumber, melon, and fig houses, &c.

7. The important matured NURSERIES, several acres of rare trees, shrubs, evergreens, &c.

(Nos. 5, 6, and 7 are all going concerns.)

Part of the purchase money may remain on mortgage. For particulars, &c., apply to Messrs. DOWSETT, KNIGHT, and Co., 3, Lincoln's-inn-fields, London, W.C.

Bournemouth.—To Gentlemen requiring a Seaside Residence, Architects, Builders, Investors, and Speculators.—Forty-four Plots of Valuable Freehold Building Land, suitable for good residences and a few shops. Also a magnificent Hotel Site of 1½ acres, and an unrivalled 17-acre Site, suitable for an institution, convalescent home, school, hydropathic, or other kindred purpose. Roads made and sewered, plentiful water supply, gravel and sand subsoil; high and healthy; on sea front, commanding magnificent views, amidst the loveliest scenery on South Coast. Twenty-one acres of Pleasure Grounds on the estate. Safe and profitable Freehold Investment.

MESSRS. SEGRAVE, BROWETT, and TAYLOR will SELL the above very choice and valuable FREEHOLD PLOTS of BUILDING LAND, situate on the Canford Cliffs Estate, West Bournemouth, in a Marquee on the Estate, on MONDAY, SEPTEMBER 5th. Free deeds. Payment by instalments. Immediate possession.

Cheap return tickets from London, 5s.; from Birmingham, 8s. Lunch provided.

Illustrated particulars, plans, and tickets of Messrs. SEGRAVE, BROWETT, and TAYLOR, Auctioneers and Land Agents, 9, Warwick-court, Holborn, W.C., and New Beckenham, Kent.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.

For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION,

personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

R. I. B. A., SOCIETY OF ARCHITECTS, and

CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PARTNERSHIP.—Young ARCHITECT

good London training, DESIRES WORKING PARTNERSHIP in established firm. Is an able designer and draughtsman, with good practical experience.—Address, ARCHITECT, care of J. E. Farrar, Esq., Solicitor, Halifax.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ARCHITECT'S ASSISTANT WANTED

at once to act as CLERK of WORKS. Thorough knowledge of materials essential. References required.—Apply, EDWIN O. SACHS, 11, Waterloo-place.

ARCHITECTURAL DRAUGHTSMAN

(experienced) WANTED, having knowledge of constructional ironwork. Aged about 26 years.—State experience and salary required to Box 416, Chronicle Office, Burton-on-Trent.

ASSISTANT (capable) WANTED. Well

up in public work, details, and quantities.—State age, experience, salary, &c., to P. T. RUNTON, Savile House, Hull.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A.,

DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.

G. SCORER, 28, Newman-street, W.

HOSPITALS and INFIRMARIES.—Expert confidential ASSISTANCE. Formerly draughtsman for Local Government Board; highly successful in competitions, for which moderate speculative terms are offered.—G. B., Caen Cottage, Ryde, I.W.

ADVERTISER desires RE-ENGAGEMENT in Architect's office. Having been out some time, would accept small salary to commence with. Country preferred.—C. H. LENTON, Clifton, Biggleswade.

CLERK, Timekeeper, or Assistant Clerk of Works.—Gentleman seeks RE-ENGAGEMENT. Practical knowledge of the Building Trade.—Apply, Box 813, Office of BUILDERS' JOURNAL.

A PRACTICAL SURVEYOR is open for ENGAGEMENT as SUPERINTENDENT. New buildings or alterations. Factories a speciality. Good references. Terms, &c., by letter.—SURVEYOR, Deptford Constitutional Club, 411, New Cross-road, S.E.

An Architectural Causerie.

Reigate's Turn. ARCHITECTS may come and architects may go, but the machinations

of municipal councils we have always with us. The latest of these candidates for distinction in the great comic history of architectural competitions is the Corporation of Reigate. One has always sympathised with little Reigate, and her late aggression ill becomes her. Picturesquely nestled under the slope of a great chalk ridge, and in the midst of the Garden of Surrey, she has long been beset on the one side by an historic and traditional rivalry with Dorking, in which she has well maintained her own importance and prestige; but now upon the other, at her very door, there has sprung up the great railway-begotten slums of Redhill, spreading over the fair countryside like a malignant growth, and threatening to overwhelm her dainty and particular atmosphere as of punch-bowls and great grandfathers, in a whirl of vulgarity and cheapness. Reigate considers itself the capital of Redhill, but little by little the urban dignities are attracted from the elder town to the newer and greater one, with accompanying outcry and protest, and it is no doubt in a wild endeavour to out-Redhill Redhill, that the Reigate Corporation have pretended to themselves that they are going to build "Municipal Buildings, fire station, police office, &c.," at a cost of £15,000. One says "pretended to themselves" advisedly, for a correspondent to a contemporary, whose word one has every reason to credit, states that the site is unsuitable and unpopular with the majority of the ratepayers. But if the ratepayers cannot bring themselves to agree to build them municipal offices and police and fire stations, at least they may be willing to enjoy the fact in imagination, and, as it is famous that architects are glad to engage themselves to supply designs for a few pounds only if—not one merely—but the whole Profession is invited, and have moreover shown themselves willing to supply unlimited designs for a small fee without requiring any explicit undertaking as to the use, destination, or execution of their designs, what consideration should there be to prevent the Reigate Town Council from spending fifty or a hundred pounds, and enjoying the satisfying delights of building in imagery, and that consciousness of a swelling municipal importance and aggrandisement which is attached to a popular imputation for costly building. Had any person been present who could have explained the unfairness of the demand the Council proposed to make upon the architects,

his representations could have been directly refuted by reference to scores of similar buildings to that projected, raised without protest, under precisely the same principles as those upon which the Council proposed to work. It is true that in the fact of their conditions the Council overreached themselves, and it is unlikely that they will receive any sound or serviceable sets of designs except they have recourse to a new issue of a revised set of conditions of competition. But this failure has been due, not to the precise requirements and undertakings of the conditions, but to the candour and the explicit wording in which

in other cases, it is true that the premiums of £50, £30, and £20 offered are a good deal lower than the average, such premiums being usually offered for designs of buildings costing not more than £10,000. On the other hand it has been shown that the average "conditions" enact that in 73 per cent. of competitions the premiated designs shall be the property of the promoters; that in 54 per cent. the promoters "are not bound to accept first award," and in 35 per cent. they are "not bound to accept first or any award." In fact, the only unusual feature in the Reigate conditions of competition would

Adel Church Interior looking East

A STROLLING SKETCH IN YORKSHIRE. ADEL CHURCH: INTERIOR, LOOKING EAST.
SKETCHED BY H. SYDNEY RHODES.

they were set down. Every year there are competitions wherein the intention of the Assessing Committee is similar in practically all particulars to that of Reigate, as their subsequent hedgings and explanations have very clearly proved; but they set the terms of the conditions of competition upon which the competitors are beguiled into contest in such vague and ambiguous language as admits of other plausible interpretations than the obvious one, although it does not deter the usual crowd of poor gulls who go like flies to the treacle whenever a competition is prepared for them. Comparing the Reigate conditions of competition with those issued

seem to be the clause which gives the Council right to withhold one or more of the premiums should they not be "merited." The marvellous and extraordinary quality in these proposals for competition of the Reigate Corporation, does not lie then in the affrontery of the promoters, who have merely acted in accordance with what they were entitled to believe was a just and proper precedent, but in the self-seeking of such architects who have fostered this irregular custom of competitions by their complete disregard of professional dignity wherever, and whenever, their own personal interests might for the moment be concerned.

B. C.

"Villas," Past and Present.

THERE is a kind of house, much in favour thirty years or so ago, which has of late years fallen on evil days. Not undeservedly have the stucco-fronted "villas" of the last generation gained so great a disfavour, for not infrequently the "compo." which covered their exterior, and made believe to be stone, hid exceedingly bad brickwork, while the planning left much to be desired. The suburban residence of that era is still much in evidence all round London, for the truth has not yet been sufficiently well rubbed into the minds of the owners of this class of property that this type of house has been a commercial failure. The kind was never really a success, and its utter ruin could be predicted by those who could see a little into the future so far back as twenty years ago. At that time Bedford Park was in the making. It was the fashion then to sneer at that "artistic colony," and many a commonplace person who lived in one of the poky little commonplace, stucco-fronted "villas," with those basement breakfast rooms that look so much like coal-cellars, would often issue forth to see the odd, red-brick houses that were rising from their foundations near Turnham Green railway station. It has now become quite difficult to believe that Bedford Park, which has set the fashion for the latter-day suburban house, was once regarded as one of the most curious things to be seen outside a museum, and that American magazines sent special correspondents over to these shores to write articles about it from personal observation. The music-halls even had comic songs about it, and we yet remember that there was one commencing

I took a little villa on the Bedford Park Estate,

which was by no means complimentary. Is there anyone now who considers that place so out of the common, now that the up-to-date builders of villas have followed its lead? We think not, for everywhere you may see the like, or even better. As Tennyson said of his poetry, "All can grow the flower, for all have got the seed," and just as better strains are produced from carefully cultivated seeds, so has the modern villa been rendered, often enough, superior even to its Bedford Park prototypes. Even the inartistic man who wants a house sees the advantages of the modern kind; just as one is advised over So-and-So's ketchup, or Somebody Else's soap, he "asks for it and will take no other." So it happened that the stuccoed basemented villas, a generation old, are everywhere "To Be Let." Explore, if you will, any London suburb, and you will find many streets of this class of house, built in the sixties and seventies, in which not only are more than half their houses empty, but the rest are let at diminished rentals. It is quite obvious from these facts that there must presently dawn a great suburban rebuilding era, for even though small property owners may hesitate before pulling down and rebuilding their houses, there must inevitably be a time when they can endure no longer to see no return on their outlay in tinkering their unprepossessing "desirable residences." In short, the time has, happily, passed when the Englishman is content to dwell, like his primeval troglodyte ancestors, underground. The suburban house with basements is an anachronism. Nobody wants it, and the house agent therefore tries in vain to let it. It cannot be conjured into anything less unpleasing, and as it cannot be mended it must be ended, and that soon. C. G. H.

THE REIGATE COMPETITION.

THOUGH the kindness of a correspondent, who has forwarded us a copy of the conditions of competition, we are enabled to reproduce them for the information of our readers. Our correspondent draws attention to several points, which are already dealt with in our leader; but he also points out that the Council seem to apprehend that some of the architects will refuse to compete under such conditions—witness the Borough Engineer's letter. The italics are ours. Our correspondent concludes his letter as follows:—"I consider the conditions impertinent; and, further, that any architect sending in a design under such conditions is giving his vote and influence to the degradation of himself and his professional brethren."

"ENGINEER AND SURVEYOR'S OFFICE,
"TOWN HALL, REDHILL, SURREY.

"DEAR SIR,—I enclose conditions of Competition as requested. *If you are willing to compete on the lines indicated*, I shall have much pleasure in transmitting you a lithographed plan of the site.

"I am, yours faithfully,
"W. H. PRESCOTT,
"Borough Surveyor."

PROPOSED MUNICIPAL BUILDINGS.

CONDITIONS OF COMPETITION.

"1. The Competition is to be an open one, and three designs will be selected and placed 1st, 2nd and 3rd in their order of merit.

"2. The premiums for the three designs which the Assessors shall consider best in order of their merit will be £50, £30, and £20.

"3. The awards of the Assessors shall be final and binding upon the Competitors, and there shall be no appeal therefrom.

"4. The Assessors do not bind themselves, in the event of only a small number competing, to give the three premiums before-mentioned, but only such as they may consider merited.

"5. The three designs to which the Assessors may award the premiums shall become the property of the Corporation and their authors shall have no further claim upon them.

"6. The Council do not guarantee to carry out any of the designs, and also reserve the right to modify, combine, alter, or amend any of the prize designs which they may think fit, and in the event of any designs being carried out, no further payment will be made to the author.

"7. Each drawing must be made to a scale of 8ft. to lin., and no other scale will be admitted.

"8. Each drawing shall consist of:—

"(a) A General Elevation.

"(b) General Section throughout Main Portion of Building.

"(c) Basement Plan. (Police Department.)

"(d) Ground Floor Plan (throughout).

"(e) First Floor Plan (throughout).

"9. The total amount to be spent upon the whole of the Buildings shall not exceed £15,000 (exclusive of the cost of fittings and furniture). Each competitor shall furnish an estimate of the cost of carrying out his design, and in making their awards the Assessors will be influenced by the practicability of the designs being carried out for the amount stated.

"10. Apart from the above conditions, the Assessors desire to give the utmost latitude as regards the design, &c., to the competitors. The Assessors would also point out and impress upon each competitor that the amount stated will not allow for any elaborate carving or other enrichments, but that first consideration should be given to the buildings being of a substantial and lasting character, and mouldings, if introduced at all, must be sparing and of a bold and simple design.

"11. Each design must be accompanied by a brief description, which shall not be in the competitor's own handwriting, and shall not exceed in length four pages of foolscap, and must be simply signed with the competitor's motto and device.

"12. All drawings must be stretched or mounted on mill-board with a neat border, and without being framed or glazed in any way.

"13. The drawings shall each be signed with a device and motto, and any drawing which shows any means of identification will be disqualified.

"14. The competitor's name and address shall be enclosed in a sealed envelope, which shall have on its outside the same device and motto as the drawings of the competitor, and this envelope must be enclosed and addressed to the Town Clerk, and endorsed on its upper left-hand corner, "Municipal Buildings."

"15. All drawings must be addressed to the Town Clerk, and delivered at his office not later than October 6th, 1898.

"16. A lithographed plan of the site can be obtained on application to the Borough Surveyor"

School of Art Wood-Carving.

WE are requested to state that the School of Art Wood-carving, which has hitherto been held in the Central Technical College, South Kensington, has now been removed to the Imperial Institute, in which rooms have been granted for the School's use. The School was re-opened after the usual summer vacation on Monday, September 5th. Free studentships in both the day and evening classes of the school are maintained by means of funds supplied by the City and Guilds Institute for the Advancement of Technical Education, and by the Drapers' Company. Some of these studentships are at present vacant, and forms of application for them, also information as to the school generally, may be obtained by letter addressed to the Manager, School of Art Wood-Carving, Imperial Institute, London, S.W.

It is proposed to build a Free Library at Gloucester, on land belonging to the Corporation. The probable cost is about £5000. Messrs. Waller and Son are the architects.

The old Militia Barracks at Bethnal Green are up for sale. They will probably be pulled down by the purchaser to make room for commodious business premises, and with them a noteworthy building will disappear.

The St. Pancras Vestry has notified that the portion of Euston Road from Gower Street to Cardington Street now paved with granite will be closed for six weeks for the purpose of relaying it with wood. This is a very much needed improvement.

The Great Western Railway Company have sanctioned the erection of the proposed Jubilee Memorial clock tower at the railway station approach, Maidenhead, and have approved of Mr. E. J. Shrewsbury's design for the memorial.

A PORTION of the Spinners' Arms, Shaw Road, Oldham, collapsed last week. The house is very old, and the owners were already engaged in the erection of a new building in front of the old one. It is supposed that the excavations for the new building were the cause of its fall. No one was injured.

The New Schultze Gunpowder Company Limited, of 28, Gresham Street, London, and of Fritham, Lyndhurst, manufacturers of explosives, have applied to the Hants County Council for their assent to the establishment of a factory for explosives on the premises known as the Ballast Hole, or Old Gravel Pit, at Rumbidge, Totton.

The work of roofing in the basement of the burned Metropolitan Tabernacle is being vigorously proceeded with, and the secretary of the Pastors' College hopes that, granted moderately fine weather, the new building will be ready for occupation at the end of October, and will provide accommodation for 1500 persons. The plans will be finally approved almost immediately, and, as soon as it is known what the approximate cost will be, an appeal to the public for financial assistance will be made.

STROLLING SKETCHES.

IN THE LEEDS DISTRICT.

BY HAROLD E. HENDERSON.

THE diligent student of Architecture may find much of interest in the Leeds district.

The Architectural Sketching Club of the local School of Art organises frequent expeditions of discovery during the summer months, and the accompanying illustrations are the record of several of these excursions.

At Whitkirk, six miles from smoky Leeds, the first halt was called. After admiring some very picturesque cottages with grey stone slates and rough cast walls composed of sand, ash dust, and "road scrapings," the party proceeded to the Church of St. Mary, nestling in the heart of the village. Built of sandstone of varied shades and colours, in some places beaten and battered by the rain and storm, at others coloured grey and green with lichen, with its sturdy western tower and lead spirelet its look rural and unpretentious, it is a typical Yorkshire church. Of Perpendicular date, it consists of nave, aisles, chancel, south porch and chapel. Inside the chapel and piercing the chancel wall is a capital alabaster tomb to Sir Robert Scargill and his lady, 1525 A.D., of Thorpe Hall. It is decorated on the sides with shields containing arms of the owner, and is under a canopy supported by two figures of angels. Among other interesting monuments is one erected by the Hon. Mrs. Meynell-Ingram in memory of Hugo Francis Meynell-Ingram, Esq. In the chancel is a mural tablet to the memory of John Smeaton, F.R.S., who was born at Austhorpe Lodge, 1724, and "departed this life" 1792. Smeaton was the celebrated engineer of Eddystone lighthouse. There is a very good pulpit of Caen stone of Perpendicular style, simple in design, yet not crude. Near the church is a very good house, partly covered with rough cast, with stone gables. The plan is of L shape, and the grouping of the different parts capital. On the front is a quaint little fire-bell, supported on iron scrolls and under a small wood canopy. About a mile from the church is Thorpe Stapleton, a small hamlet chiefly noted for the ruins of Thorpe Hall, a mansion of the fifteenth century, and formerly the residence of the Scargill family. Not much of the fabric is now standing.

The second excursion under notice was to the ancient village of Adel, four miles from Leeds, situate in the midst of breezy moors and charming scenery. Adel was the ancient

Roman "Burgodurum," and evidences of a Roman station have been found. Passing through the vicarage garden, where note was made of another of those quaint little bell turrets, we come to the Church of St. John the Baptist. Built in 1140, of local sandstone, in the Norman style, it is in excellent preservation, owing mainly to its sheltered position. The church consists of nave, chancel, south porch, and western bell turret. The beautiful chancel arch is supported on sandstone shafts, with caps of interlacing ornament. The orders of the arch are enriched with chevron and bird's-beak ornament. The south porch is one of the most magnificent in the country. It is of four orders of chevron and bird's-beak ornament, with nail-head label mold, supported on cylindrical shafts, with cushion caps of interlacing ornament. In the tympanum are the emblems of the four Evangelists, with an Agnus Dei in the apex. Fixed on the door is an ancient sanctuary ring, and many a thief has escaped justice by clutching the ring and claiming the protection of the church. The font is of ancient date on a modern base. The former stained east window, now removed to the vestry, is filled with armorial bearings of the Arthington family. In the chancel is a small memorial window to Thomas Kirke, of Cookridge, dated 1706. In the vestry is a very old oak chest. The church was restored by George E. Street in 1879, when a new pulpit and screen were introduced, and the roof raised to its original pitch.

We next visited Methley, a pretty little village about eight miles from Leeds. On our way to the church we looked over the old manor house, a sandstone building of Tudor style, with mullioned windows, deep and sturdy chimneys, and picturesque stone gables—a very good example of a Yorkshireman's country house. We then visited the Church of St. Oswald, of Late English and Decorated styles, built of sandstone of varied and beautiful colours. It consists of a spacious nave, chancel, aisles, with a chantry dedicated to the Waterton family; south porch and western embattled tower, with a fine octagonal spire. The Waterton chantry is separated from the aisles by an oak screen of Perpendicular date, with some very good carving and cresting well worth the notice of the architectural measurer. In the chantry are several fine tombs; one piercing the wall of the chancel, with a cusped and enriched canopy over, contains the effigies of Sir Robert Waterton and Cecely, his wife, both wearing collars of S.S. on either side. The sculpture in the panels on the side are very vigorous and well executed. Under the south window is a splendid alabaster tomb with effigies of Lionel VI., Baron Welles, who fell on the Lancastrian side at Towton, March 29th, 1461, and Cecely his wife, daughter

and sole heiress of Sir Robert Waterton. To a student of Gothic sculpture this tomb is unique, the drapery and enrichment of the figures and the series of conventionalised angels on the sides bearing shields with quarterings being incomparably splendid. There is a magnificent tomb to Sir John Savile, first Baron of the Exchequer, who died February 2nd, 1607, and whose heart only is buried here. The tomb is supported on Ionic columns of black marble, the sculpture of the effigies illustrating capably the transition from the Gothic to the Classic feeling. Another notable tomb is to Sir John Savile, first Earl of Mexborough, who died February 27th, 1778. On the wall are suspended several pieces of funeral armour, and the roof is panelled and

A STROLLING SKETCH IN YORKSHIRE.
BY HAROLD E. HENDERSON.

painted, but has been restored. There is a good Jacobean pulpit and font cover, well worth sketching.

The last of the visits for June was spent at Barwick-in-Elmet, an old-world looking place, with stone cottages with quaint doorways and gables, and several yellow-washed thatched cottages. In the centre of the village are the remains of the ancient market cross; near to is the vari-coloured maypole, where high rejoicings are held every year, a custom, sad to say, which is gradually falling away. The Church of All Saints is a large church, with a Perpendicular eastern tower built of two kinds of stone, the darker being sandstone, and the light limestone, coming from Jackdaws' Crag, and given by the Vavasours of the fifteenth century. A canopied niche in the tower contains a figure of Sir Henry Vavasour presenting the stone. The church is of all styles, and evidences of an earlier erection have been found. The west end walling is very early, being herring-bone in structure. The stone font is reproduced from the fragments of an older one found embedded in the floor of the nave. Opposite the south porch is a sundial dated 1765. To the west of the church are some very early earthworks, conjectured to be of Saxon origin, and assigned by some antiquaries to the seventh century. They consist of two enclosures, one of which is circular, and has within it a large mound; the other is much larger, and of a rectangular form.

ADEL CHURCH, YORKSHIRE: PORCH.

Jas. Neill.

RUINS OF MEDIAEVAL ENGLAND.*

By CHARLES HADFIELD.

(Continued from page 54.)

THE account of the opening ceremony at Canterbury Cathedral is a model for the special correspondent. After describing the blessing of the new fire and other ceremonies of the day, it concludes:—"At the door of the church, which opens to the martyrdom of S. Thomas, the Archbishop received from a monk with profound reverence the Blessed Eucharist in a pyx which was usually suspended over the high altar. This he bore to the great altar of the new choir. Thus our Lord Jesus Christ went before us into Galilee, that is, in our transmigration to the new church. The remainder of the offices that appertain to the day were very solemnly and devoutly celebrated. And then the Pontiff, mitred, standing at the altar, intoned the "Te Deum Laudamus," and the bells ringing, the convent took up the glad strain, and shedding tears of joy, loudly praised God with heart and voice for all His benefits." During this same year many interesting details are given—such as of the removal of the bodies of S. Odo and S. Wilfred, and their re-interment, and of the erection of a temporary wooden chapel for the reception of the shrine of S. Thomas. The funds for the prosecution of the works seem to have been largely subscribed by the crowds of pilgrims who visited the cathedral, for

record is made of two unusually wet seasons, when the works were stopped for want of money. I have, at the risk of tiring you, gone more fully into these details

IN THE CASE OF CANTERBURY, for the record is exceptionally complete and unique in that respect, brimful of interesting lifelike incidents and touches of human nature, that give so much charm and reality to the student. The fabric rolls of York and Ely Cathedrals give also a large insight into the building customs of the Middle Ages. It must be remembered that the cathedral chapters and monastic establishments were for over 400 years liberal employers of labour and patrons of the arts and crafts. Those bodies seem for the most part to have purchased their own materials and paid the wages of the craftsmen, thus limiting and safeguarding the employment of the middleman. When the crash came in the sixteenth century there was hardly a cathedral, important parish church, or abbey in the land where the great cranes on the summit of lofty walls and towers were not in evidence, and the ring of the hammer and click of the mason's chisel could not be heard. An earnest of the old German guild sentiment, "By hammer and hand all arts do stand." The work of the Reformation, inaugurated by the voluptuous Tudor despot, Henry VIII., and completed by his bastard daughter, "Good Queen Bess," destroyed those bulwarks against pauperism, the great monastic institutions, the never-failing shelter of the poor and helpless; and the crowd of minions and sycophants who fattened on the plunder, the patrimony of Christ's poor, inaugurated the reign of a poverty amongst the masses, which makes Great Britain to-day a bye-word throughout the nations. The learned Benedictine, Dom Francis Aidan Gasquet, in his "Henry VIII.

and the English Monasteries," shows on undeniable authority that so great was the crowd of destitute able-bodied men wanting work in the North of England on the final

SUPPRESSION OF THE MONASTERIES

that for one beggar in Henry VIII.'s time there were one hundred in the glorious days of Good Queen Bess. Quoting from an MS. preserved in B. Mus., Cole MS. XII, p. 41, of the funeral in 1591 of George, sixth Earl of Shrewsbury, the gaoler of Mary Stuart, who, with his fellow spoiler, George, fourth Earl, one of Henry VIII.'s accomplices in putting down the Pilgrimage of Grace, lies in the Shrewsbury Chapel of the Sheffield Parish Church, he records "that at the said funeral, in the twenty-third year of Elizabeth's reign, at Sheffield, in Yorkshire, they were, by the report of such as served the dole unto them, the number of 8000, and they thought that there were about as many more that could not be served through their unruliness. Yea! the press was so great that divers were slain and many hurt. And, further, it is reported of credible persons, that well estimated the number of the said beggars, that there were about 20,000." From this, says Dom Gasquet, "some idea may be formed of the great poverty, for it was thought that all the said poor people were abiding within thirty miles' compass of Sheffield, and that there were many more who could not go to receive the dole."

Here was the beginning of our modern system of Poor Law relief, one of the legacies of those days of Tudor tyranny when the liberties of the English masses, secured in the main by the efforts of the fearless Bishops of the Catholic Church, and for which those blessed martyrs, More and Fisher, died, were trampled ruthlessly under foot, to be restored after a fashion and given new lease of life by a Cromwell in the middle of the seventeenth century. The two great risings of the North, in which the gentry and peasants combined

IN DEFENCE OF THE MONASTIC INSTITUTIONS,

were stamped out in blood; and, for the benefit of the poorer and humbler sort of folk who clung to the old religion, it was enacted "that all Popish recusants who do not possess lands to the yearly value of twenty marks (the fine for hearing Mass), or goods and chattels above the yearly value of forty pounds, if they do not repair to the place in which they abide, or neglect to give in their names, or remove five miles away, then they shall be required to conform or abjure the realm—or in other words take an oath to depart out of the realm of England and all others the Queen's dominions—during the said Queen's pleasure." Mr. Edward Peacock's "English Church Furniture, Ornaments and Decorations at the period of the Reformation, as exhibited in a list of the goods destroyed in certain Lincolnshire churches, 1566; London: John Camden Hotton, Piccadilly, 1866," should be carefully perused by students. It is an account of the second destruction in Elizabeth's time, and shows that some of the churches were then comparatively rich, and in many cases filled with handsome accessories. I give one extract (Ab uno disce omnes): "Kilbie in the Pische of Haydor. Thomas Wells and Lambert Harrison, Church Wardens 8 April 1566.

1. Itm a vestment, a pair of censers and a stoole wch the said Thomas Wells bought this year and defacid it.
2. Itm a sopulker clothe—solde to Robert Harrie of the said pische this year by the above named Church wardens wch is defacid.
3. Itm a Rood Loft sold to Thomas Grene this year by the said Church wardens who hath defacid and broken it in peces.
4. Itm a sacring bell solde to Giles Harrie this year by the said Church wardens wch is defacid.
5. Itm II candell sticks, a holie water fatt, a pix, a sacring covering, II crosses and a crismatorie sold to James Lawe this year by the said Church wardens wch is broken in peces, defacid and put to profane use.
6. Itm the Rood Marie and Johnne, with a picture of S. Peter defacid and burned in the pnce of the pishoners yesterday being the

Thos. Saintpole.
&c. &c."

What *locus standi* can our Anglican friends have about their "continuity theory" in the face of evidence such as this? Mrs. Ella S. Armitage, in a clever handbook, "A Key to English Local Antiquities" (Sheffield, William Townsend; Bingley, Harrison and Sons, 1897), which I recommend to those who wish to follow this subject, observes that the money found for the alteration and erection of mediæval churches came by no means exclusively out of the pocket of the great land-owner. The principle of co-operation for a common end, which we find working at the very beginning of English Constitutional history, was made use of in religious matters also. Religious guilds, consisting of men and women alike, associations of pious persons, who provided out of their own means for various religious necessities, were commonly the munificent benefactors. Guilds of this kind often undertook the

REPAIR OR ENLARGEMENT OF CHURCHES,

the furnishing—supply of sacred vessels, vestments, &c. If their funds did not suffice, they frequently raised money by a "Church Ale," an institution which had many points of resemblance with a modern bazaar. The ale was brewed and given by the Guild members, and paid for by the general public, who gathered together to drink it—other innocent amusement being doubtless provided. At Rotherham, the Guild of the Holy Cross was an instance. There were also voluntary assessments made by parishioners for the buildings' fund. A perusal of old church and guild inventories that have come down to us will elicit evidence of an extraordinary richness and lavishness in the furniture and decorations of even small English country churches, the gold and silver chalices, studded with rare gems, the embroidered vestments and hangings, costly shrines, and the like, which were commented upon by a Venetian Ambassador to the Court of Henry VII., who remarks on them with astonishment and delight in a letter to his Republic. All those adornments were mostly executed for the buildings in a correct and artistic manner by local skilled craftsmen, and were not, as is too often the case in these later days, when the so-called Gothic revival has run its course, and fallen into disrepute amongst thinking men, purchased on the plea of cheapness from some factor or shopkeeper, yeleft an Ecclesiastical decorator, who buys them from abroad, where the

FASHIONABLE FURNITURE

in so many of our modern churches, &c., is manufactured wholesale by underpaid, underfed, and overworked men, women, and even children. I venture to ask both clergy and laity alike, who purchase this trash, if they are not degrading religious art by the encouragement of what, in plain language, is nothing more than "the sweating" of the handicraftsman, and the stifling of all artistic progress and culture. The present state of things did not exist in the early days of the Gothic revival, when the movement was controlled by Augustus Welby Pugin, a craftsman of craftsmen, whose scathing denunciation of the commercialising of art in his day are well remembered. In those far-off times the Catholics of England were to the fore in church building. Eastlake, in his history published in 1872, remarked on this, implying, as events have justified, that the fashion then setting in for so-called cheap "modern Gothic" churches, with showy exteriors, and interiors devoid of anything likely to arouse the sympathy of an educated artist, would place us

before the close of the century behind most other religious bodies in the knowledge and culture displayed in our buildings. My own idea is that if we cannot raise funds to build as they did in the forties, we had far better call for solid, plain structures like the chapels of the first quarter of the century, filling them with interesting and thoughtfully designed fittings devised for the surroundings. The great crux of the modern craftsman is the wretched shibboleth as to style, which the British public seems determined to cling to when Continental nations will have little or none of it.

A TECHNICAL school is about to be erected at Bournemouth. Messrs. Creeke, Gifford and Cakeley, of Bournemouth, are the architects.

A NEW Church Mission-room has been erected at Warley. The building, which is of iron, consists of a small chancel and vestry, and is capable of seating 200 persons. The total cost, including the site, was about £350.

A NEW day school is in course of erection at Preston. The building will consist of one large room, an infants' room, and a cloak room. The architect is Mr. H. E. Peach, of Southport, and the work has been entrusted to Mr. Smith, of Croston. The school is expected to be finished about the end of November, and is estimated to cost £600.

THE old town hall, Henley, has been sold, as a new building is about to be erected. The town hall was built in 1796 by Mr. William Bradshaw. Possession for the purpose of pulling down and clearing the site will be given on September 12, and the whole is to be absolutely cleared on October 8.

RICHMOND HILL.

AN UNIQUE VIEW THREATENED.

AN appeal issued by the Mayor of Richmond for the sum of £4000 with which to purchase Glover's Island for the benefit of the inhabitants of the town, has resulted in the very small sum of £50 being received. The appeal was made with the object of preventing the possibility of the island being sold and used for advertising purposes, in which event the unique view from Richmond Hill would be seriously affected. In conversation with a Press representative the Mayor said he was exceedingly disappointed at the apathy displayed by his fellow townsmen in not taking measures to prevent the island falling into the hands of speculators who would either erect some building or cover it with advertisement boardings. Only that morning he had received a telegram from a wealthy and prominent resident of Richmond Hill, to whom he had applied for assistance, and whose residence overlooked Glover's Island. The gentleman, who was on the Continent, stated that he did not care what became of the island, as he had no interest in it. Some of his (the Mayor's) colleagues on the Town Council appeared to think he was asking a price far in excess of what the island was worth. As so much dissatisfaction had been expressed as to the disposal of the property, he had decided to leave the whole question as to the proposed acquisition of the island to the Amenities Committee of the Corporation, who would draw up a report on the matter.

MEDIEVAL TIMBER ROOFS: KNAPTON CHURCH, NORFOLK.

REPRODUCED FROM A TRACING.

WESTMINSTER
HALL

MEDIAEVAL TIMBER ROOFS.*

BY D. M'LEOD CRAIK.

MANY buildings have double ranges of hammer-beams, whose object is to further stiffen the principals, and bring all the strains on to the lower range and from thence directly to the wall; they are usually employed in roofs of low pitch.

Hammer-beam roofs are always double framed; they are divided into several classes:—First, those with hammers, collars, and struts, connected with curved braces; a good example, Little Welnetham Church, Suffolk. Secondly, roofs with collars omitted and the curved braces carried up almost to the ridge and framed into a wedge-shaped strut at the apex of the arch, into which the principals are also tenoned. Example: Nave, Trunch Church, Norfolk. Third, those with collars, and no struts, as at St. Mary's Church, Suffolk; and, fourth, roofs without either collars or struts, as in Palgrave Church, Suffolk, where the arched brace is formed of three pieces of timber about 3in. thick, one on either side tenoned into the hammer-beam and principal, and reaching up as far as the purlin, the centre-piece forming the apex of the arch, being tenoned into each principal, and itself acting as a brace, and at the same time, to a certain extent, as a collar.

Roofs with collars usually had the braces in four pieces, two uniting the hammer-beams with the lower half of the principals, and the other two connecting the upper halves with the collar-beam.

It is very seldom that a hammer-beam roof has a steeper pitch than 87°.

In the south aisle, Outwell Church, Norfolk, a roof occurs without wall-pieces or braces—the projection of the hammer-beam is very slight, with no support underneath.

At St. Peter's, Moncroft Church, Norwich, the cornice is brought forward to the ends of the hammer-beams, and wooden arched ribs spring from the supports of the wall pieces to its underside, forming a sort of fan growing round the hammer-beam braces, which contributes greatly to the beauty of the roof, although some people condemn it because the idea seems to have been derived from fan tracery, a stone construction, but surely this

is mere faddism, as there appears to be no imitation of stonework intended.

In roofs of a late period, the difficulty of too great a space between the main trusses was overcome by the introduction of intermediate trusses without hammer-beams, as at Little Welnetham Church, Suffolk, or by retaining the hammers, but diminishing the depth of the braces and wall pieces beneath them. They were usually placed over the apex of the nave arches, or over the piers between the clerestory windows.

These intermediate trusses produced such a

pleasing variety in the design, and avoided the monotony of a long succession of hammer-beams, that they were often introduced for effect alone, as at St. Mary's Church, Bury St. Edmunds, Suffolk, a specimen of mediæval Architecture scarcely to be surpassed by any other in the land. Span 26ft., rise about 12ft.; the angels on the hammer-beams and in the cornice are exquisitely carved.

The magnificent roof of Westminster Hall (1397) is one of the earliest known examples of the hammer-beam roof, which was not in general use until late in the fifteenth century. In roofs of large span, main arches of timber were employed, as at Westminster, springing from the bottom of the wall pieces, and reaching to the underside of the collars; the hammer-beams and struts run through this, and their braces complete the form of a tre-foiled arch; the main purlins over the strut are upheld with the collar-beam by an intermediate rafter of great strength. The roof, notwithstanding its enormous span (68ft.) is of an extremely simple construction, the whole pressure being carried by the straight lines of the principal rafter and curved brace, directly into the solid wall. My sketch of this roof is enlarged from a small drawing, and is only intended to convey an idea of the construction and general effect.

The arch also occurs in Beddington, Surrey, in the beautiful Hall roof—span 19ft. 6in.

The early examples of hammer-beam roofs differ from the later in the thickness of their carved braces. In the former they are generally the same breadth as the principals, but in the latter seldom more than 3in. or 4in. thick.

The hammer-beams were often beautifully carved to represent angels, which appear to be holding up the roof, as at Wymondham Church. Demi-angels, with outspread wings, and clasping escutcheons to their breasts, were nearly always affixed to the ends of the hammer-beams. In a roof where they are so numerous as in Knapton Church, it would require very little stretch of the imagination to conceive a Heavenly Host hovering overhead. Most of the palace and hall roofs that remain are hammer-beam trusses. The splendid example at Hampton Court, 40ft. span, bids

KNAPTON CHURCH NORFOLK. ROOF OF NAVE.

* A paper read before the Edinburgh Architectural Society. Continued from page 52.

STARSTON CHURCH, NORFOLK.

ST. MARY MAGDALEN'S CHURCH, PULHAM.

fair to rival even Westminster. It is one of the most elaborate in the country, the whole roof being covered with panelling, rich carving, coats of arms, and tracery employed to fill up all spaces. It consists of hammer-beams with curved braces, struts, and collar-beam, supported by braces which form a four-centred arch; the spandrils filled in with tracery, as well as the space between the collar and ridge, which is supported by a post. The trusses are connected by arches, which spring from the ends of the hammer-beams, and form in reality a small duplicate of the main truss. From the ends of all the hammers hang richly crocheted pendants.

The roof of Melton Abbey, Dorset, is extremely fine, great charm and variety being caused by the introduction of a very beautiful intermediate truss.

Other good examples occur at Bramhall and Arlington, Cheshire, the former a tie-beam truss and the latter sheeted, and panelled with ribs as high as the collar.

At Penshurst is an example of a trussed rafter roof. There are also beautiful roofs at Eltham Palace and Croydon.

Braced roofs are a simplification of the hammer-beam roof, instances of which occur without struts or collars; and so having proved by experiment that these could be done without, the hammer-beam itself was next omitted.

There are two varieties—those with collar-beam, and the other without.

At Brinton the wall piece is tenoned into the underside of the principal rafter, the foot of which is also connected with it by means of a horizontal piece of timber, which we will call a wall beam; the arched braces, which terminate rather abruptly, securely bind the main timbers together. This roof bears a considerable resemblance to a Decorated roof nearly a century earlier at Tunstead Church.

A beautiful example of a collar-braced roof occurs at St. Mary Magdalen's Church, Pulham, Norfolk. The form of the arch is extremely graceful, the timbers are effectively moulded, the purlins and cornice surmounted by a cresting of strawberry leaves, the collar-beam is enriched by an embattled moulding, as are also the lower members of the cornice, which has a double range of angels and flowers alternately, and their positions in the second row counter-changed; the spandrils above the collar are filled in with tracery.

The nave roof, Starston Church, Norfolk, is a good instance of an arch-braced roof, and shows the method of framing braces at the apex of the arch when the collar-beam is omitted. A strut 9in. square hangs down 2ft. from the summit of the principals, which are framed and pinned into it, so as to prevent it from dropping, sometimes it was wedge-shaped; mortises are cut in the four sides, into two of which the main arch braces are tenoned, and arched ridge-braces are received by the other two. By this manner of construction it is almost impossible for the roof to spread outwards, or to rack from east to west, as sometimes happened in trussed roofs, where no lateral connection existed. The underside of this strut is finished with a boldly carved

flower. The cornice is framed in lengths between the wall pieces, the struts and wall-beams of the common rafters being tenoned and pinned into it.

Old Basing Church, Hants, presents a curious example, the braces do not meet at the summit of the principals, but after describing a four-centred arch the curved braces themselves meet together, and the ends crossing, continue with an inverted curve up to the principals into which they are tenoned. These braces are almost as thick as the rafters; there are two rows of purlins with purlin braces, and the appearance of the roof has a very good effect.

Curved braces, besides binding the timbers together, serve two highly important purposes; first, in conveying the thrust or strain of the roof lower down on the walls, where they offer a greater resistance to lateral pressure; secondly, they serve to steady the walls, this being the more important part of their duties, for they occur in tie-beam roofs, or flat late perpendicular ones, where there is no outward thrust, and although the braces are a great support to the massive beams, yet together with them they greatly strengthen the walls, which is very necessary when it is remembered how much they are weakened by the enormous clerestories.

The absence of the ridge-roll, and the position of the ridge-piece, which rather served the purpose of a purlin than an abutment for the rafters (they being halved and pinned together above it), is a very marked characteristic of mediæval construction.

Aisle roofs are for the most part of the lean-to order, the earliest examples being merely a continuation of the nave rafters; but the introduction of clerestories necessitated a distinct roof, generally of a flat pitch, in order to leave as much space as possible in the nave wall for light.

The construction was very simple; principal rafters resting on plates at each end, the upper supported by corbels, or let into the nave wall, and the lower resting on the external wall. Wall-pieces are tenoned into the principal at its head and foot, and curved braces spring from these, and meet in the centre of the roof, as at North Walsham Church, Norfolk; or else, gradually dying into the soffit of the principal, form a flat arch, as at Ixworth Church, Suffolk; the spandrils in both instances are filled in with tracery.

A purlin is usually framed into the principals to support the rafters, and, where necessary, intermediate trusses are used, the mouldings in most cases mitreing with those of the purlin.

In nearly all instances the whole of the timbers were beautifully moulded, as well as the bosses exquisitely carved, these roofs being so much nearer the eye than those of the nave; the lower cornices were the more enriched for the same reason.

Aisles very rarely have gabled roofs, and then only of low pitch if clerestories exist; they nearly always occur over the south aisle, this being considered the more important.

As stated at the commencement, colour

played an important part in the decorative splendour of Mediæval roofs, as it also did in connection with the rest of the building, at a time when our churches glowed from floor to summit in all the glory of bright colour and gilding.

It may be taken as an invariable rule that where stained glass occurs, the rest of the building was coloured.

Roofs were subjected to a variety of treatments, some being coloured altogether, but the general practice was only to tint the mouldings and carvings. In flat roofs the panels were frequently painted blue, powdered with gold stars (in the centres of which small mirrors were sometimes introduced, and so caused them to twinkle), as in the Clopton Chantry, Long Melford Church, Suffolk, the rafters being painted red, with scrolls bearing texts on their soffits, as well as on the cornice. Between the feet of the rafters in the cornice are shields emblazoned with the arms of the family, a common and very effective use of colour. The beads in the ridge and cornice are coloured red, with a gilt leaf twisted round them spirally, this being the usual mode of colouring beads in all woodwork, the colours varying, but always in spiral bands, black and white are most common.

At Palgrave Church a rich and pleasing effect is produced by means of few colours, namely, black and white on a red ground.

In the drawing of Knapton Church I have attempted to give you some idea of the effect of a roof in the full blaze of its original colour, which this exquisite example fortunately retains, together with the best part of its carved enrichments, the angels at the foot of the wall pieces being the only ones missing. There is a tradition that this roof was saved from a wreck, which has some appearance of truth, in so much as it seems much too elaborate and costly for the rest of the building. The wood is entirely concealed by colour, which is of rare occurrence.

In the eastern bay of St. Mary Magdalen's, Pulham, the spaces between the principals are boarded under the common rafters, subdivided into panels which are coloured all over, the emblems of the Evangelists being painted in them. Only the ornamental portions, carvings, mouldings, &c., of the remainder of the roof were coloured.

This enrichment of the portion of the roof over the altar was generally observed. It sometimes consisted of the whole of the chancel, but often only of a couple of bays.

The importance of colour to accentuate mouldings at a great height, and for giving prominence to carving and heraldic devices, cannot very well be over-estimated, as these bright touches of colour would do much to enliven the general sombreness of modern churches, and greatly enhance their charm.

It will be noticed that my remarks have been wholly confined to English examples, no Scottish roofs being mentioned. That there are some worthy of notice I have not the least doubt, and I sincerely hope that the members of the Society will take pity on my ignorance, and in the discussion supplement this paper by the addition of local examples, which always add such an amount of interest to a subject of this kind that distant illustrations fail to convey.

A STATION hotel costing £4000 is to be erected by the South-Eastern Railway Company at Whitehall, Crayford, for the accommodation of the men employed at the engine works.

MESSES. G. AND R. COUSIN, contractors, Alloa, have been successful in securing the contract for a large addition to the Waverley Station Hotel, Edinburgh. The estimated cost is stated at between £50,000 and £60,000.

THE River Wear Commissioners of Sunderland have adopted a scheme for quay and dock extensions to cost £261,000. This is in addition to the works in progress, which raises the total cost to £375,000. The object is to provide accommodation for the large steamers which are now being generally ordered by shipowners.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

September 7th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It is thirty-five years since Mr. G. A. Storey (made A.R.A. in 1876) went on a tour to Spain. Eleven years earlier he had exhibited his first picture at the Academy. His reminiscences of the Spanish trip, including descriptions of the native artist life with which he came in contact, and characteristics of town and country life in Spain, will be found in his "Sketches from Memory," a volume which Messrs. Chatto and Windus will publish in about three months. Among the London memories will be those of his student days in Mr. Leigh's school, Newman Street, where he began to study in 1850. Mr. Storey's early training was received in Paris, of which city his book records various warlike memories. The book also contains anecdotes about Dickens, and interesting details about the Landseers, the Pre-Raphaelites, and the Royal Academy forty-five years ago.

The walls of the National Gallery have just received some interesting accessions. These are three new Romneys and two very pleasing portraits by Sir W. Beechey. Of the Romneys, one is a lovely portrait sketch of Lady Hamilton; another, a lady and child; and the third, a portrait of Lady Craven, afterwards the Margravine of Anspach. This last is presented to the Gallery by Colonel the Hon. F. W. Stopford. The other two Romneys were bequeathed to the nation by the late General John Julius Johnstone, together with the two family portraits by Beechey. Room 18, in which the Romneys have been placed, has now been rearranged, and looks exceedingly well, containing, as it does, so fine a collection of pictures by Reynolds, Gainsborough, and Romney.

THOUGH we are to have an exhibition of works by the old masters at the Academy in January, it must not be taken for granted that the series will continue. On the contrary, all that has been settled is the character of the next show, and that chiefly as a matter of compromise. It takes a much longer time to organise an exhibition of one master's works than to choose from many collections the desirable or interesting works of several painters. To follow in the old groove was the shortest way out of a difficulty, and counsels were very far from unanimous on the course actually decided on. Nothing really has been settled except that for 1899 there will be old masters at the Winter Exhibition. The opposition to this scheme was so determined, and numerically so important, that we certainly have not heard the last of the question.

ONE of the rare cool places now is the ground floor of the Louvre. That part of the palace is devoted to sculpture. Few strangers go there, and the Sunday crowd never. One need not go to Gizeh to see the rarest specimens of antique Egyptian art. There are ground-floor rooms here filled with them. The Renaissance rooms are of great interest. France had assimilated Italian art, and given it a new and distinct character. The many-

sided genius of Jean Goujon best expresses that period. A new gallery devoted to modern French sculpture has been opened on the ground floor. Among its treasures are a bust in terra-cotta by Corpeaux, a bust of Houdon's little daughter, by her father, some sixteenth century statues that have come from the old Chateau de Chantilly in the Allier, a twelfth century Christ on the Cross, a Ste. Genevieve in stone which decorated the portal of the abbey church called after her and has lain for years in a lumber room of the Henri IV. College, a Head of Christ in painted stone of the fifteenth century, and a bas-relief representing Faith, Hope, and Charity. This is supposed to have been done for Margaret de Valois, Queen of Navarre, by an Italian artist who probably worked for her brother Francis. This room impresses one with the sociable genius of French modern art.

Nor content with the laurels she has gathered on the stage, Madame Bernhardt has pursued other walks of Art with remarkable success. In 1869 M. Mathieu-Meusnier induced her to sit to him for a bust. She attentively watched the process, and criticised the result with so much taste that the sculptor recommended her to make an essay in his art. That very night, on her return from the theatre, she adopted his suggestion—a relative, Madame Bruck, being awakened from a sweet sleep to pose as a model. In the result the young actress became an enthusiastic votary of sculpture, and her first serious work in this direction, a marble bust of a young girl, was exhibited in the Salon of 1873. Next came a bust of a younger sister, who did not live to witness its completion. But it was not until Madame Bernhardt exhibited "Après la Tempête" that her cleverness as a sculptor was fully evinced. The subject is maternal grief: an aged woman, bereft of reason by accumulated misfortunes, gazes at the dead body of an only son, refusing to believe that he is not alive, yet with a glimmering consciousness of the truth expressed in her withered face. The group is pathetic in a very high degree. Madame Bernhardt has also executed, among other things, a bust of Emile de Girardin, and a colossal statue for the façade of the theatre at Monaco. Nor is she a stranger to the palette; a striking picture of Medes slaying the children has come from her easel.

A NEW use for petroleum has been discovered in America. The tracks of the Pennsylvania Railway are sprinkled with it, and the trains between Philadelphia and Atlantic City are no longer accompanied by the clouds of sand and dust that suffocated the passengers and converted them into effigies of millers. Have we no room for this device in England? The Kingston Road, for instance, is, as the Vicar admitted the other day, a "perfect Sahara" on Sundays; but, for Sabbatarian reasons, the local authorities decline to remove the nuisance. How would it do to experiment with petroleum? The sprinkling of water, as is well known, greatly increases the dustiness of a road as soon as it has dried; for it separates the finer particles of sand and dust from the hard substratum of the roadway. Oil, on the other hand, has a permanent clogging effect. In London streets, desirable as it might seem to discover some means of suppressing the clouds of powdered filth that are whirled into our eyes at street-corners in dry seasons, oil might be unsuitable.

WE believe that it is not only under consideration to make improvements in the Keeper's house, but also to make some addition to the buildings of the Academy itself. There is ground in its possession that can be utilised for the purpose. It has not yet been settled whether another room shall be added to the existing galleries, or whether the addition shall be merely of offices of which there is felt to be great need.

AN important step towards the establishment, near London, of a Wagner Memorial Theatre has been taken by Mr. Schulz-Curtius. In a circular issued to the Wag-

nerian English musical public he expresses the opinion that an ideal site for a theatre built after the Bayreuth plan would be Richmond Hill, with Richmond Park as a background, and the Thames Valley spreading beneath, but he has no desire to force this view upon any committee of artists and men of business that may be constituted. He invites communications on the subject from his patrons, and with the intention of bringing the matter to a practical issue, encloses forms for subscriptions to any workable scheme that may eventually be submitted. The sum likely to be required for the erection of the theatre would be from £50,000 to £100,000.

A LIVELY inquiry has been held at Bourne-mouth by Mr. A. E. Sandford Fawcett, Local Government Board Inspector, respecting an application of the Town Council to borrow £1000 in order to transform the course of the stream in the well-known lower pleasure gardens into an ornamental water-course, with islet, grottoes, ferneries, weirs and a rustic bridge. The proposal is looked upon with great disfavour by many ratepayers, who offered strenuous opposition. Mr. Wall Richards, formerly of Birmingham, said that to talk of improving the beautiful gardens was like painting a butterfly. There were only two inches of water now in the stream, and where would the fishponds and cascades come from? In time of flood the fancy grottoes and rockeries would be swept into the sea if the stream was corkscrewed. The decision of the Local Government Board is awaited with considerable interest.

THE "Golden Cross" Hotel at Charing Cross, which has just emerged from the hands of the builders, after being entirely reconstructed, stands some distance to the east of the historic "Golden Cross" Inn, at the door of which Mr. Pickwick had the ever memorable encounter with the philosophic cabby. At that time it was a well-known coaching hotel, and was called "The Bull and Mouth of the West." Until late in the last century a signpost and a water-trough, which were familiar features of all such hostleries, might have been seen in front of this famous inn.

LONDON is an amazing jumble of long streets, short streets, broad streets, and narrow streets; but the shortest, if not the narrowest, is John Street, S.W. A Daily Mail representative's measurement of the length of that imposing thoroughfare is 26yds. The directory of John Street begins at No. 1—and ends there. The house is occupied by the architect to the Duke of Norfolk; and it is seldom that his letters miscarry, as the postman would have some difficulty in leaving them at the wrong number. That is the advantage of having one-house streets. The whole of the other side of the thoroughfare is occupied by Ye Olde Bell Hotel. It is said to be 400 years old. The house, however, fronts Pall Mall, and is included in the numbering of that home of fashionable clubs.

A FEW days ago it was very generally reported that the happy hunting ground of the Italian colony in Saffron Hill was threatened in connection with a street improvement, and that a year or two would suffice to bring about the complete transformation of a part of London almost entirely given over to the stranger within our gates. Inquiries we have made, however, show that this is not altogether correct. It is possible that changes will take place in the near future but, if so, they will be initiated by private enterprise, and will not involve nearly so comprehensive a scheme of clearance as that foreshadowed. For some little while the district has been enjoying the attention of a few speculators, and now a syndicate is on the point of commencing operations of a development on a somewhat ambitious scale.

GUILDFORD hardly seems to offer a congenial sphere of labour for an architect with up-to-date ideas in the matter of church decoration. This, at any rate, is one of the

morals to be drawn from the interesting proceedings at Holy Trinity Vestry meeting. In lieu of painting the walls, in connection with the urgently-needed cleaning and re-decoration now being carried out, the architect, Mr. A. H. Powell, had the "happy thought" of employing in part a paper of a green shade and in part a pattern described as "carpet brown." The effect would have been novel and artistic, no doubt, but news of his intentions no sooner spread than revolt began, and the emphatic opposition evidenced no doubt only voiced the deeply-felt indignation of the vast majority of the congregation. Holy Trinity with a garb of brown paper to hide the nakedness of its walls would cease to be Holy Trinity in the eyes of many worthy folk; and even the most unsympathetic critic must confess to some difficulty in reconciling such a development with the sober classicism of the new chancel. Mr. Powell's modernism was, in fact, effectually sat upon, and the vestrymen returned home with the satisfaction of knowing that they had triumphantly accomplished their purpose.

PAST finding out are the ways of Vestry Paving Committees. After all these years of experiment they have not yet decided upon one uniform kind of paving for London streets, says a contemporary supporting our view of a week or two ago. The consequence is that in a comparatively short drive one may come upon wood, macadam, asphalt, and granite setts. Nor do they seem able to agree upon a definite plan of campaign, so as to avoid having two parallel main thoroughfares "up" at the same time. At the present moment, when the Strand is absolutely impassable, half Holborn is in the hands of the excavators, and we should not be surprised if an excuse were found to dig up the Embankment also. To such vagaries we have grown accustomed. But at least it might have been expected that the Strand authorities, having decided to repave, would have chosen the most lasting wood for the purpose. Years ago a small portion of the roadway was laid with some species of Australian wood. The experiment answered admirably. Will it be believed, then, that the Strand Vestry has actually reverted to the use of the old creosoted deal blocks, which, under the wear and tear of skidded omnibus wheels, cannot last more than a couple of years, when all the present discomfort will have to be repeated? There is no excuse for this reactionary measure, for there are now three or four large companies in London engaged in the supply of the durable Australian woods, and able to furnish any quantity of the necessary blocks. One feels almost inclined to echo the witticism of Sydney Smith, and say if only the vestrymen would lay their heads together the thing would be done. Meanwhile, we sincerely commend the action of the Strand to other paving authorities as an example of how not to do it.

THE recent great fire in London, which laid so many houses low, has done good service in calling attention to the utterly false security promised by so-called "fireproof" buildings. The buildings are so far fireproof that the materials used in their construction—iron and concrete—will not take fire. But what happens when such a structure is stored with highly-inflammable goods, should such goods become ignited? The building acts like a fireplace, its numerous staircases, lift-shafts, and windows acting as flues, until its interior is one mass of glowing heat. Then the heat acts upon the iron girders, causing them to lengthen, by several inches, and to exert an outward thrust upon the walls, which speedily brings them down. Good strong, old-fashioned oaken beams are far safer, for they take a long time to burn through, and they do not elongate by the action of heat. It is obvious that there is room for great improvement in our methods of building construction in view of risk from fire.

CRANFORD HOUSE, an ancient house on the Bath Road, a mile or two from Hounslow,

which has been in the possession of the Berkeley family for nearly three centuries, is about to be tenanted by Lord Fitz-Hardinge, after having remained unoccupied for many years. The residence is the manor house of the village of Cranford, and has long enjoyed the reputation of being haunted, many stories being current of the appearance of ghosts of long-departed members of the Berkeley family. The building was commenced by James, Earl of Berkeley, in the seventeenth century, and it has been added to by many of his successors, so that the existing structure is a curious mixture of architectural styles. The adjoining parish church is said to be the smallest in the county of Middlesex.

EARL PERCY has laid a memorial stone of the Church Schools, to be known as "The Medd Memorial Schools," now in course of erection at Amble, in the presence of a very large gathering of people. The schools are to be erected to perpetuate the work of the Rev. A. O. Medd, in the parishes of Amble, Bamburgh, and Rothbury. They are to cost £2800 (including site), and, of this amount, subscriptions and promises have been made amounting to £1400. The plan of the new building will be on the class-room system, with centre corridor, this being considered the most desirable system for teaching purposes. Mr. J. W. Douglas, Alnwick, is the architect; and Messrs. R. Carse and Son, builders, Amble, are the contractors.

THE Globe is asking for a wheel-less Eden, to take the form of a short street—only one short street—which shall be sacred to foot passengers, and in which vehicular traffic should be absolutely prohibited. It points out that abroad the idea is by no means new. Paris has its Palais Royal, Milan its Galleria Vittorio Emanuele, and, to go further afield, Rio de Janeiro its Rua do Ouvidor. There is much to be said for the idea, but it is doubtful if the powers that be could fix upon the street. The reason for this enquiry upon the part of the Globe is the resumption of traffic in the Strand, with its accompanying whirl of noise and danger. We have long had an idea that if a man opened a building in which his harrassed brethren might find a comfortable chair and an hour's peace and quietness, the proprietor would make a good thing of it. From the whirl and bustle there is no escape for the visitor or suburban resident, and of quiet places with a plentitude of seats London is absolutely destitute.

SERIOUS news comes from Ely, where portions of the cathedral fabric show signs of decadence. Apparently some of the additions to the cathedral during the past generation are scarcely worthy the older work, and will not stand the test of time. In the case of the Peacock memorial, which reveals signs of decay, extensive repairs are necessary, and the causes which affect the structure are exciting interest among builders and scientific men. It seems that the lantern is built of oak, rich in tannic acid, with probably a trace of mellic acid. Over the oak work a thin sheeting of lead was battened, and the acids from the wood have attacked the lead, reducing its substance. Sun heat has drawn and cracked it, thus admitting the carbonic acid of the atmosphere. As a result remarkable reductions have taken place, and carbonate of lead seems to have been produced in considerable masses. All this has inspired the fear that the lantern might soon become denuded of its lead. Another modern work that is within measurable distance of obliteration is the painted ceiling of the nave, which is rapidly fading, whilst the pigments are becoming powdery, and falling imperceptibly away. The maintenance of our cathedrals, so zealously and reverently undertaken in the case of Norwich, is a heavy responsibility in these latter days; and Ely will speedily offer plenty of scope for the work of restoration.

UPWARDS of 200 men are already employed by Messrs. Walter Scott and Co., Newcastle,

on the extensive gas works being erected at the high side of Walker Estate, near the old toll house on the south-western boundary of the township. The works, which, when completed, will be among the most extensive of their class in this country, will cover an area of 81 acres of land, mostly on Lord Northbourne's estate, and partly on the Walker Estate. The new erections will consist of five sections, each complete in itself, with a gasometer capable of containing five million cubic feet of gas. It is understood that Messrs. Middlemiss Bros. will manufacture the bricks required from the clay taken from the excavations necessary to make way for the huge gasometers, which will be lowered to a depth of some 60ft. It is proposed to build three streets at a later date in the neighbourhood of the new works, of a class of dwellings suitable for the requirements of working men.

ALTHOUGH the serious question of cost has given pause to the movement for completing the restoration of Selby Abbey "the most perfectly preserved specimen of a monastic church in Yorkshire," a good deal of interest continues to be taken in the famous edifice by the general public. The fine Norman nave of Selby Abbey was restored in 1871, under the direction of Sir Gilbert Scott, and Mr. Oldrid Scott superintended the restoration of the choir about eight years ago. The nave was declared by the President of the Royal Academy to be the most exquisite specimen of Norman Architecture that he knew; and Sir Gilbert Scott wrote of the choir that it would be difficult to find an example of the Decorated style—except in some of our finest cathedrals—more perfect than at Selby. The cost of the further work is estimated at £10,000.

THE official report as to the explosion at Earl's Court Exhibition recently, by which one man was killed and two injured, exonerates the Exhibition authorities from all blame. The theory that the accident was due to a lighted match thrown down near the door of the magazine is rejected by Her Majesty's inspector, who is of opinion that the ignition was spontaneous, and occurred inside the building.

COLSTON HALL, Bristol, one of the most famous halls in the West of England, was destroyed by fire on Thursday. The conflagration began in a clothier's shop adjoining, and, in spite of all efforts, spread to the hall, of which nothing remains but the bare walls. The Trade Union Congress, who were holding their sittings there, have been unhoused, and the arrangements for next week's meeting of the British Association have been upset.

THE introduction of electricity as an illuminant in St. John's Market, Liverpool, has proved an unqualified success, and therefore it might be suggested that other Corporation markets should be similarly dealt with. Scarcely any shops or stalls have been vacant since the completion of the new lighting system, and the market has proved more attractive to buyers, judging from the larger number of people who now transact business there. Another important fact is that the electric light has not that detrimental effect on fruit and poultry which the heat of gas is apt to occasion, especially in the hot season, and although electric lighting is found to be a little more costly than the old system, it would be a great improvement were it extended in the way indicated.

A GREAT amount of interest has been excited in archaeological and scientific circles, both in England and in Scotland, by the discovery, already referred to in these columns, of a crannog or lake-dwelling on the banks of the Clyde, a little to the east of Dumbarton Castle. The find is declared to be one of the first importance. Its associations and structure are unique, and the immediate excavation and investigation of the place is advised. Already a further discovery of an interesting character has been made, a "grand" type of canoe, 37ft. long by 48in. beam, having been found. The canoe is dug out of a tree.

THE FEUDAL PRINCIPLES OF REAL PROPERTY LAW.

BY WILLIAM H. STACPOOLE, LL.D.,
Barrister-at-Law.

I.

TO the ordinary lay intelligence the most difficult and, in many respects, unintelligible branch of our laws is that which relates to what is called real, as distinct from personal, property.

Common sense by itself will tell us much about the legal rules and principles that regulate contracts and conveyances of everything but land, when land is dealt with as realty; but about the law of real property in land, mere unassisted common sense can give no information whatever, though it may very well appreciate the effect of certain statutes by which the rules of this law have been, to some extent, ameliorated and brought into harmony with the spirit and requirements of modern times.

The reason of this is that the old law of real property which, be it remembered, to a large extent still exists, and whose fundamental principles still live in our jurisprudence, was the outgrowth of a social state which people of the present day can only very dimly realize, if, indeed, by a strong effort of the imagination they can do so at all. This old law had at one time a practical utility. The conditions of life which gave it practical utility have long since disappeared, and its principles and rules are at once unintelligible and inexplicable without them. Nevertheless, the old law, as I have said, still exists. Its vital principles flourish to-day as they did five centuries ago, and its rules are still operative, except where one or other of them has been expressly annulled by the isolated operation of certain Acts of Parliament, whose purpose and effect it requires some knowledge of the old law itself to appreciate.

In the following articles I propose to give, in language as familiar and untechnical as possible, a brief sketch of the origin and growth of the principal tenures of real property in England. I do not at all promise the reader that he can be "his own lawyer" when he has perused the articles; on the contrary, I expressly warn him that he will act very foolishly if he attempts to be anything of the kind. All I can promise him is an intelligent knowledge of the different kinds of estate in land which are included under the term freehold, and of some of the general principles and rules of law that apply to these estates. With a knowledge of this kind he will not necessarily be an expert, but he will be the better able to gauge the advice of experts, and, where he has to seek their assistance, discuss his business with them on a more equal footing, and without requiring constant, and, perhaps, imperfectly understood, information on elementary points. Besides which, some general knowledge of a subject in which one is constantly dealing seems necessary for general guidance. At every step in this inquiry we shall see how closely interwoven are the theory and history of the law.

Thus, at the very outset, the terms real and freehold are often, though not quite correctly, used as synonyms when applied to property in land. All freehold estate is real estate, though, as we shall see, some real estate is not freehold. How did property in land come to be called real, and how did it come to be called freehold? As regards the term "real," the answer is this: Land is different from all other things in this respect—that it cannot be carried away or destroyed. If a man wrongfully possesses himself of your money, your jewellery, your cattle, or your clothes, he may destroy or make away with them, so that it would be impossible to recover from him the identical things that he has taken from you. You could then have

only an action *ad personam*, as it was called in old times, or an action against his person to recover monetary damages for such loss. On the other hand, he could not make away with an acre of land, and if you were wrongfully deprived of land, you could have an action *ad rem*, as it was called; in other words, an action for the recovery of the real thing that was taken from you. Actions for the recovery of land, then, were called actions *ad rem*; actions for the recovery of other things, actions *ad personam*. Presently the former were spoken of as real actions, and the latter as personal actions, and then the terms "real" and "personal" were applied to the things that formed the subject-matter of the actions. The reader will probably ask here why, according to this explanation, a leaseholder has not real property in the land he leases, since, if wrongfully ejected, he can have an action for the recovery of it. The answer is, that in old times he could not have had any such action. In early times the leaseholder was not regarded as having any ownership in the land, but merely as a bailiff, or caretaker, in the service of the freeholder, to whom he had to account for the profits at a certain fixed sum, called rent. If deprived of the possession of the land, he could only have had an action against the person of the owner to recover damages for breach of contract. The term "freehold" meant such an estate in land as it was worthy of a free man to accept, which, in ancient times, was an estate for his own life at least, though subsequently an estate for the life of another person (called an estate *pur autre vie*) was regarded as freehold.

What we call the law of real property is (excepting, of course, the provisions of certain modern statutes) the development in England of the feudal system. The feudal system was the polity of the northern nations when they overran Europe during the early centuries of the Christian era. Feudal means of the nature of fees, or payments for services rendered and to be rendered. The feudal system was the system of portioning out a conquered territory amongst the soldiers of a conquering army, and giving to each soldier so much land, not to be his absolute property which he could do as he liked with, but to hold from the general during such time, and only during such time, as he performed certain military duties which were necessary for the defence of the territory. These allotments were called feuds, fiefs, or fees. They were, in fact, of the nature of a salary which is paid partly for services already rendered, and partly for services to be rendered, only that the payment was in land, and not, as now, in money. And so, on the death of the military tenant, or *holder*, the land reverted to the general of whom he held, and who would then give it to someone else to hold so long as he performed the same services.

This is the original and fundamental idea of feudalism, and it ought to be noted here that to feudalism in this, its pure state, primogeniture, or any other form of inheritance, was unknown.* Having been educated by his father, the eldest son would seem to be a likely person to discharge the duties of his father properly, and, accordingly, a custom arose of appointing the eldest son to succeed his father, from which custom he gradually acquired a prescriptive right to the appointment. But it should be remembered that inheritance of any kind is not contained in the original conception of feudal or stipendiary holding of land from a chief, which is the essential idea of the whole system.

Another quality of these early feuds was that since they were given to the tenant as recompense for his own personal services, they could not be sold, exchanged, mortgaged, or in any way alienated. "For," says Blackstone, "the reason of conferring being the personal abilities of the feudatory to serve in war, it was not fit he should be at liberty to transfer this gift either from himself, or from his posterity, who were presumed to inherit his valour, to others who might prove less able; and as the feudal obligation was looked upon as reciprocal the lord could no more transfer

his seignory or protection without consent of his vassal than the vassal could his feud without consent of his lord. . . . These were the principal, and very simple, qualities of the genuine or original feuds, which were all of a military nature, and in the hands of military persons."[†]

The above are the principles of the feudal system in its pure and military state, from which in different countries various systems of laws were deduced as corollaries by lawyers who were highly trained in what is known as the scholastic philosophy, which was concerned much more in considering the logical accuracy with which conclusions were deduced from their premises than in any attempt to estimate the truth or utility of the propositions employed.

"As soon," says Blackstone,[‡] "as the feudal system came to be considered in the light of a civil establishment, rather than as a military plan, the ingenuity of the same ages which perplexed all theology with the subtlety of scholastic disquisitions, and bewildered philosophy in the mazes of metaphysical jargon, began also to exert its influence on this copious and fruitful subject: in pursuance of which the most refined and oppressive consequences were drawn from what originally was a plan of simplicity and liberty, equally beneficial to both lord and tenant, and prudently calculated for their mutual protection and defence. From this foundation, in different countries of Europe, very different superstructures have been raised."

I am going to sketch the superstructure that was raised in England, a very considerable portion of which remains to the present day. In doing so I shall avoid as much as possible all matters of a purely archaeological or historical importance, and such as are only likely to be of interest to lawyers as such. My purpose is to exhibit the broad features of freehold tenure in so far as they are developments of, or explicable by, feudal principles.

An English subject may have the absolute ownership of goods, he cannot have the absolute ownership of land. The fundamental maxim of our law of tenures (though practically it may now be regarded as a fiction) is that "the king is the universal lord and original proprietor of all the lands in his kingdom, and that no man doth or can possess any part of it, but what has mediately or immediately been derived as a gift from him, to be held upon feudal[§] services."^{**}

In the first year of the actual, and the twelfth of the nominal reign (on the principle that the king never dies) of Charles II. a very important Act of Parliament was passed (12 Car. II., c. 24). The epoch which preceded, and that which followed the passing of this statute, may be considered as two grand epochs in the history of real property law in England, though the statute itself left untouched the spirit of the feudal system, and only altered the nature of certain of its consequences.

In the next article I propose to consider the peculiar incidents of tenure which were destroyed by this statute, and then, in subsequent articles, the nature and methods of inheritance of the tenures by which lands are now holden. The result will, I think, be to show how curiously a complicated mass of laws are unified by a few simple principles (however antiquated they may be) such as are enunciated above. It will also show how necessary a knowledge of the history and assumed axioms of real property law are to its comprehension as an intelligible system, however remote from the practical exigencies of modern life. On the ground of practical present-day utility the law of real property cannot be defended, though the defence, or, at least, explanation, is possible if we regard it as part of an ingenious system of deductions from fixed, though possibly to us of the present time fanciful, propositions.

(To be continued.)

* The statute 12 Car. II., c. 24, only abolished the military tenures. Socage, into which they were converted, is "of the feudal nature."—2 Bl. Com. Ch. 6. Of this we shall see more presently.

* Blackstone's Commentaries, Book 2, Ch. iv. This volume will be referred to hereafter as 2 Bl. Com.

CHURCH DECORATION AT SUDBURY.

THE services of Mr. G. F. Bodley, A.R.A., were secured for the renovation of St. Peter's Church, Sudbury, and the erection of a new reredos therein. The torn and soiled papering has been removed from the western side of the chancel arch, and the wall repaired and richly decorated. On either side of the arch, on green diaper work, are very large figures of angels, in flowing draperies, swinging censers; while over the centre of the arch two angels, in smaller design, are holding a blue shield, bearing the sacred monogram. The ledge above, which formed the canopy of the original rood, has been painted blue, with gold decoration; and along the entire length runs a vellum scroll. Above the ledge has been placed a gilded cresting of beautiful fifteenth century work, broken with three shields, the three crowns of the Diocese of Ely in the centre, and on either side the arms of the Provinces of Canterbury and York. The decoration of the easternmost bay of the nave roof is very effective; but perhaps one of the most interesting features of the work is the painting of the chancel roof. The ground work of the first bay is a superb red, each panel containing a handsome wreath of black-and-white twist, in the centre of which is the sacred monogram in gold. Across the corner of each panel are vellum scrolls, bearing the words, "Laus, Honor, Gloria, Amor," and between the scrolls are raised stars. In the rest of the roof the ground work of the panels is green, with blue turn-overs, surrounds the letter "P" in gold. The beams are of deep red, relieved with black-and-white chevron, and the spandrels are heavily gilded; while the angels which form the corbels are in blue-and-white copes, with gold wings, and each holds a scroll, bearing a short Latin text. An inscription runs round the chancel walls, immediately beneath the roof, taken from the Communion Service. The side walls of the choir and sanctuary are a deep Venetian red, with pine diaper in a darker shade of red. Between the springs of the arches are eight shields, surmounted with large gold crowns; the shields are grey blue, the four in the choir having the crossed keys of St. Peter, those in the sanctuary the emblems of Evangelists. A good deal of other artistic work has been carved in this part of the sacred edifice. On the south wall, behind the sedilia, is a rich curtain of tapestry in red, black, and gold. The splay of the east window has been coloured, and is decorated with shields bearing the sacred monogram, while between the shields is a small vellum scroll with "Alleluia" in black letters. The monotony of the red walls is also broken by the five painted windows Mr. Bodley has placed in the clerestory of the chancel. The four windows in the choir are two-light windows, and each light contains the figure of an angel vested in a rich cope of soft blue green or crimson, and a member of the Celestial choir is holding one of the musical instruments mentioned in Holy Scripture. In the upper tracery of the windows are handsome shields, bearing respectively the arms of Ely, Canterbury, Bury St. Edmund's, and the emblem of St. Peter. In the three-light window re-opened on the south side of the sanctuary are figures of the three Archangels, St. Michael in the centre, St. Gabriel next the altar, and St. Raphael. St. Peter's is a fifteenth-century church, and the reredos has been carried out in the true character of that period. It is 20ft. high, and 7½ft. wide. The main groundwork is red, but the canopy work and decoration in gold and colour is so rich that very little of the red is seen. On either side, and round the top, runs a carved banding of vine leaves and grapes, gilded, but glazed down to colour. The figures are raised, and stand out well. The three central ones are beneath rich gold canopies. The centre is that of the Saviour, on the north side is a representation of the Blessed Virgin, the outer robe being of soft blue, the under robe of gold being glazed down to deep red. On the south side is the figure of St. John, the

outer robe being of green, lined with a lighter shade of the same colour, the under garment of gold also glazed down to a deep red. In choice canopy work beneath the Cross is a panel illustrating the Annunciation. The Blessed Virgin is kneeling at the "prie-dieu," on which is carved the conventional lily. Her outer garment is of blue, the inner being glazed to soft red. Before her stands the Archangel, clad in a garment of white and gold, with a cope of soft green turned over with light blue. Above her hovers the dove. In the panels, on either side of this, are groups of angels, finely carved, decorated in white and gold, and holding in their hands scrolls, which bear the words, "Gloria in Excelsis," and "In Terra Pax." The lower part of the reredos takes the form of a lofty re-table, with a bold projection, adorned with bosses of gold and small paterae and dark green carnations. On this are five panels of carved tracery work, surrounding emblems of the Passion; while on the face of the lower re-table are the words in high gold relief, "Ecce Agnus Dei Qui Tollit Peccata Mundi." The reredos is set off with wings of tapestry in two shades of green, ornamented with gold pines; while before the reredos stands the new altar, of best English oak. A great improvement has been made to the sanctuary by the removal of the gas standards, and the substitution of brass wall candelabra of seven lights with sconces.

KEYSTONES.

THE Lichfield Guardians are now considering plans by Mr W. H. Woodroffe for an extension of the workhouse buildings.

THE Earl's Court Exhibition next year will take the form of a Colonial Exhibition, and large application for floor space has been received. The spectacular feature in the Empress Theatre will illustrate scenes from colonial life.

THE Gloucester School Board lately invited local architects to compete for a new school. Mr. Martin, of Birmingham, was appointed referee, and by his award the first prize was awarded to Mr. A. J. Dunn. By a majority of one it was, however, decided to appoint Mr. Medland to carry out the work.

THE memorial stones of the New Bethany English Congregational chapel at Aberaman have been laid. The new building is a very neat structure, capable of seating 450 to 500. It has been built by Mr. J. Jones, Gwawr Cottage, from plans prepared by Mr. T. Roderick, architect, Aberdare, and is situated on a site on the new main road from Aberdare and Aberaman to Cwmaman.

THE foundation stone has been laid of the proposed Church Hall at Springfield, Essex. The hall, which will cost, with the furnishing and the purchase of the site, about £1000, is being built by Mr. Frank Johnson to plans executed by Mr. George E. Clare, architect. The building will be of red brick with stone dressings, will seat 364 persons, and will have a vestry attached to it.

THE Public Health committees of the local authorities of the burgh of Arbroath and the Arbroath district of Forfarshire, to whom the matter was remitted, have approved of erecting a joint epidemic hospital to supersede the present hospital belonging to the burgh, which is closely environed with dwelling houses and by the infirmary. A sub-committee has been appointed to look out for a suitable site.

A BUILDING ORDINANCE was recently passed by the City Council of Chicago compelling the use of swivel windows above the second story of all new buildings. The purpose of the law is declared to be the prevention of the numerous accidents attending the cleaning of stationary windows. The new law provides that upper story windows must swing on horizontal or vertical pivots, otherwise a balcony must be built in front of every window. Opposition has arisen to the law on the ground that it was designed to benefit the owners of patents on swivel windows, and also that the size of windows will have to be reduced owing to wind pressure, and accidents will result from falling window-sashes.

THE NEW STATION AT NOTTINGHAM.

THE work on the site of the new Central Station in Nottingham has not yet assumed a very imposing appearance, but short of an inspection at close quarters, it is impossible to obtain any idea of the immense amount of labour which has already been accomplished. As has already been announced, there are to be two island platforms at each end, and their length on the main line is to be upwards of 1100ft. The contractors have yet to erect the huge retaining walls, both on the Mansfield Road and on the Windsor Street sides, and for a considerable distance these will also serve as supports to the station roof, a massive structure of steel and glass. The steel columns, 42ft. 6in. high, and 15ft. apart, which are already fixed on the main platforms, are intended to carry the roof, and an archway between the columns exactly facing Shakespeare Street denotes the location of the new public footbridge which the Company are erecting across their station. At the present moment the work of pressing importance is the completion of the fine bridge from Bywell Street to Glasshouse Street for public use, so that the temporary bridge lower down may be demolished. Several girders remain to be fixed on the York Street side of the permanent bridge, but meanwhile the roadway for the greater part of the distance across is being made ready for handing over to the Corporation for metalling. Under the main platforms run a perfect network of admirably-built subways for passengers' luggage, access to the cellars, and for the protection of the gas, water, and drainage pipes. The subway for luggage will be connected by two lifts with the booking hall on Mansfield Road, and has communication also with lifts with both the down and up platforms. It is faced with glazed bricks, and measures 14ft. wide by 11ft. 2in. high. A smaller tunnel, 8ft. wide, communicates with the cellars, which are situated immediately under the refreshment rooms. The storage is of the most complete character, and all the cellars have blue brick roofs, with steel joists. The buildings on the platforms are all to be constructed of specially prepared terra-cotta blocks and glazed bricks, and when completed they will have an exceedingly imposing appearance. In addition to the signal cabin at the Woodborough Road end, there are to be boxes on the down and up principal platforms, and a fourth close to Parliament Street bridge. The roof of the station itself will be about 420ft. long, and it will have five spans, but there will be what is known as an awning roof, 220ft. long, connected with it at either end. The station is to be lighted by electricity and gas, and the plant for the former is being provided in the goods yard. It remains only to be added that the contractors are proposing to face the Parliament Street bridge with brick and stone, and to erect an elaborate parapet. Much important work is still going on in the goods yard, but it is impossible to convey any idea of the immense change which has been wrought in the neighbourhood as the direct result of the construction of the new line.

THE great tower by the entrance of Haddon Hall is in danger. The large, overhanging turret has caused the wall to lean forward, and unless something is done to stop the movement a disaster may occur. A slight settlement of the great curtain wall to the south of the tower, which had occasioned that wall also to lean westwards, has accelerated this movement in the tower. It is recommended that to arrest the movement in walls some 25ft. high, a new 3ft. thick wall, well bonded to the old walls, should be built back to the fifteenth century curtain wall, which runs longitudinally between them in the aviary below the Earl's rooms. Another proposition is that the lead roofing and gutters, which were found past repair, should be taken up and recast on the site, and then relaid as before, any repairs needed to the roof timbers being undertaken at the same time.

WALL PAPER.

THE PROCESS OF MANUFACTURE.

THE employment of paper as a covering for walls originated, as many of our arts and manufactures did, with that Eastern race which are now occupying so much the attention of the Western Powers—the Chinese. It was introduced into Europe as a substitute for tapestry hangings by the French, and at the present time it offers probably the cheapest and most ornate means of mural decoration. The blank paper, usually weighing from 85lb. to 90lb. to the roll, is received by the manufacturer in long rolls. It varies in quality according to the printing and finishing it is going to receive, weighing 9, 10, 12, 14, and 16 ounces to the length of 12yds., which constitutes the usual length of the roll in England as sold retail. French papers are about 9yds. in length. The first process undergone is termed "grounding," and the object is to give the paper the requisite body to enable it to receive the coloured pattern, for which purpose it is passed through a pounding machine. While passing over a roller the paper is covered with a mixture of so-called Jersey clay, which contains some eighteen per cent. of alumina, glue, and water, and if the surface is to be finally polished, or satin finished, a percentage of lard oil is added. After the mixture is applied, it is evenly distributed over the paper, first by two reciprocating brushes, then by a rotating brush, and, lastly, by two reciprocating brushes again. It is then conducted between endless belts, across which sticks are laid, and over which sticks the paper is suspended in festoons. The sticks are so placed that

A LENGTH OF PAPER

measuring just 12ft. hangs between any two. The belts are kept in constant motion, and the paper is thus conducted along the shed, which is generally some 160ft. long. Steam coils are placed beneath the belts, and a temperature of 120deg. maintained. About nine minutes are occupied by any one festoon of paper in making the journey from the grounding machine to the point where it is again made into a roll, and during this period it becomes thoroughly dried. Frequently colouring matter is mixed with the ground paint, and the paper is thus given a flat tint, which forms a background for the pattern, or which is left unaltered when the paper is meant to be perfectly plain. Imprinting the pattern by blocks is done in two ways, either by the block or by the roller. In either case, each colour entering into the design must be printed separately, so that there must of necessity be as many blocks or rollers prepared as there are tints in the pattern. The blocks are constructed of two layers of wood, a thin piece of maple fastened to a thicker backing of pine board. Each block is about 26in. wide, 2ft. long, and 1½in. to 2in. thick. On the maple all the design to be printed in a single colour is drawn and afterwards cut out by engravers, so that the lines are in high relief. The more delicate figuring is not made in the wood, but is supplied by the insertion of bent pieces of brass, as explained presently. When the wood carving is completed, the work is brushed over with boiled oil, and when dry are sent for use. Hanging above the table at which the workman stands, supported by an indiarubber cord, is the block. The upper end of the cord is attached to a small wheel

TRAVELLING ON AN IRON GUIDE,

so that the block may be swung from the table over to the place where it receives its covering of colour. This last is obtained from what is termed the "slush-box," which consists of a shallow vessel, the bottom of which is covered with painted ticking. This box floats on a mixture of water and paper pulp contained in a larger box, so that its bottom is always perfectly level. The workman first places the paper across his table, then swings the block over to the slush-box and brings its carved side down on the paint. Next, he carries the block back again and places it on the paper, using great care in the registering, so that the impression may fall exactly

on the right place. A vertical movable arm attached to a frame above is then rested upon the back of the block, and forced down by a lever worked by the workman's foot. This process is repeated until the whole piece is covered with the pattern, which is hung up until perfectly dry. Hand-printing is now employed on borders which contain many colours, and in the finer qualities of decorated paper, where the care necessary for printing the numerous tints can scarcely be exercised during the motion of the rapidly-working cylinder machines. In roller-printing, the impression is obtained from a series of rollers, on the surface of which the design is raised. This process is employed for all the cheaper kinds, and hence for the greater proportion of all wall papers manufactured. The rollers are of maple, lined in the interior with brass. Four different sizes are used, and their width is always 18½in.

THE PATTERN OF THE DESIGN

is first drawn on paper and coloured, and then the outlines of the various parts are transferred upon the rollers, each roller printing only such portions as are of one particular hue. Unlike that of the blocks, the surface of the roller is not cut away, but the pattern is made by driving in pieces of thin brass, which the workman bends in a vice so as to correspond with the lines of the pattern. Where there is a considerable area to be printed "solid," its outlines are raised in brass, and glued felt is packed inside the metal boundaries thus made. In some cases, where the paper is not grounded, rollers are covered entirely with felt, with the exception of such portions representing the pattern as are intended to be left white. After the design is thus produced, the roller is placed in a lathe, in the side rest of which is fixed a vertical file, smoothing the surface; or if the roller be entirely felted, it is submitted, when the glue in the felt is dry, to the action of an emery wheel. The printing machine consists of a large cylinder or drum, around which the paper passes, and while thus carried the paper receives an impression from each roller in turn, the rollers being disposed around the periphery of the cylinder. Each roller is supplied with colour by an endless belt of felt, which passes down into a receptacle filled with the paint. If the paper is striped, the colours are blended by dry paint brushes held in contact with the surface as the cylinder rotates. If, however, the paper is to be satin finished, before the above operation takes place it is put

THROUGH A POLISHING MACHINE.

This consists of a central rotating brush against which the paper is carried by several metal cylinders. The alumina and oil in the ground-work admit of its being finely polished. The printed pattern is, however, in dead colour, so that when the paper is finished some portions have a lustre while others have not. As the printed sheet emerges from the machine, it is let over sticks on endless belts. The following ingenious device is employed for placing the sticks under the paper: At the ends of a roller, over which an endless belt passes, are two canes; above these and resting on their periphery is a pile of sticks. The cane shoulder equals in height the thickness of one stick. Hence at each revolution of the cane, a stick is moved from the bottom of the pile and carried down on and across the belts. Between the latter comes the paper which thus falls in folds over the sticks as they are laid in place. After the paper, becoming dry meanwhile, has been carried on the belts to the end of the shed, one end is connected to a swiftly rotating horizontal spindle, which winds it into tight rolls. These measure 12yds. in length, the sheet being cut as soon as a mark placed by the printing machine comes to the spindle. If the paper is to be embossed, this is now done by passing it through engraved metal rollers. Nothing further then remains to be done but to send it out for sale.

W. N. B.

WORKMEN'S dwellings are to be erected in Southampton, according to plans to be prepared by Mr. Hair.

Professional Items.

ABERDEEN.—The St. Fergus Parish Church has just been reopened after extensive alterations and decoration. The improvements included the introduction of new heating apparatus and a new organ, and the addition of two stained-glass windows. The church has also been very beautifully decorated. Mr. A. M. Mackenzie, A.R.S.A., Aberdeen, was the architect, and the contractors were—Woodwork, Mr. William Auld, Ellon; painting and decorating, Mr. John Whyte, Aberdeen.

BIRKDALE.—The Urban Council are about to erect a caretaker's lodge at the Victoria Park, at a cost of £575, and also a fire brigade station at a cost of £500. The designs have been prepared by Mr. F. C. Hodgkinson, the surveyor to the authority.

BRANDON.—The Cabot Memorial Tower, Brandon Hill, Bristol, has just been opened. Mr. W. V. Gough was the architect.

BLYTH.—A new theatre is to be erected here for the Blyth Theatre Co. Ltd. Plans have been prepared by Mr. Hope, of Newcastle, for an auditorium to seat 2500 persons.

CROMER.—A new hotel is proposed to be erected at Overstrand, Cromer, on the road between Overstrand and Sidestrand. Mr. Boardman, of Norwich, is the architect.

HECKMONDWIKE.—A new school has been erected in High Street, Heckmondwike. It is a handsome building, inside and out, and the accommodation afforded is all that can be desired. Throughout, the class rooms and corridors are excellently lighted and ventilated, and the conditions generally under which the scholars will work are as healthy and agreeable as it is possible to make them. The architect is Mr. A. A. Stott, of Heckmondwike, and the accommodation comprises places for 1090 scholars. The school has been erected at an inclusive cost of something like £18,000. There are chemical laboratories provided, Science and Art class rooms, lecture rooms, and eleven class rooms for elementary instruction.

INVERNESS.—The first scheme of additions to the asylum at Inverness is now completed at a cost of over £12,000. Messrs. Ross and MacBeth are the architects. Various improvements are to be carried out at an estimated cost of £18,000.

LIVERPOOL.—The new open-air swimming bath and gymnasium built in Gore Street for the free use of boys at the south end of Liverpool have been formally opened. The establishment is situate at the junction of Gore Street and Brassy Street, off Stanhope Street, and is immediately behind and abuts on St. Matthew's Church, Hill Street. It occupies the site of the Maiden's Bower, which consisted of about fifty dwelling-houses, these houses having been condemned as insanitary and pulled down many years ago. The bath and gymnasium cover an area of about 1100 square yards. The main entrance is at the junction of Gore and Brassy Streets. After passing the turnstiles you enter the gymnasium, a building 44ft. long, with an average width of 40ft. The gymnasium is to be provided with the usual "youth's" gymnastic apparatus, such as ladders, climbing ropes and poles, parallel bars, rings, &c. One end of the gymnasium opens on to the swimming bath, which is 75ft. long, 60ft. wide, and contains 70,333 gallons of water, having a water-depth of 2ft. 6in. at the shallow end, and 3ft. 6in. at the deep end. Covered dressing sheds are provided on both sides and ends of the bath, the side-walks averaging over 10ft. wide. The buildings, which are of the most substantial

and complete of their kind, are built with ordinary red bricks, having terra-cotta dressings, the gymnasium and offices being covered with a boarded and slated roof carried on iron principals. The gymnasium has a wood pavement floor, and is lighted from the roof and one end. The establishment was designed by and the work carried out under the supervision of the baths and washhouses engineer and chief superintendent (Mr. W. R. Court). The contractors for the work were Messrs. L. Marr and Son, Liverpool.

LONDON, W.C.—The new and spacious building which is in course of erection for Messrs. A. W. Gamage will be a conspicuous object in Holborn. The new building, which will be entirely faced with Portland stone, will rise to a height of 80ft. above the pavement, and will present a very handsome and imposing appearance, and will be one of the tallest buildings in London for business premises. The frontage towards Holborn is 66ft. in length, and towards Leather Lane 141ft., giving a total length of shop windows of over 200ft. The building is being erected in two sections—front and rear. The whole of the ground floor will be used as shop and sale rooms, whilst the basement will be utilised for warehousing. On the upper floors the front portion will be devoted to showrooms and order departments, the rear portion being used as showrooms, counting-house, and private offices, with dining-rooms for the accommodation of the large staff. It is intended to open a refreshment buffet, with private rooms for ladies. The buildings will have electric lighting throughout, with generating plant in the basement. There will be several passenger and luggage lifts. By an ingenious contrivance for putting in the substructure while supporting the floor of the shop in position, and afterwards building the superstructure over the shop, the whole of the work of rebuilding is being carried out without interrupting the ordinary course of business of the firm, or even depriving them of the use of shop window space for display of samples of their goods. The general contract is being carried out by Mr. J. Carmichael, and Messrs. Sage and Co. are entrusted with the fitting up of the shop front, Mr. Rendel, of Farringdon Road, fitting the inside fixtures. The works have been designed by and are being carried out under the supervision of Mr. J. Sawyer, F.R.I.B.A., of 63, Chancery Lane.

LOWESTOFT.—The new and handsome Board Schools, built to meet the requirements of the Education Department, and also the increasing requirements of the town of Lowestoft, erected in Lovewell Road, Kirkley, by Mr. Hawes, of Norwich, were opened last week. The new school was designed by Mr. W. Rushworth, of London and Croydon, and will accommodate 796 children—294 infants, 252 girls, and 250 boys. All the school rooms and class rooms are warmed by open fires, supplemented by hot water pipes and radiators, while the ventilation and light are admirable. The floors and staircases are constructed of fire-resisting materials, and the entrance doors swing outwards and inwards. The cost of the two blocks of buildings, with furniture, was £9636.

LONDONDERRY.—The new club-house for the Foyle Rowing Club is now in course of erection. The site of the building is on the Strand Road below the old tennis ground, with a frontage of 80ft. to the river. The club-house is to be fitted with all the most modern improvements, and will have a bath-room and gymnastic requisites. The upper portion of the building will consist of an entertainment room, which will be constructed to accommodate 200 persons. Mr. J. P. McGrath, C.E., Foley Street, is the architect, and Mr. Joseph Ballintine, of Derry, the contractor.

MANCHESTER.—The new Roman Catholic chapel at Victoria Park, Manchester, is near completion. The work is in the fourteenth century French style, and is carried out in red

brick with terra-cotta dressings. Mr. W. H. Rawle is architect, and Messrs. Wilson and Toft the contractors.

NEWCASTLE.—The Guildhall and Exchange is about to be re-opened after alterations and improvements. Various structural alterations have been effected, the principal being the substitution of steel girders and stanchions for the heavy stone piers which carried the north wall and the Guildhall floor, and the lowering of the Exchange floor. Messrs. Armstrong and Kurdoles were the architects, and Mr. W. R. Dodds, Jarrow, carried out the plaster work, the general contractor being Mr. Thomas Lumsden, of Jarrow.

NORWICH.—The Church of St. Peter Mancroft has been reopened after restoration. In January the following report on the chancel floor levels was made by Messrs. W. Bucknall and G. N. Cowper, architects, of 19, Old Queen Street, Westminster, who completed the restoration of the tower some few years ago:—"The levels of the chancel floor of St. Peter Mancroft, Norwich, as they are at present, are very evidently not the original levels. They are, moreover, very detrimental to the dignity of the church. The great height of the Presbytery floor, which remains very nearly at its original level, is very unusual in an English parish church. It is, of course, accounted for by the passage beneath this part of the church, which is now no longer used. Besides St. Peter Mancroft, two other notable examples of this feature in Norfolk churches may be mentioned, viz.: St. Gregory's in Norwich, and the parish church of Walpole St. Peter. In both these churches the Presbytery floor is even higher, and it is accounted for in the same way, viz.: by the existence of a passage underneath. But, unlike St. Peter Mancroft, the levels in these cases appear to remain very much as they originally were, and they are therefore valuable examples to be borne in mind in the present instance. The chief point of difference between the levels of these two chancels and the present levels of St. Peter Mancroft is that, in the former, the main flight of steps occurs eastwards of the choir stalls. Thus the higher level is confined to the Presbytery, and much greater dignity is given to the whole appearance of the church. A raised Presbytery was, as already implied, a thing avoided in English parish churches, while a raised choir would seem to have been unknown to them. But where the former exists it is a misfortune that the dignified effect of which it is capable should be spoilt by placing the choir stalls on the same level. It is, therefore, proposed to bring these down to what was, beyond all doubt, their original level of one or at the most two steps above the level of the nave, and at the same time to reclaim for their use the westernmost bay of the chancel, which, to the great destruction of the dignity of this very fine church, has been utilised for some of the nave seats. It is quite evident from the bases of the pillars that the original levels at St. Peter Mancroft were similar to those of the above-mentioned churches. There are also indications showing that the present floor of the Presbytery is at its highest part some 7in. lower than the original level. This can either be restored at the same time, or left as it is, as far westwards as the temporary wooden floor, which should in either case be removed. As regards the material of the floor and steps, we should recommend that the existing stones should be used as far as possible, and that the rest should be made up in plain stone to match. Of far more importance than any elaborate pavement is the restoration of the old levels, and the cost of a small portion of elaborate pavement would go far towards meeting the expense of this. Moreover, in the two above-mentioned churches the chancel floor is all of plain stone; and so it is in most churches of this date. And whether their original floors were or were not more elaborate, the plain stone is eminently satisfactory and at home in England. If, however, money for it is forthcoming, some bands of small glazed green and yellow tiles in elaborate patterns would be the most

desirable form of enrichment at present at disposal for the fabric of the floor. Marble and Italian mosaic should be rejected as unsuitable to England, and entirely out of keeping with this most typical English church. But we should recommend, as of the next importance to the restoration of the levels of the floor, a decoration which can be added to it in the form of some really fine and suitable ancient Oriental carpet, such as is to be seen in the northern pictures contemporary with the church. Such a carpet may occasionally still be met with, and would furnish the church better, and be finer in colour than any decorated pavement; and however elaborate the pavement may be, it does not dispense with the need of a carpet."—It was unanimously agreed by the vestry to authorise the vicar and the churchwardens to apply at the Consistory Court for a faculty for carrying out the work of the restoration of the chancel to the original levels on the lines of Messrs. Bucknall and Cowper's report, and also to form a side chapel on the north side of the church for daily service, and this has since been done, and the work completed, the chancel floor having been generally restored to what is believed to have been its original level, and the side chapel formed as desired. In the course of the operations an interesting discovery was made of a staircase leading from what is believed to have been the priests' chamber under the organ, and leading up to the altar. The remains of this staircase have been preserved, and an iron grating placed above them. Practically the whole of the work, which has been carried out in a very satisfactory manner, has been executed by Messrs. J. Downing and Son, and everyone appears to be agreed that a very great improvement has been effected.

PENSHURST.—The result of the competition instituted by the Sevenoaks District Council, for the best set of drawings for workmen's cottages, has been won by Messrs. Taylor and Sons, of Aylesbury. Mr. Edgar Wood, F.R.I.B.A., of Manchester, was the assessor, and had sixty sets of drawings to adjudicate.

STANLEY.—The ceremony of dedicating the newly-erected Episcopal Church at Stanley was performed recently. The work was entrusted to Messrs. Spiers & Co., Glasgow. The site is conveniently situated near the centre of Stanley on the main road to Perth. The church itself has a pleasing appearance. It is a composite structure in an English half-timber style of Architecture. The foundation is of brick, the lower outer walls being creosoted weather boarding, and the upper walls are finely lined and panelled. The entrance porch and vestry are in harmony with the main building.

The Clacton-on-Sea Urban Council has resolved that any householder requiring a supply of salt water for the purposes of baths, flushing, &c., shall be allowed to connect with the sea-water main, where convenient, free of charge.

A PROJECT is under consideration for securing the waters of the Upper Derwent for the supply of Mid-Derbyshire, the Corporation of Derby, Nottingham, Leicester, and Sheffield, at a cost of £23,000,000, to yield 14,000,000 per diem.

The Master Plumbers and Plumbers' Union of Ottawa have appointed a committee to interview the Council and learn why the plumbing by-law passed in 1893 has not been enforced. The by-law calls upon every master plumber to take out a license at 2 dollars per year, and to give a bond of 200 dollars as a guarantee of good work; the license fee for journeymen plumbers is 25 cents. It is claimed that the health of the citizens has suffered because of defective plumbing-work done by incompetent and irresponsible firms, and the Council will be urged to enforce the law for the future and to incorporate in it a provision that iron pipe in houses should be carried through the foundation and protected by a stone arch, so that when the foundation sets the drain still remains unimpaired.

CARBOLINEUM AVENARIUS

(REGISTERED),

PATENT WOOD PRESERVATIVE.

CARBOLINEUM AVENARIUS, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

CARBOLINEUM AVENARIUS entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

CARBOLINEUM AVENARIUS, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen St, Cheapside, London.

To All Owners and Users of Steam Boilers.

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen Street, London.

INDESTRUCTIBLE

COMBINATION WASHERS,

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure.

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplanned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

PETERS, BARTSCH & CO., DERBY.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AYLESBURY (Bucks).—For alterations and repairs to Walton Villas, Aylesbury, for Mr. T. Horwood. Mr. Ernest Hazell, architect, 23, Moorgate-street, E.C.:—
Seth Grist, Limited ... £1,078 | S. Mayne and Son ... £1,024
J. S. Holland ... 1,091 | Webster and Cannon* ... 984

BRENTWOOD.—For reflooring the boys' playroom at Hackney Schools, Brentwood, Essex, for the Guardians of the Hackney Union. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C.:—
Barrett & Power, Hackney* ... £179 | S. R. Lambel† ... £169
† Amended, £219.

BURNLEY.—For additions to the workhouse, for the Union Guardians. Mr. S. Kitchley, architect, Nicholas-street, Burnley. Quantities by the architect:—
Masonry and Bricklaying.—Smith Brothers, Burnley ... £9,940
Joinery.—Nuttall and Whittaker, Burnley ... 2,139
Slating.—William Staworth, Burnley ... 496
Concrete.—Phoenix Fireproof Company, Manchester ... 1,125
Plumbing.—George E. Whitehead, Burnley ... 1,434
Plastering.—J. Laycock, Colne ... 544
Painting.—Jas. Holt, Burnley ... 210

FERNDALE.—For the rebuilding of two shops and premises in High-street, for W. A. Davis, Esq. Messrs. Edgar Down, A.R.I.B.A., and A. J. Jones, joint architects, 1, City-chambers, Queen-street, Cardiff:—
Jenkins ... £1,355 | Morris* ... £1,020

HONITON.—For erecting a new bank for the Devon and Cornwall Banking Company, at Honiton, Devon. Messrs. Ralling and Tonar, architects, Bedford-circus, Exeter:—
Williams ... £3,400 | Nix ... £2,953
Brown ... 3,173 | Turner ... 2,907
Bird & Pippard ... 3,120 | J. W. & H. Childs, Yeovil* ... 2,879

HULL.—For the erection of stabling and workshops, for Mr. C. Roemer, Hull. Mr. E. Whitlock, architect, 26, Scale-lane, Hull. Quantities by the architect:—
Bricklaying.—J. Stephenson, 66, Durham-street ... £105 4 6
Joinery.—Jones & Sanderson, Craven-street ... 34 0 0
Slating.—Mark Woodcock, 25, Stanley-street ... 23 9 6
Plumbing.—H. Halmshaw, 82, Copan-street ... 11 4 0
Masonry.—Wrigglesworth, 161, Walton-street ... 9 10 6
Painting.—R. Monaghan, Barnston-street ... 8 15 0

KINGSTON-ON-THAMES.—For erecting new offices and disinfecting chambers, for the Guardians of the Kingston Union. Mr. Wm. H. Hope, architect, Portsmouth-road, Kingston-on-Thames:—

	Offices.	Disinfecting Chambers.
H. J. Shelley ...	£6,447	£381 12 6
J. H. Jarvis ...	6,335	—
J. W. Brooking ...	6,354	358 0 0
Dockerill and Sons ...	6,326	348 12 4
Speechey and Smith ...	6,289	354 0 0
General Builders, Limited ...	6,260	338 13 7
McCarthy E. Fitt ...	6,077	348 0 0
Wm. C. Cheshire ...	6,046	350 0 0
Merrifield and Wort ...	5,999	331 0 0

LANCASTER.—For alterations, &c., to Wilson's Endowed Schools, Over-Kellet. Mr. J. Parkinson, architect, 67, Church-street, Lancaster:—

Masonry.—R. T. Constable, Carnforth ...	£269 0 0
Joinery.—Wm. Brearey, Carnforth ...	142 11 6
Plumbing.—Billington and Son, Carnforth ...	26 0 0
Slating.—Hall and Son, Lancaster ...	68 0 0

LONDON.—For work at the "Nell Gwynne," Strand. Mr. Horace Wakeley, architect:—
Lane ... £197 0 0 | Leman ... £193 11 6
Learman ... 187 0 0 | A. Bush ... 180 0 0

LONDON.—For alterations to heating apparatus at Hackney Union Infirmary, Homerton, N.E., for the Guardians of the Hackney Union. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C.:—
W. J. Fraser and Co., Commercial-road ... £391
Nos. 50, West India Dock-road, and 2, Pennyfields, E., for Messrs. T. Westhorp and Co. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C.:—
W. Silk and Son ... £2,437 | Kilby and Gayford ... £1,992
Barrett and Power ... 2,117 | J. H. Johnson, Limehouse (accepted) ... 1,725
S. R. Lambel ... 2,061 | house (accepted) ... 1,725

LONDON.—Accepted for erecting ladies' cloak-room and lavatory on the recreation ground, Earlam Grove House, for Wood Green District Council. Mr. J. Gunyon, engineer:—
Jas. Pavey, Wood Green ... £220

LONDON.—For alterations at 11, Westbourne-grove, W., for Mr. Nathaniel Abrahams. Messrs. Clark and Hutchinson, architects, 28, John-street, Bedford-row, W.C.:—
A. P. Mitchell ... £553 | E. Sandon ... £485
Robert Smith (accepted) 487

LONDON.—Accepted for works at the "Blenheim," Cale-street, Chelsea, for the New Westminster Brewery Company. Mr. H. W. Budd, architect, 75, Vincent-square, S.W.:—
Fittings and Fixtures.—Drew and Cadman ... £382 0
Gasfittings.—Buckley and Beach ... 142 18
Peatery.—Buckley and Beach ... 134 18

LONDONDERRY.—Accepted for the erection of new club-house at Quay, for the Trustees of Foyle Rowing Club. Mr. J. P. McGrath, C.E., architect, Commercial-buildings, Foyle-street, Derry:—
Joseph Ballintine, Londonderry ... £500

NAZING.—For the erection of a villa residence at Old House Farm, Nazing, Essex, for Mr. John A. Rufus. Mr. J. Williams Dunford, architect, 100c, Queen Victoria-street, E.C.:—
Lawrence ... £1,258 | Fuller ... £965
Matthews ... 1,133 | Merridew and Wort ... 934
Burrage ... 1,036 | Winch* ... 830
Hampton ... 970 | * Accepted.

NEWPORT (Mon.).—For the rebuilding of Central Schools, Powells-place, for the School Board. Messrs. Morgan and Hodge, architects and surveyors, Prudential-buildings, Newport:—

T. G. Diamond ...	£2,885	E. Richards ...	£2,470
Jno. Moore ...	2,845	J. Phillips and Sons ...	2,467
Jno. Linton ...	2,725	C. H. Reed ...	2,400
Smith Bros. ...	2,604	Jas. Davies ...	2,399
E. C. Jordan ...	2,620	Tom Westacott ...	2,393
W. A. Linton ...	2,600	D. Jones ...	2,340
Wm. Moore ...	2,590	J. T. Morris ...	2,300
J. Charles ...	2,541	* Accepted.	

NEWSTEAD (Notts).—For the erection of Wesleyan Chapel and boundary walls. Mr. J. E. Goodacre, architect, Stockwell-gate, Mansfield:—
Greenwood ... £1,600 0 | Pogson and Tate ... £1,359 3
J. F. Price ... 1,572 18 | Thomason ... 1,350 0
Gilbert & Gabbetas ... 1,470 0 | Fisher Bros. ... 1,336 0
Wm. Rigley ... 1,402 0 | W. Bains, East Kirkby* ... 1,338 6

NORTHWOOD (Middlesex).—For the erection of a house, for Mr. Sampner. Mr. W. A. Aikman, architect, 34, Gresham-street, E.C.:—
F. Hill ... £874 | C. Eames, Watford* ... £829
* Accepted.

PLYMOUTH.—For the rebuilding of a store at the rear of George-street, for Messrs. Hicks and Co. Messrs. Keats and Coath Adams, architects, Plymouth:—
Griffin ... £740 19 | Goad and Co. ... £700 0
Andrews ... 735 0 | Lethbridge & Son* ... 654 0
Pearn and Son ... 715 0 | * Accepted.

PRESTON (Lancs).—For additions to workhouse, Fulwood, for the Union Guardians. Mr. Whitwell, Engineer, Union Offices, Preston:—

Contract No. 1.—Buildings.		Contract No. 2.—Heating and Ventilating.	
Wm. Hothersall ...	£1,799 0 0	J. Cartmell & Son ...	£1,537 0 0
Topping Brothers ...	1,670 0 0	M. Shorrock, Preston (accepted) ...	1,522 0 0
Fazackerley ...	1,127 6 11	B. D. Holmes ...	£650 0 0
Darque, Griffiths and Co. ...	487 11 0	C. Seward and Co., Preston* ...	422 0 0

SOUTHAMPTON.—For the execution of private street works, Regent's Park-road, &c., for the Corporation. Mr. W. B. G. Bennett, Borough Engineer, Municipal Offices, Southampton:—

Regent's Park-road.		Herrypool Estate.	
W. H. Bull ...	£3,488 0 0	F. Osman, Southampton* ...	£3,275 0 0
S. Nichols ...	3,313 0 0	H. W. Bull ...	1,666 0 0
S. Nichols ...	£1,722 7 11	F. Osman, Southampton* ...	£1,614 0 0

THEYDON BOIS.—Accepted for the erection of dairy, &c., at "Purleigh," Theydon Bois, Essex, for Mr. E. A. King. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C.:—

S. R. Lambel, Kentish Town ...	£295
WALTON-ON-NOVE.—For alterations and additions at the Victoria Hall, Hoe-street, Walthamstow, and building new Empress Theatre adjoining, for Messrs. Charles O'Malley and Warwick Buckland. Mr. Bertie Crewe, architect, Savoy Mansions, Savoy. Quantities by Mr. Harry E. Pollard, architect, 6, York-buildings, Adelphi:—	
Dearing and Son ...	£17,368
Johnson and Co. ...	£16,690
Patman and Fotheringham ...	17,065
Bateman ...	15,987
Kilby and Gayford ...	16,950
Gray, Hill, and Co. ...	15,990
Knigh and Son ...	16,813
Wattinson and Son ...	15,743

WANSFORD.—For additions, &c., to a house, for the Wansford-in-England Lodge of Oddfellows. Mr. J. C. Traylen, architect, No. 16, Broad-street, Stamford:—
L. C. Gilbert ... £235
Coates and Son, Thrapston (accepted) ... 210

WHITCHURCH (Devon).—For the erection of green-houses at "Hollybank," the residence of Mr. Edmund Coppin. Messrs. Keats and Coath Adams, architects:—
H. B. Fuge, Horrabridge ... £300

HALL'S

- SANITARY -

WASHABLE DISTEMPER

(PATENTED),

A NEW SANITARY WATER PAINT,

HAS great advantages, some of which are as follows:

It Sets Hard, Kills Vermin, and Disinfects.

It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.

It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black.

It only requires the addition of Water to make it ready for use, so that anybody can apply it.

It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalers and Ironmongers, and Manufactured by

SISSONS BROTHERS AND CO. Limited, HULL,

From whom Samples, Shade Card, and other particulars can be obtained.

FOREIGN AGENTS WANTED.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

THE WORKS AT HEYSHAM HARBOUR.

ALTHOUGH, no doubt, the Midland Railway does a not inconsiderable share of the carrying trade of the great ports of London and Liverpool, it stands almost alone among the great trunk railways in having no maritime interests of its own. This disadvantage of the Midland's has long been recognised by the public, as no doubt also by the Company's directors; for, at various times during the past twenty years, the Stock Exchange has been agitated by the rumour that the Midland was about to buy up the Furness line with a view to getting hold of Barrow, or to absorb the Hull and Barnsley as a means of capturing the great port on the Humber. Whether there ever was anything in these rumours is a state secret with the directors; but now a new departure is to be made, and in a few years the Midland will be in possession of a port which, with wise and liberal management, may soon take rank among the most important on our coast. However, everything which the Midland takes in hand in the way of works it does well, and the Chairman of the Company assured the shareholders, at their meeting a few weeks ago, that the works at Heysham harbour would be pushed on with the energy which is traditional of the board at Derby. The works at Heysham are already a mighty attraction to the thousands who this summer have sought for health and change of environment at Morecambe. Even to the Bank Holiday tripper a drive to Dawson City and Klondyke, the two navy camps which mark the two extremities of the scene of operations, has been very often the chief item in the day's excursion. And there is, indeed, plenty to be seen, and abundant room for imaginative conjecture as to what it all means. The first step towards the construction of a harbour was to make a railway to it, and this has so far been accomplished that Messrs. Price and Wills, of London, the contractors for the harbour works, have had the use of one set of rails for some months past. The line leaves the existing railway from Lancaster to Morecambe at a point about midway between the two towns, and then proceeds in a south-westerly direction almost in a straight line until it nears the shore a mile south of Heysham Church. No provision has yet been made for passenger stations, but the opening of the line for passenger traffic is pretty certain to result in the rapid exploitation of a considerable area of land in the neighbourhood of Heysham for building purposes, and it will be a good thing for the future if the local authority will from the beginning take broad views and insist upon a comprehensive and liberal scheme of roads and drainage. The place selected for the new harbour works is that bit of the coast comprised between the Near Naze on the north and the Red Nab on the south, the two points being about a mile apart. The two rocky points—reckoning the Far and Near Naze as one, the Red Nab being the other—form the bases from which spring two sea walls or embankments stretching out towards the west will ultimately nearly meet, like two in-curved horns, at a point rather more than half a mile from the shore. These two breakwaters will ultimately enclose a water area of 180 acres. They are very similar in shape, but the northern embankment will be 700ft. wide at the "root," and will gradually taper off to 50ft. in width at its seaward extremity; while the southern horn will only be 500ft. wide at the root, will stretch out rather further seaward, and will also be 50ft. wide at its outer extremity. In this way the head of the southern pier will almost mask the entrance to the harbour from the sea, and will give greater protection from the south-westerly swell. But the opening between the two pier heads will be 300ft., amply wide enough for vessels of large size to enter in any weather. The energies of Messrs. Price and Wills are now being directed to pushing forward the outlines at least of the

two embankments to their ultimate terminals, and to filling up the gap between the two pier heads by a temporary dam of clay and rock. The harbour bottom will then be covered by a network of railways, half a score of steam navvies will be set to work, and the two million cubic yards of excavation will be drawn out by locomotives, and tipped in train loads at the back of the present embankments. Although the contractors did not make a beginning until October last, they have already greatly altered the aspect of the ground in the vicinity of the new harbour. Some seven miles of substantial railway, connecting with the permanent line from Lancaster, have been laid down already by the contractors, so that the heaviest plant can be moved readily to any part of the works. About 600 men and an army of steam cranes are working night and day. A double line of rails has been laid along the shore at the base of the cliffs—if the word is admissible—and, as the rock is broken up by blasting, some dozen or fifteen steam cranes are loading it into wagons, which are rapidly drawn away by locomotives and run out to the extremity of one or other of the two breakwaters, and there "tipped." The largest rocks, masses of two to six tons, are selected for the outer face of the banks, which, of course, will have to bear the brunt of the autumn and winter gales. The stripping or "baring" of the rock is done by three steam navvies. Away out to sea the work of driving the piles where the embankment will ultimately be closed is progressing fast. Just now they look like a garden fence, but when the embankments have been made sufficiently solid and high to keep out the sea, the openings in the fence will be filled up. Sluices, by which the water may be drained off at low tide, but which will prevent its return with the rising tide, will be provided, and in this way the area within will be kept dry. The excavation of the harbour and the completion of the breakwaters will then proceed without fear of interruption. About forty-six acres of the harbour will be excavated to a depth of 14ft. at dead low water, the rest of the area being only partially deepened. Immediately opposite the entrance to the harbour a masonry pier stretching out 1000ft. from the shore, and having a width of 160ft., is to be built. This pier will have on it a passenger station, with lifts and subways to enable passengers to reach the steamers comfortably at low tide. There will also be separate subways and inclines for the landing of cattle at the root of the pier. On the inner side of the northern breakwater will be a quay for vessels engaged in the Scotch pig-iron traffic. The various cranes and capstans on the quays will probably be worked by hydraulic power, and the harbour will be lighted by electric light. The engineers responsible for the harbour works are Mr. G. N. Abefnethy, M.I.C.E., and Mr. J. Allen Macdonald, the Midland Company's chief engineer. Mr. Gerald Fitz-Gibbon is their resident engineer, and Mr. Fred V. Furniss is the representative of Messrs. Price and Wills, the contractors.

We wonder if the time will ever come when the Press will have no occasion to pay periodical attention to "the pollutions of the River Lea." They are old friends which turn up with the regularity of Christmas whenever there is a dry season. Of course, they are with us again, and are taking their most important share in producing the present "water famine," so called, in East London. The Company could get plenty of water from the Lea, but it is "so polluted, that only a very limited quantity can be dealt with by the filter-beds." Other causes of the failure of the water supply there are in those parts which must not be overlooked. The companies have great difficulty in communicating with one another, for one thing, which surely is a removable cause of drought. A much more serious trouble arises from the inability of the poorer inhabitants to find storage for water in their houses, and then from their incorrigibly wasteful habits.

THE EAST LONDON WATER SUPPLY.

THE East London Waterworks have discontinued their constant supply. Practically, the district served by the East London Waterworks is the only London water district that has a constant supply, and it is a very great question whether a constant water supply is an unmixed blessing after all. In all other parts of London the usual form of supply is what is called the intermittent supply. The water is delivered into cisterns, and it is calculated that these cisterns contain sufficient water for the daily wants of one family. This is, indeed, admittedly the case. Now we read that the East London Water Company has been compelled to reduce its supply to an average of 26 gallons per head of the population. When we take into consideration that in these districts people are not in the habit of taking a bath every day, and the male part of the population are generally employed out of doors, we shall at once see that this is not short commons, and cannot be described as a famine. The fact is there is a water famine, not only in London, but practically all over the length and breadth of England. The occurrences of these water famines in times of drought are very serious. Some people imagine that the whole question could be settled by tapping the lake districts and by supplying England with the waters of Welsh and other lakes. Apart from the great expense which this would entail, we doubt whether it would really provide a solution of the problem. What we have really to fight against is the wilful waste of water which goes on continually in our large towns, and goes on in proportions of which we do not form even an approximate idea. Dr. Smee, medical adviser to the Gresham Life Assurance Society, in a letter to the Times, maintains that "Constant service leads to waste," and that "it is impossible to prevent thoughtless people from leaving their taps running. A garden sprinkler," he says, "under ordinary pressure, will waste in twenty-four hours 10,000 gallons. Few people have any idea of the amount of water which is daily wasted. If only one tap was left running full bore in each house in London, it would require a daily supply of no less than 8600 million gallons, a quantity which the Thames and the whole of the rivers south of the Humber combined at the present period would be unable to provide." Dr. Smee very properly says: "It is absurd for persons to call a water supply reduced from 45 gallons to 25 gallons per head a water famine. There are many towns and districts in England that never exceed that quantity. The inconvenience of an intermittent supply has been caused solely from the want of adequate house storage. It is the jerry builders who, to increase their own profits, neglect to put into the houses they build proper cisterns. No house should be permitted to be inhabited which did not contain at least one galvanised iron cistern, protected against dirt, capable of holding 200 gallons, which would be sufficient with care for two days' supply for five people in an emergency. It is little short of criminal folly for school managers to build schools without providing adequate water storage; children attending schools should never be placed in a position of being without water because of a temporary failure of a supply, which may occur at any time, by a burst main, frost, or other cause. On the Continent the authorities compel householders to provide themselves with a tank of very large dimensions." The Local Government Board, it appears, does not require water companies to supply more than 20 gallons per head per population, and that is indeed a very sufficient quantity. When, however, we consider the enormous waste of water which is going on daily in our large towns, we shall be compelled to admit that this is becoming a very grave question.

THE SANITARY INSTITUTE CONGRESS.

PROGRAMME OF ARRANGEMENTS.

THE programme of the local arrangements for the forthcoming congress of the Sanitary Institute has now been definitely settled, and will shortly be ready for issue. The Sanitary Institute was founded twenty-two years ago, and incorporated in 1888. Sixteen congresses have already been held, and this year's meeting, which is to be held in Birmingham, will commence on September 27th, and terminate on October 1st. The objects of the Institute are to promote the advancement of sanitary science in all or any of its branches, and to diffuse knowledge relating to sanitation. With this end in view sessional meetings of the Institute are periodically held in London for the reading of papers and for discussions upon subjects connected with sanitary science. Papers and lectures having a distinct bearing on the subject are also read and discussed at the annual congress and sessional meetings, reports of which are printed and supplied gratuitously to the fellows, members, and associates of the Institute. With other information, including notes of Parliamentary blue-books and reports, the book forms a record of the most recent progress in sanitary science generally.

AS AN EDUCATIONAL INSTITUTION

the Institute does a valuable work. Courses of lectures and demonstrations for sanitary officers, specially adapted for candidates preparing for the Institute's examination for inspectors of nuisances, are held twice a year in London, and at intervals in the provinces. Other lectures on sanitary matters, such as sanitation of industries, and meteorology in relation to hygiene, are arranged by the Council from time to time. The study of the science is also facilitated by the Parkes Museum, which contains a great variety of the most approved forms of apparatus and appliances relating to health and domestic comfort, and a large library of valuable sanitary literature. For the convenience of visitors attending the congress the general reception room will be in the Town Hall. The conferences and sections will be held in the Mason University College, and the lecture to congress and the closing general meeting will also take place within the same building. The President's inaugural address and the popular lecture will be delivered in the large lecture hall of the Birmingham and Midland Institute, and the Council Chamber will be used for the reception of members of the congress. The formal reception by the Lord Mayor of the members will be made at half-past twelve o'clock on Tuesday, September 27th. For an hour later a public luncheon has been arranged at the Grand Hotel; and in the afternoon the President (Sir Joseph Fayrer, Bart) will deliver his inaugural address. In the evening there will be a large attendance at Bingley Hall, when the Lord Mayor will open

THE HEALTH EXHIBITION.

On the following day the members will settle down to business, and devote six hours to conference work. One section, over which the Lady Mayoress will preside, will deal with the important subject of "Domestic Hygiene." This conference is open to all ladies interested in the work. In the evening the Lord Mayor will give a conversation and reception in the Council House. The sectional meetings, three in number, commence in Mason College on the Thursday. The first will be devoted to the study of "Sanitary Science and Preventive Medicine," and will be presided over by Dr. Alfred Hill (city medical officer). "Engineering and Architecture" is the title of the subject in Section II., at which Mr. W. Henman will preside; and in the third section discussions will take place, having relation to "Physics, Chemistry, and Biology." This meeting will be held in the Biology Theatre, and the chair occupied by Dr. G. Sims Woodhead. In the afternoon the whole of the

members will reassemble, and attend, at the invitation of the chairman (Alderman Cook) and members of the Health Committee of the City Corporation, a garden party at the Botanical Gardens, Edgbaston. The same night Dr. Christopher Childs (Lecturer on Bacteriology in Relation to Hygiene at University College, London) will deliver a lecture to the congress. Friday, which concludes

THE PRACTICAL PART OF THE CONGRESS, will perhaps be the busiest day. The papers and discussions opened in the sections on the previous day will be continued. In the afternoon excursions will be made to Dudley Castle and the Wren's Nest, the Whitacre Pumping Station and filter beds, and Shustoke reservoirs and the Saltley Sewage Farm. At the respective places tea will be provided by the Earl of Dudley in the courtyard of the castle; Alderman Lawley Parker (chairman of the Water Committee), and Alderman Baker (chairman of the Tame and Rea District Drainage Board). The closing general meeting of the congress is arranged for five o'clock, and at half-past eight Dr. Alec Hill (master of Downing College and Vice-Chancellor of Cambridge University) will deliver a popular lecture. The chair is to be taken by the Lord Mayor. Saturday, on which day the congress terminates, will doubtless be interesting and enjoyable, excursions having been arranged for Stratford-on-Avon and Warwick, Malvern, and the Croft Granite, Brick, and Concrete Company, Leicester. At Stratford-on-Avon various places of public interest will be visited, including Shakespeare's birthplace and the Shakespeare Memorial buildings. The journey will then be continued to Warwick, where, at the Court House, in the afternoon the members will partake of the hospitality of the Mayor (Councillor Glover). His worship will act as conductor of the party at Warwick Castle. The visitors to Malvern will inspect the Abbey, British Camp, sewage farm, and waterworks. At the invitation of Earl Beauchamp and other residents, the members will take tea at the Imperial Hotel. Similar refreshment will also be provided at the Croft Works by the directors of the Company. The local General Committee, of which the Lord Mayor is the chairman, have made arrangements that members may visit the public institutions of the city and

A NUMBER OF MANUFACTORIES.

The latter include Messrs. S. Allcock and Co., Redditch (manufacturer of fishhooks, tackle, &c.); The Birmingham Small Arms Company (gunmaking), The Birmingham Electric Supply Company (power station), Messrs. Brinton, Kidderminster (worsted-spinning and carpet-making), Messrs. Cochrane and Co., Dudley (bridge and engineering work), Messrs. J. Cartland and Co. (brassfoundry and art-metal work), Birmingham Sewage Interception Department, Windsor Street Gasworks, the Dalton Street power station of the water department, the Central Fire Station, the Bradford Street Meat Market, Messrs. A. R. Dean (furnishers and decorators), Messrs. Elkington and Co. (electro-plate and art work), Messrs. J. Gillott and Sons (steel pen-making), Messrs. F. and C. Osler (glass blowing and cutting), Messrs. Osmund (cycle works), Messrs. Perry and Co. (pen-making), the Webley and Scott Revolver and Arms Company, the guardians of the Birmingham Proof House (testing of guns and all parts of small arms), Messrs. J. Hardman and Co. (stained glass painting), Messrs. A. Hickman, Limited, Bilston (pig-iron making and steel-making by the basic process), Messrs. Icke and Sharp, Limited (manufacture of confections), Messrs. Middlemore and Lamplugh (curriers' work, &c.). In the reception room ample arrangements have been made for the convenience of the visitors; and a special rate has been agreed upon by the railway companies for the conveyance of visitors within fifty miles of Birmingham.

EXTENSIVE improvements are to be made on the Mid-Kent (South-Eastern Railway) line, including new stations at New Beckenham and Lower Sydenham, the total cost to be about £10,000. The work has just been commenced.

Surveying and Sanitary Notes.

LONDON is by no means alone in the fear of approaching water scarcity. Official circulars have been sent out to Parisian householders intimating that in the event of a continuance of the hot weather the supply of spring water will have to be diminished or discontinued. The Parisians have in a large measure themselves to thank for this, since, with the advent of summer heat, they are given to a prodigal use of water for cooling purposes. In this case the punishment fits the crime very aptly, since the alternative is a recourse to the fragrant waters of the Seine, a fluid clear enough to look at, but absolutely poisonous in its impurity.

THE drainage question in Kingston is taking an unexpected turn. Some weeks ago we called attention to the prospective heavy outlay by the Corporation, necessary, according to the statements of members of the Drainage Committee, to meet the more stringent requirements of the Thames Conservancy, who were assumed to have raised their standard of purity for sewage effluents discharging into the Thames. This week, however, trustworthy information throws an entirely different light on the question. A prominent Kingstonian recently tackled a well-known member of the Conservancy Board on the subject, protesting warmly against the injustice of the Conservators in allowing the Corporation to erect sewage disposal works at an enormous outlay, accepting the effluent as satisfactory for ten years or more, and then suddenly raising the standard of purity and entailing further heavy expenditure on the already overburdened ratepayers of the borough. The Kingstonian was very much disconcerted by the reply of the Conservator, who denied that the standard of purity had been raised, and declared that if the Corporation would give them as good an effluent as they did ten years ago, the Conservators would be perfectly satisfied, but as a matter of fact the effluent had been deteriorating, and crude sewage had frequently been turned into the river. This is turning the tables on the Corporation with a vengeance, and the ratepayers will very properly want to know why they should be put to further outlay, when the existing works are capable of producing a satisfactory effluent, if proper supervision is ensured.

THOSE who drink water from a well had better not inquire too closely into what lies at the bottom thereof. When the sanitary officials at Dummer, near Basingstoke, cleaned out two of the village wells which had been open to the air of heaven for half a century, they brought to the surface no fewer than sixty-eight buckets, of all sizes and shapes, eight cartloads of bricks, and loads of rubbish of a miscellaneous and unsavoury sort. A little auction was held to dispose of the buckets. What is strange is that the health of the village has not suffered from impure water drinking, and the wells have always enjoyed a good reputation.

THE Strand has once more assumed its normal aspect, and one of the most popular thoroughfares in the world again resounds with the rumble of vehicular traffic. This year the time occupied in completing the re-paving of the thoroughfare was the shortest on record, namely, twelve working days, on two of which the workman enjoyed his Saturday's respite from toil. So speedy an execution of a necessary, though inconvenient, work is due largely to the elaborate preparations made by the Vestry of St. Martin-in-the-Fields. That authority wisely determined to defer the commencement of the operations until the whole of the 200,000 creosoted deal blocks were delivered in the Strand, or were within easy reach of it. By this means the delay experienced in some previous years through inadequate supply of materials was obviated.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

(Continued from page xxix.)

CARBURETTED, phosphoretted, and sulphuretted hydrogen are frequently found in air which has been heated in its passage over stoves or pipes of high temperature. These gases are then produced by the decomposition of floating particles of extraneous matter contained in the air. Carburetted hydrogen is frequently given out by gas stoves, in consequence of the escape of a portion of unconsumed gas.

The use of extremely hot pipes for warming in some instances causes decomposition of water, thus liberating oxygen and hydrogen.

Hydrogen in any form is injurious, as shown by the results of a self-inflicted experiment by a devoted investigator. In this case the inhalation of 30 cubic inches of hydrogen almost immediately produced oppressive difficulty of breathing, abundant perspiration, tremour, nausea, headache, and indistinctness both of vision and of hearing. Some of these symptoms lasted for a considerable time, and were not easily removed.

Another suicidal investigation, relating to carburetted hydrogen, resulted in numbness of the chest, loss of sensation other than a terrible oppression of the chest, followed by complete collapse, and very nearly by the death of the operator.

Ammonia occurs in the atmosphere in very minute quantities, from '0001 to '0006 per cent., and traces of other volatile substances

FIG. 6.

are also found, which may be regarded as accidental impurities due to local, but frequently undesirable, causes.

Vapour of water or moisture is invariably present in the atmosphere, where its influence is of the highest importance. By its aid the warmth of the earth is in great measure retained, and undue evaporation of moisture from the human body is prevented. The quantities of vapour in air vary considerably, in accordance with temperature and with local circumstances, but the capacity of air for moisture is dependent on temperature alone. In Fig. 5, the weight of water which a cubic

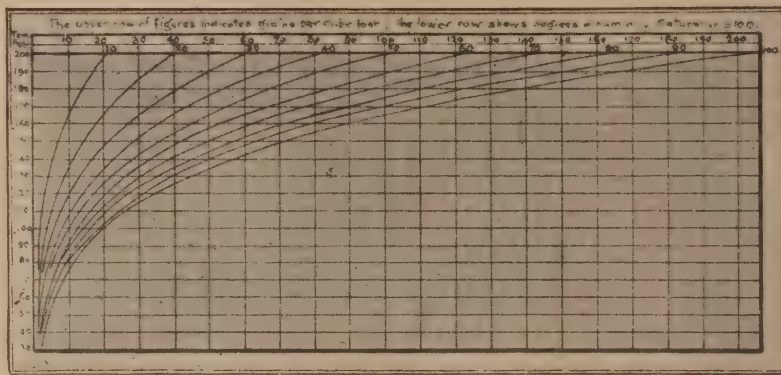

FIG. 5.

foot of dry air is capable of absorbing is indicated in grains for various temperatures by the lowest curve, whilst the other curves represent varying weights of water and degrees of humidity. When air is fully saturated it is said to be at its dew point, which represents 100 degrees of humidity; in England, at the greatest recorded dryness, air was found to retain 23 degrees of moisture, whilst in winter time it is frequently fully saturated. The following table, where saturation = 100 degrees, shows the sensible impression produced by various degrees of humidity:—

TABLE I.

85°	Damp.
65°	Moderately dry.
50°	Dry.
35°	Very dry.
25°	Excessively dry.

The mean humidity of air at Greenwich during the year will be seen by a reference to Table II. Saturation is, of course, represented by 100 degrees as before.

TABLE II.

Month.	Mean of 24 hours.	Mean of Daytime.	
		9 a.m. to 6 p.m.	2 p.m. and 3 p.m.
January	89°	86°	84°
February	85	85	81
March	82	79	75
April	79	68	64
May	76	71	66
June	74	62	58
July	76	67	63
August	77	70	66
September	81	76	68
October	87	81	76
November	89	86	85
December	89	86	84
Whole Year	82	76	72

In practice, the most convenient means of ascertaining the humidity of the air is by the aid of a hygrometer (Fig. 6), which consists essentially of two thermometers, one having the bulb covered with muslin, which is kept moist by capillary attraction through a thread or wick connecting it with a small water vessel. The degree of cold produced by evaporation of moisture in the muslin depends on the quantity of vapour in the air, and shows the percentage of humidity in accordance with Table III. Another form of hygrometer in which the linear expansion or contraction of a hair is utilized for indicating humidity is illustrated in Fig. 7.

It is sometimes recommended that in regulating the humidity of air in artificially heated rooms we should follow the example set by Nature. As a general maxim this may be excellent advice, but Nature working on the principles of true political economy does not invariably succeed in satisfying individual idiosyncrasies. Modifications become necessary because the aged, infirm, and sick usually require a degree of humidity higher than is necessary for the young and healthy. In hospitals, workhouses, and infirmaries, the most careful attention should therefore be paid to this point. Excessive dryness of air is in any case injurious, tending to cause a sense of fulness in the head, flushing, confusion of

ideas, besides coldness and langour in the extremities.

On the other hand, too great a percentage of moisture, combined with high temperature, is

TABLE III.—HUMIDITY INDICATED BY HYGROMETER (SATURATION=100°).

Degrees of cold.	Temperature of Air in degrees Fahr.						
	32°	42°	52°	62°	72°	82°	92°

19	—	—	—	26	30	33	36
20	—	—	—	24	28	31	34

equally prejudicial to health, owing to its interference with proper and natural evaporation from the skin and lungs.

As a general rule, from 50 to 70 degrees of humidity will render the air of a room com-

FIG. 7.

fortable and pleasant to its inmates, and the requisite moisture may always be readily furnished by the employment of evaporating pans and similar appliances.

Before passing away from the natural and foreign constituents of air, reference must be made to floating particles and organisms. The first-named are of a most cosmopolitan character, including soot and minute fragments

The electrical condition of the air exercises a considerable influence upon the inhabitants of dwelling-rooms, and it has been demonstrated that the amount of electricity existing in the atmosphere is by no means inconsiderable.

TABLE IV.—SUMMARY OF EXPERIMENTS BY DR. PERCY FRANKLAND.

Place.	Conditions.	Germes per sq. ft. per minute.
South Kensington Museum	During varying winds	851 to 1302
	After rain, ground, &c., wet	60 to 66
	During thick white fog	26 to 32
Royal Society Conversazioni, Burlington House	Commencement	240
	Later with increase of guests	318
	Next day, room empty	109
National History Museum, Kensington	Morning, small attendance	30
	Afternoon, larger attendance	293
	Whit-Monday, crowded attendance	1755
Hospital for Consumption, Brompton	Morning, few moving about	18
	Afternoon, more moving about	66
Norwich Cathedral	Spire, 300ft. elevation	49
	Tower, 180ft. elevation	107
	Ground level	354
St. Paul's Cathedral	Golden gallery	115
	Stone gallery	125
	Churchyard	188
Primrose Hill	Top	12
	Bottom	57

of animal and vegetable matter. As a rule such substances are so impalpable as to attract no special attention, although they become both visible and tangible in times of fog. Every perfect system of ventilation should provide for the efficient cleansing of air on its entrance into the building, and the adoption of appliances for this purpose will largely diminish if it does not absolutely eliminate micro-organisms.

Some of the latter are harmless, but other varieties are directly responsible for the spread of diseases, and both exist in varying numbers in the open air, in dwelling rooms and in public buildings.

Experiments made by Dr. Frankland furnish the interesting results, quoted in Table IV., as to the numbers of organisms falling per minute per square foot. From these data it

The earth is negatively electrical in relation to the air; and the air under normal conditions is positively electrical. In badly ventilated rooms the latter state is reversed, and thus the human body becomes charged with electricity which the air is not competent to carry off. The provision of abundant supplies of fresh air, possessing a proper degree of humidity, will always prevent any of the ill-effects which may otherwise be distinctly traceable to the cause here referred to.

Having now examined the constitution and characteristics of air, so far as physiological conditions are concerned, it is necessary to enquire as to the quantity of air required, under varying circumstances, to ensure entirely adequate ventilation.

In the determination of this point various factors must be taken into account. Amongst

TABLE V.

Condition.	Temp.	Oxygen.	Nitrogen.	Vapour.	Carbon Dioxide.	Total parts.
Before respiration	60°	20·26	78·00	1·70	0·04	100
After	90°	16·00	75·00	5·00	4·00	100

is abundantly clear that air intended for ventilation should either be drawn from a considerable elevation or washed before use. The effect produced by the increase of inmates in a room points to the desirability of providing spray-producing apparatus for use in hospitals, so that the air may be freed from dust and germs at certain periods.

internal causes of vitiation are classed the act of respiration and the action of lighting apparatus, in both of which oxygen is consumed in the production of carbonic acid and of water. Natural exhalation from the skin has also to be considered. In each case the gases and vapours given off are accompanied by heat, which requires a certain volume of

air for its removal. Under normal circumstances the changes effected in the constitution of air in a room by the function of respiration, are approximately shown in the subjoined table:—

External causes of vitiation, as affecting the relative proportions of oxygen, carbon dioxide, and vapour, must be borne in mind in every system of ventilation, as also the possible contamination of outer air by volatile and suspended products from chimneys, by the decomposition of animal and vegetable matter, and by miasmas sewer gases and fogs.

(To be continued.)

Trade and Craft.

“DENSITAS” CANE SANITARY WARE.

Messrs. Morrison, Ingram, and Co. Ltd., have just completed important additions, which have been in hand for nearly twelve months, at their Midway Pottery Works, Swadlincote, Derbyshire. These extensions, and the equipment of the works with up-to-date machinery, will enable the firm to double this branch of their business. The patterns have practically all been remodelled, and a great number of new designs added. It may be of interest to the trade and profession to learn that recent experiments prove that the Midway “Densitas” Cane Clay is, of all bodies, pre-eminently suitable for the manufacture of sanitary vessels. It is a clean, compact body, of nearly double the strength of fireclay, whilst its porosity is about a fourth less. It is anticipated that the “Densitas” Cane ware will occupy an important position in the future, as it is now evident it can be suitably substituted for iron in a variety of articles.

DR. S. W. WHEATON has presented to the Local Government Board a report with reference to the sources of water supply for Carnarvon, which has for some years past been unsatisfactory. The supply is obtained from the River Gwyrfa, which issues from Llyn-y-Gader as a large stream, and, three miles lower down the valley, falls into Lyn Quellyn. At the intake the water flows from a dam through copper gauze screens directly into an iron pipe, by which it is conveyed, without filtration, to a reservoir constructed 2½ miles outside the borough. Dr. Wheaton's inquiries led him to the conclusion that the work of preventing pollution of the Carnarvon water supply is a difficult undertaking, requiring constant vigilance over a very large area. Doubting whether filtration, as ordinarily carried out, can be trusted to secure a uniformly wholesome water, he indicates the further measures which are necessary, but expresses his preference for Lyn-y-Aywarthen as a source of supply which is almost entirely free from risk of pollution. At the present time the water of the last-mentioned lake is not used for any purpose.

Property and Land Sales.

HAMPTON AND SONS,

ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON AND SONS beg to announce that their AUCTIONS of LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C.

Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c.

List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to HAMPTON AND SONS (Ltd.), 1, Cockspur-street, S.W.; or by post, three stamps.

Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

GILLOW AND CO.

(Waring and Gillow, Ltd.),

406, OXFORD STREET, W.

(Established at the above address over 100 years),

HAVE a large and most desirable selection of all the best Shooting, Fishing, Hunting, and Winter Quarters in the Market, and will be pleased to submit a list of same free on application. Telephone No. 30, Paddington.

BERDESHIRE (24,158).—An excellent SHOOTING BOX, very nicely furnished, modern sanitation. The accommodation includes eleven bedrooms (making up fifteen beds), large nursery, bath room, w.c.'s and lavatory, and four reception rooms. Complete domestic offices. Three-stall stable, coach-house, harness room, loft and rooms over. Well laid out grounds, with two tennis lawns. Greenhouses and kitchen garden. September and October, 100 guineas inclusive.

BERKSHIRE (3122).—In lovely scenery, looking on the Downs and extensive Commons close at hand. In 3 acres of grounds, well timbered on all sides except the south, to which the house fronts. Contains dining room, drawing room, kitchen, three large bedrooms, one smaller; store cupboards, larder, &c. Stabling for three horses. Trout fishing in River Embourne, also good winter fishing. Shooting to be had in the neighbourhood. Plate and linen nearly new. Comfortably furnished.—Terms and full particulars as above.

Messrs. WALTON & LEE,

10, Mount Street, Grosvenor Square, London, W.

To Builders, Small Speculators, and Others.

SOUTHALL, MIDDLESEX.

A number of Valuable Freehold Building Sites, comprising a portion of the highly favoured building estate, known as "The Southall Building Estate," situated in the parish of Southall, about five minutes' walk from Southall Station on the Great Western main line, about twenty-five minutes by rail from Paddington, and thirty-five minutes by rail from the City.

The estate is laid out with a 45ft. road, planted with trees this autumn, sewered and kerbed and channelled; and house connections being laid up to the edge of the footpath.

The sites facing the High-street are eminently suitable for the erection of good class shops, whilst those facing the Lady Margaret-road are intended for villas with rentals of from £30 to £40 per annum, for which there is a great demand.

MESSESS. WALTON AND LEE will offer the above for SALE by AUCTION, at the Red Lion Hotel, Southall, Middlesex (about five minutes' walk from Southall Station), on WEDNESDAY, SEPTEMBER 21st, 1898, at SEVEN o'clock precisely in the evening of that day.

Particulars of sale may be obtained of Messrs. FRESHFIELDS AND WILLIAMS, Solicitors, 31, Old Jewry, E.C.; or of the AUCTIONEERS, at their offices, 10, Mount-street, Grosvenor-square, London, W.

FOR SALE.

FREEHOLD.—SANDFORD-HOUSE and ESTATE, Godshill, I.W.

Six rail stations within one to four miles. Matchless beauty, splendid views and soil, mild climate, majestic, rare evergreen trees, &c.

Either as one property, or in portions to suit buyers, viz.:

1. The HOUSE, with a beautiful cottage and any portion of gardens and grounds.

2. The FARM, with 60 acres good land, part adapted for building development.

3. The BUILDING LAND, skirting the High-road to Godshill.

4. The SEVEN perfect STONE COTTAGES.

5. The 12 ACRES of MARKET GARDENS, and several old and new orchards, &c.

6. The EIGHT GLASS FORCING HOUSES, splendid vineries, peach, tomato, cucumber, melon, and fig houses, &c.

7. The important matured NURSERY, several acres of rare trees, shrubs, evergreens, &c.

(Nos. 5, 6, and 7 are all going concerns.) Part of the purchase money may remain on mortgage. For particulars, &c., apply to Messrs. DOWSETT, KNIGHT, and Co., 3, Lincoln's-inn-fields, London, W.C.

Sales by Auction for the Autumn, 1898.—Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER

beg to announce that their AUTUMN SALES of ESTATES, Investments, Town, Suburban, and Country Houses, Business Premises, Building Land, Ground Rents, Advowsons, Reversions, Stocks, Shares, and other Properties will be held at the Auction Mart, Tokenhouse-yard, near the Bank of England, in the City of London, as follows:—

Tuesday, Oct. 11.

Tuesday, Oct. 25.

Tuesday, Nov. 1.

Tuesday, Nov. 15.

Tuesday, Nov. 22.

Tuesday, Dec. 6.

By arrangement, Auctions can also be held on other days in town or country. Messrs. Debenham, Tewson, Farmer, and Bridgewater undertake Sales and Valuations for Probate and other purposes of Furniture, Pictures, Farming Stock, Timber, &c.

Detailed Lists of Investments, Estates, Sporting Quarters, Residences, Shops, and Business Premises, to be Let or Sold by private contract, are published on the 1st of each month, and can be obtained of Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER, Estate Agents, Surveyors, and Valuers, 80, Cheapside, London, E.C. Telephone No. 503, Bank.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

R. I. B. A. SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PARTNERSHIP.—Young ARCHITECT good London training, DESIRES WORKING PARTNERSHIP in established firm. Is an able designer and draughtsman, with good practical experience.—Address, ARCHITECT, care of J. E. Farrar, Esq., Solicitor, Halifax.

HONOURS BUILDING CONSTRUCTION and HONOURS CARPENTRY.—Special classes for the above will be taught by Mr. H. BUSBRIDGE, A.R.C.S., Mem. San. Inst., at Westbourne Park Institute, Bayswater, and at Goldsmiths' Institute, New Cross, commencing last week in SEPTEMBER. Also separate Elementary and Advanced Classes at low fees.—For further particulars apply to the SECRETARIES, or to 43, Heavitree-road, Plumstead, S.E.

YOUNG ARCHITECT having a small Office in the City would be pleased to allow partial use of same.—F. T. B., Horncastles, Cheapside, E.C. 1

OLD OAK FRAMING from an Old Tithe Barn FOR SALE.—Apply, TAYLOR, East Isley, Berks. 2

APPOINTMENTS VACANT.

ARCHITECT'S ASSISTANT.—Wanted at once, a competent ASSISTANT.—Apply, with full particulars, to CHURCH, QUICK, and WHINCOP, Architects, William street, Woolwich.

ARCHITECTURAL ASSISTANT (first-class) WANTED. Must be a good draughtsman and designer.—Apply, stating experience, age, and salary. Good salary will be paid to a competent assistant.—Apply, W., Reform Club, Sheffield.

ARCHITECT'S ASSISTANT Required at once. Good designer and specification writer.—State age, experience, and salary required, to "Architect," Hooper and Batty, 15, Walbrook, E.C.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES TO ASSIST others in the PREPARATION OF DRAWINGS at his own office. G. SCOREE, 23, Newman-street, W.

HOSPITALS and INFIRMARIES.—Expert confidential ASSISTANCE. Formerly draughtsman for Local Government Board; highly successful in competitions, for which moderate speculative terms are offered.—G. B., Caen Cottage, Ryde, I.W. 1

A PRACTICAL SURVEYOR is open for ENGAGEMENT. Would superintend new buildings and also alterations. Would supply plans and buy materials at trade prices. Factories a speciality. First-class references.—Further information on application by letter, SURVEYOR, 114, New Cross-road. 1

ARCHITECT'S ASSISTANT DISENGAGED. Neat and rapid draughtsman. Good at construction, design from rough sketches, wide experience. 30s. a week.—S. ARNOLD KELLY, Stratheden, Hastings.

ARCHITECT'S ASSISTANT (30), fourteen years' experience, desires ENGAGEMENT. First-rate designer and draughtsman. Practical and experienced. Excellent references. Salary £3.—"J. S. E.," Donaldson-road, Kilburn, N.W.

ARCHITECT'S ASSISTANT requires ENGAGEMENT. Ten years' experience. Working and detail drawings, perspectives, specifications, competitions, &c. Excellent references.—S., 98, Blenheim-crescent, London, W.

ARCHITECT and SURVEYOR'S ASSISTANT (27) seeks immediate ENGAGEMENT. Good draughtsman. Also surveying, levelling, and estate work. Highest references.—A. B., 23, Great Quebec-street, Montague-square, W.

ADVERTISER desires APPOINTMENT; qualified Architect and Surveyor (M.S.A.); giving up practice. Highest references and testimonials. Successful competitor school and abattoir works. Expert planner.—"C. E.," Hughenden, Bradley-road, Trowbridge. 3

An Architectural Causerie.

Some Side-Door Views of Architecture.

PASSING through the streets of a fine residential city, or along country lanes, dotted with picturesque cottages, one is sometimes reminded of how large a part the labour of women has played in the maintenance of beautiful dwellings. Down by the garden gate stands the old housewife, who for fifty years has "kept the home together," as we say in a phrase of more than figurative meaning, and to whose daily scouring and polishing the preservation of the interior at all events is due. In and out of the side-door of the well-kept mansion flit one and another of the long train of housemaids, in whose hands the architect must finally leave no inconsiderable portion of his work, and on whose labour—unskilled and trivial though he may deem it—the future of the fabric will, to some extent, depend. Around our quiet old London chambers clatters the pail of the antique "laundress," so careful of the dull domestic traditions of the place, so jealous of the intrusion of sacrilegious residents into the Inn. Even the hallowed pavements of our churches have been worn, not only by saints' knees and pilgrims' feet, but by the hands of indefatigable "sisters" washing them from year to year, or at the worst, of those poor pensioners whose labours in the Sanctuary determine their place in the list for blankets and coals. In every branch of Architecture, but more especially in dwelling-houses, the woman's care of the finished structure counts for something in its history, and it is regrettable that her toil, so arduous and well-meant, has often been mechanical and unintelligent, sometimes even mischievous and disfiguring, and generally devoid of any appreciation of the building from the æsthetic side. There is undoubtedly a charm in the lightly curtained window and clean scrubbed floor, but who shall win woman from the sepulchral white hearthstone with which she smears our beautiful old grey doorsteps on a Sunday morn? Who will convert her from the use of the crude red ochre which she daubs upon the window-sill, or up the little brick path to the front door? To these queries Woman might perhaps retort that these pastes and washes were first devised to conceal the sins of the builder, Man, in putting down job lots of bricks and cheap cement where he should have used good stones or tiles. But the use of them has become a habit—one of the hall-marks of the careful housewife, making too often to the artist's eye a jarring note on some restful old frontage, rich in its own harmonious weather stains. This is but one instance of the misapplied labour which women often put into "keeping house." Their devotion to these services is chiefly of a sentimental nature, and their pride in a home has scarcely yet grown beyond the elementary virtues of cleanliness and order, supplemented by a primitive instinct for promiscuous ornament. Ignorant of the beauties of honest material (having been brought up, it must be remembered, on shams and veneers), and, without any sense of the properties of materials and the right treatment of differing surfaces, they go through a set routine of

scrubbing and "tidying" as their grandmothers taught them, till the routine becomes a tradition, which will need several generations of iconoclasts to break it down. It must be admitted that our house-builders have not until lately been at any pains to simplify the work of keeping the interior clean; assuming probably that the women occupants have nothing better to do. But, on the other hand, the architect may plead the general conservatism of woman in domestic arrangements, and her unreasoning suspicion of new ideas. Happily, however, a better understanding is now springing up between the housewife and the architect, owing largely to the better instruction of women in art and craftsmanship, and to their increasing interest in domestic hygiene on the one hand, and in decoration of the broader kind upon the other. Generally speaking, our middle-class homes are growing perceptibly more healthy and artistic year by year, though there are one or two points on which reversion might be made. Where, for example, is the broad interior window-sill of

old days on which one's book or work-basket could be comfortably laid; or, better still, the commodious window-seat wherein Mariana, and all our favourite heroines, were wont to sit? And are the narrow shelves of to-day a sort of vengeance for our grandmothers' habit of crowding the broad ones with knick-knacks and horrible objects under glass shades? Certainly their cupboards were more spacious and soundly built, with deep shelves and recesses suited to their larger and heavier wardrobes than ours. We take root less deeply, perhaps, than they did, and burden ourselves less with best china and superfluous clothes; but we should like what we significantly call our "spare" property to be well housed when out of sight, and to this end a good supply of cupboards appeals strongly to the feminine mind. But for the benefit of the household and visitors alike, the architect should make some clear distinction between the doors of cupboards and those affording entrance to a room. Who does not know the embarrassment of making (as he thinks) a speedy exit

AN ARCHITECT'S HOLIDAY ON A BICYCLE. MALMSBURY. SKETCHED BY E. W. SAMPSON.

from the house, and finding himself in the coal cellar? Who, stranded in the upper floors of a friend's house, has not fumbled vainly among a series of panels, and mistaken the linen closet for the lavatory? Again, it should hardly be necessary to insist that cupboards in the roof and under the stairs should be well lined against dust and soot, and open as nearly as possible opposite a window, that the contents and their condition may be clearly seen. Yet, after all, what can a man know of the ravages of dust in a house so long as Woman stands between him and that most insidious foe? Day by day she sweeps his floors and passages, dusts his mantelpiece, his chairs, his books and papers (waging eternal warfare with his own careful arrangement of them overnight). What if the kitchen flues leak a little into the rooms above, and the cupboards receive all the stray dust of the house?—the woman is sure to like tidying up, and besides, it is all in her time. So at least argues the speculative builder, whom both men and women are beginning to fight on common ground. Nothing could be more chastening to the youthful architect than to take a practical woman over his house and wait for her comments on his original designs. Probably the dainty little devices of structure or decoration on which he prided himself most will pass unnoticed, or be viewed from the grossest utilitarian standpoint. The fair critic will want to know "how you propose to clean that window," or "what about carrying a tea-tray round that corner of the stairs?" No doubt it is very good for us to have these stern checks put upon our adventurous fancy, and a committee of housemaids might profitably have a voice in the passing of our architectural plans. Yet what if these were to disagree, and a majority of "new" women block the bill by insisting on automatic window-cleaners and self-sweeping floors? The minority might then commission a house to be built on good old-fashioned lines, to prove that *they* were not afraid of house-work, and that scrubbed deal and polished mahogany might be put to worse uses than to keep "revolting daughters" in their sphere. No: the committee of housemaids would certainly disagree. A better alternative must be sought for; our architects must be encouraged to marry young. Unaccustomed, perhaps, to take more than a drawing-room interest in women's work, and never having had to wrestle at the price of breakfast with a smoky chimney or an obstinate range, they do not realise how much of the comfort and happiness of a household depends on the fitting-up of the kitchen and the ground floor. In the interests of the Profession and of domestic peace, we must wed them to a race of homely, middle-class girls, who will teach them in that best of schools, the family circle, the importance of building well-placed cupboards, walls that will hold nails, and chimneys that will "draw." E. W.

MR. ROBERTS, who was for several years borough surveyor of Oswestry, has resigned his office on his appointment as engineer of Cape Town.

PLANS have been submitted by four local architects to the Smethwick Technical Education Board for the new technical schools in Crockett's Lane.

THE site of the monastery of the Greyfriars at Winchester, which has since the Reformation been used as a field or a market garden, is now being utilised for building private houses.

SOME two years ago the Queen's statue at Bombay was defaced, and the stains could not be removed. Professor Gajjar, late of the School of Art, Baroda, has now deleted a large portion of the spots, and will in a short time restore the head and crown to their pristine state.

AN ANCIENT LIGHTHOUSE.

ABOUT 300 years ago a fire tower was set up at Tynemouth Castle for the warning and guidance of mariners passing along the coast or entering the Tyne. The lighthouse was purchased in 1840 by the Corporation of Trinity House under the Act of William IV. for the enormous sum of £124,678. Throughout nearly the whole of this lengthened period wood and coal fires have blazed and smoked from a tower in Tynemouth Castle, and it is said that for a time the light was maintained

ON THE TOP OF A CHURCH.

The fireplace is described by an old writer as "partly open and partly close and of a peculiar disposition. It is close at the top and towards the land, but open towards the sea with iron bars (in the nature of net-work, but without glass), through which the wind blows up the fire." In the early part of the present century the coal light was replaced by an oil light made up of several lamps with plated reflectors. This arrangement of lamps and reflectors, with various improvements introduced from time to time, has been in use ever since, and is, says a Times correspondent, one of the last remaining examples of the catoptric system in our coast lighthouses. The present four-sided tower, erected probably about 1777, is a conspicuous object from the sea, forming a familiar landmark and useful guide for all navigators frequenting that part of the coast. But, in spite of its usefulness, its antiquity, and the historic associations connected with it,

THE LIGHTHOUSE IS DOOMED.

The Tyne entrance has to be defended against a possible invader, and the easternmost point of land on the northern bank of the river, upon which stands the Castle, affords suitable area and position for defensive works. A tall, conspicuous tower, such as a lighthouse, would be a desirable mark for the enemy, and the military authorities have decreed that it must come down. Moreover, the firing of heavy guns close by is not conducive to the retention of quiet, order, and careful adjustment of lighting apparatus necessary in a lighthouse. It is said also that several ominous cracks have developed in the tower since the Woolwich infants have been playing around, all of which afford weighty reasons for the removal of the lighthouse. The Trinity Board was not disposed to abandon altogether the idea of a coast light in the vicinity, and, therefore, determined that they would

REPLACE THE TYNEMOUTH CASTLE LIGHT

with one of modern character with all the latest improvements. Accordingly a site three and a half miles to the northward was selected for a new lighthouse, on a tiny islet named St. Mary's, just off Curry Point, a rather more prominent headland than that of Tynemouth Castle. On this islet a noble tower, cylindrical in shape, has now been erected, 120ft. in height, surmounted by a dioptric illuminating apparatus of elaborate design and admirable execution. The characteristic of the light is that it will show two powerful flashes in quick succession every twenty seconds, the intensity of each flash at full power being calculated as 121,500 candles. The illuminant is mineral oil, with a flash point of 145deg. Fahrenheit, burning in a lamp with five concentric wicks. The flame of this burner is adjusted to the centre of the splendid optical apparatus surrounding it; and, by means of refraction and condensation, the issuing flashes are brought up to the power mentioned. This system of group flashing is that invented by the late Dr. Hopkinson. The huge structure of glass and gun metal, weighing about 3½ tons, is caused to revolve in a circular trough of mercury, the mercury necessary for floating this great weight being only 7cwt. 2qr. 10lb. Friction is thus reduced to a minimum, and the apparatus can be rotated by a push of the finger, when its own momentum will carry it round two or three times. The light in clear weather should be visible seventeen miles. The manufacturers of the optical apparatus are Messrs. Chance Brothers and Co. Limited, of Birmingham.

IS LONDON BEAUTIFUL?

WAS is not Ouida who wrote an article some little time ago complaining of the ugliness of London? Many people fresh from Paris and from other Continental capitals find a pleasure in drawing unfavourable comparisons between them and our vast metropolis. I have no sympathy, says a writer in the Echo, with criticism which is simply captious and conceited, and thinks it a mark of superiority to differ from other people and to cultivate an attitude of *nil admirari*. Is there not, however, some truth in this criticism? Would anyone say that the word beautiful can be applied to five-sixths of

THIS VAST WILDERNESS OF A CITY?

Paris supplies the obvious comparison. Now Paris is undoubtedly a far more beautiful city than London. She does not give such an impression of Imperial power and incalculable wealth as is afforded by London, but she is pre-eminently picturesque even to her remotest outskirts. The Parisian slums, however dilapidated and tawdry, are never hideous and squalid. Their tattered balconies and broken stucco have always a touch of elegance just as the poorest Parisienne retains in her rags or coiffure some relic of taste and fashion. The houses are so built originally that they are

PICTURESQUE IN THEIR RUINS.

You will look in vain throughout the length and breadth of Paris for anything so hideous and slummy as the Blackfriars Road or the New Cut, with their mean and meaningless brickwork, their shocking uniformity and their depressing alternation of shop and public-house. To me the most revolting spectacle in London, the real authentic deformity, is your gin-palace, with its foul contrast of splendour and squalor, its lurid glare, vulgar and vicious as the paint on a harlot's cheek. The old-fashioned coffee-house or tavern is

RAPIDLY BECOMING OBSOLETE,

its place being taken by the glittering bar and the voluptuous saloon. I am often annoyed by the sight of a certain public-house which I will not mention. The building is itself quite a beautiful architectural study, startling in its contrast with the mean slums around. Its long and elegant windows, its beautiful decoration, its air ever of mystery and romance, would make it worthy of the streets of Verona. It might be the home of an artist or some wealthy burgher with artistic tastes. But look below. Its ground-floor is ablaze with a well-lit drinking-bar, in which poor folks are fuddling themselves with glasses of beer.

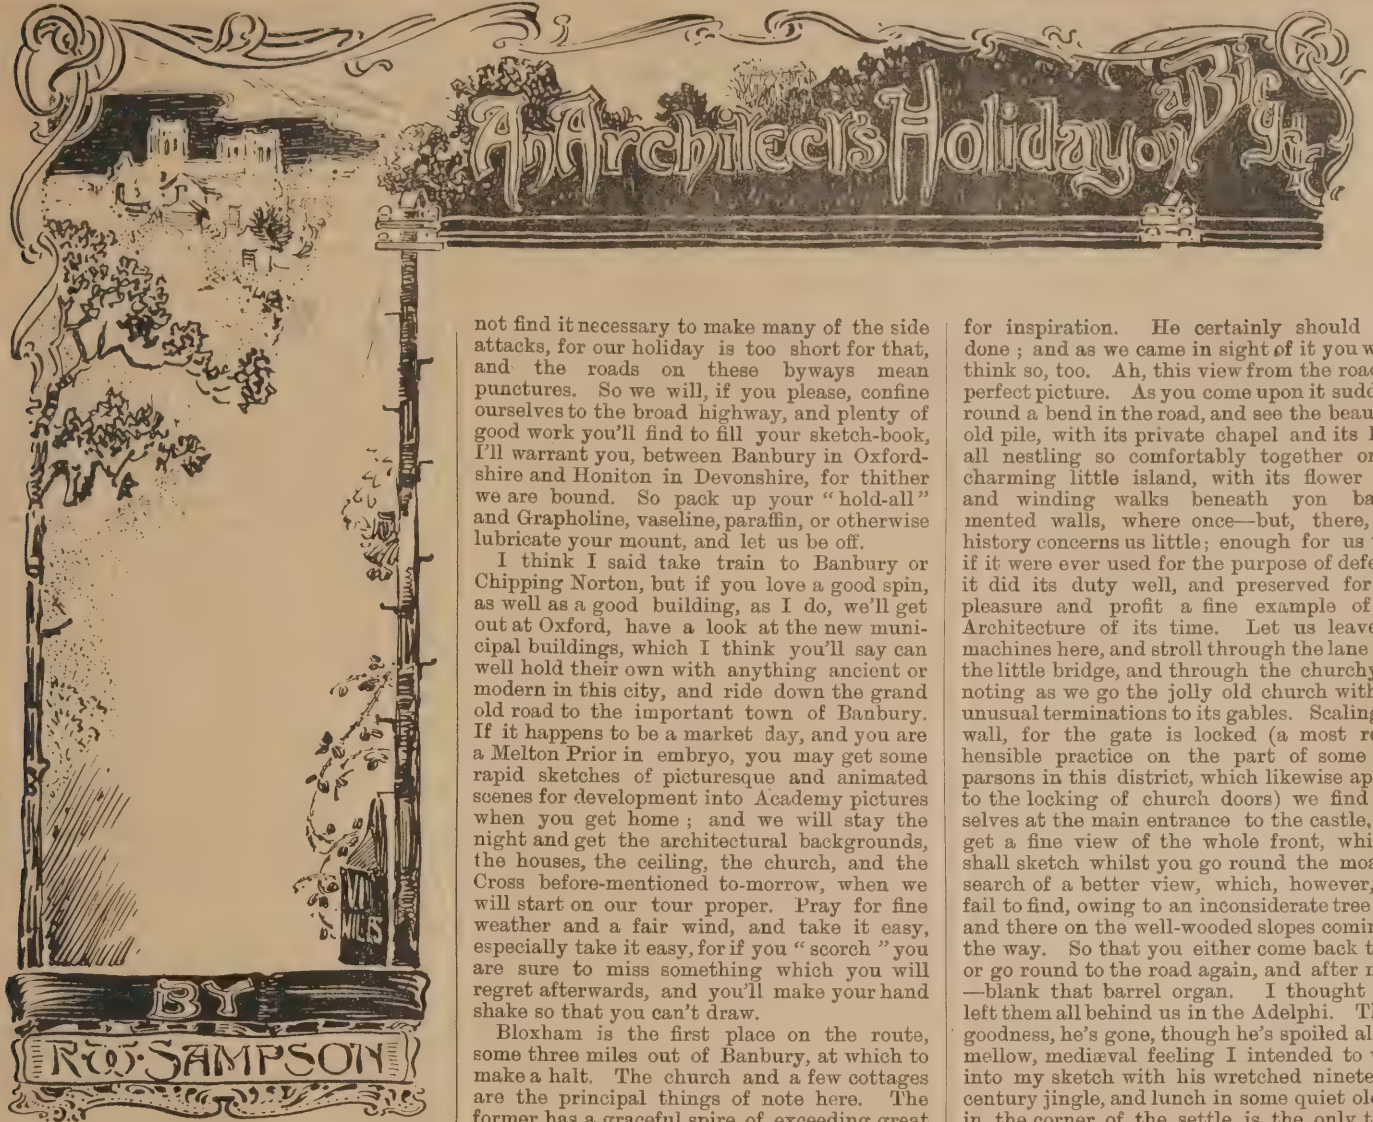

ABOVE IS ART AND BEAUTY

and mystery; below is squalor, and drink, and glare. The relics of London's former beauty are rapidly disappearing. We know how beautiful Cheapside was three centuries ago. The City has developed at a terrible expense of interesting and beautiful Architecture. It is no use complaining. These sacrifices have been inevitable. But surely we may express a hope that we shall not always consider a regard for beauty as a foolish and impracticable sentiment, nor be content that our great Imperial and commercial Metropolis shall embrace so many dark and dismal places.

SIR WILLIAM HARCOURT, on October 26th will open the new portion of the University College of Wales at Aberystwyth, erected at a cost of nearly £20,000.

THE Local Government Board has sanctioned the borrowing of £100,000 by the Liverpool Corporation, to be expended on the extension of the museum and new technical schools.

The rebuilding of Whitfield's Tabernacle, Tottenham Court Road, is proceeding apace, and the foundations have been laid in concrete several feet thick. It has been discovered that the original building was erected on mud with timber placed upon it. Consequently the wisdom of pulling it down is held to have been abundantly justified. The hall under the church will soon be completed, and the foundation stone will probably be laid in October.

not find it necessary to make many of the side attacks, for our holiday is too short for that, and the roads on these byways mean punctures. So we will, if you please, confine ourselves to the broad highway, and plenty of good work you'll find to fill your sketch-book, I'll warrant you, between Banbury in Oxfordshire and Honiton in Devonshire, for thither we are bound. So pack up your "hold-all" and Grapholine, vaseline, paraffin, or otherwise lubricate your mount, and let us be off.

I think I said take train to Banbury or Chipping Norton, but if you love a good spin, as well as a good building, as I do, we'll get out at Oxford, have a look at the new municipal buildings, which I think you'll say can well hold their own with anything ancient or modern in this city, and ride down the grand old road to the important town of Banbury. If it happens to be a market day, and you are a Melton Prior in embryo, you may get some rapid sketches of picturesque and animated scenes for development into Academy pictures when you get home; and we will stay the night and get the architectural backgrounds, the houses, the ceiling, the church, and the Cross before-mentioned to-morrow, when we will start on our tour proper. Pray for fine weather and a fair wind, and take it easy, especially take it easy, for if you "scorch" you are sure to miss something which you will regret afterwards, and you'll make your hand shake so that you can't draw.

Bloxham is the first place on the route, some three miles out of Banbury, at which to make a halt. The church and a few cottages are the principal things of note here. The former has a graceful spire of exceeding great height. As the local sage hath it who composed the lines which run: "Bloxham for length, Adderbury for strength, and Sutton for beauty," it is open to question whether these sentiments so expressed are actually justified, and if you like to satisfy yourself on the subject you may easily do so, for Adderbury is but three miles to the left of us, and King's Sutton five. By-the-way, you passed through Adderbury on the road from Oxford, but may not have noticed the church, which is somewhat round the corner from the main road. However, as we really must make a digression to the right of us, and go one mile off the main road to Broughton, perhaps you'll take my word for it that the aforesaid local sage was near enough to the truth to satisfy the man in the street. Adderbury is certainly strong, Bloxham is decidedly long, and Sutton—well, is pretty. Bloxham, taken all round, is the best of the three; built in the latest period of the Gothic age, there is originality, and at the same time, a feeling of decadence in the detail, such as you may have noticed in some other churches in this district. Chipping Campden is one that occurs to me, buildings which seem to me to possess the germ, though quite undeveloped, of the work we all admire so much of the late Sedding. Yes, certainly, it is worth sketching. The difficulty is to know whether to take it from the bridge at the bottom of the hill or from the other side near the railway station. Then I shall go round the corner to that charming old moated grange, Broughton Castle.

Talking of moated granges reminds me of a yarn of the early days of Christmas cards. A printer was showing some of his specimens to a gentleman, who remarked, on looking at one of the Leader sunset order, that the designer must be a clever artist. "Well," says the printer; "I dunno about being a hartist, but 'e's the finest moated grangest in the trade!" Well, I wonder if he came to Broughton Castle

for inspiration. He certainly should have done; and as we came in sight of it you would think so, too. Ah, this view from the road is a perfect picture. As you come upon it suddenly round a bend in the road, and see the beautiful old pile, with its private chapel and its keep, all nestling so comfortably together on its charming little island, with its flower beds and winding walks beneath yon battle-mented walls, where once—but, there, the history concerns us little; enough for us that, if it were ever used for the purpose of defence, it did its duty well, and preserved for our pleasure and profit a fine example of the Architecture of its time. Let us leave the machines here, and stroll through the lane over the little bridge, and through the churchyard, noting as we go the jolly old church with the unusual terminations to its gables. Scaling the wall, for the gate is locked (a most reprehensible practice on the part of some few parsons in this district, which likewise applies to the locking of church doors) we find ourselves at the main entrance to the castle, and get a fine view of the whole front, which I shall sketch whilst you go round the moat in search of a better view, which, however, you fail to find, owing to an inconsiderate tree here and there on the well-wooded slopes coming in the way. So that you either come back to me or go round to the road again, and after much—blank that barrel organ. I thought we'd left them all behind us in the Adelphi. Thank goodness, he's gone, though he's spoiled all the mellow, mediæval feeling I intended to work into my sketch with his wretched nineteenth century jingle, and lunch in some quiet old inn in the corner of the settle, is the only thing that will bring us back to the frame of mind for the true appreciation of these grand old works of our forefathers.

Having refreshed ourselves after our labours at Bloxham and Broughton, we will proceed on our way to Chipping Norton, a distance of eight miles or so. We only pass through one village on the way, which does not seem to call for our special notice. Just this side of Chipping Norton we shall pass the demesne of Mr. Albert Brassey, where you may see one of Sir Arthur Blomfield's scholarly churches, and also some of Mr. Waterhouse's equally circumspect design in the house; but as that is hardly what we came out to see, we will jog on to Chipping Norton, an ancient market town, with a mayor and corporation. There are cloth mills here too, but little of architectural interest to detain us; the one wide street, the market-place, can hardly be called picturesque, though there is a certain old world air about it; so, unless you are tired, and prefer to stay this night at the White Hart, we will get on to Shipton. We may go either by Churchill, or more directly by the Shipton and Burford road; the latter, I think, is our best way. Churchill is a nice little village, but as you have, no doubt, seen and sketched Magdalen Tower in Oxford, you won't be interested in seeing a more or less good copy of it to a small scale at Churchill, and that is its principal feature from our point of view.

Shipton—which to save confusion with the many other Shiptons—is called Shipton-under-Wychwood, will give you plenty to do if you care to stay. There is the Court, a stately old mansion, out of which many of the mullions have been cut from the windows to make room for great staring sashes; nevertheless, there is much left which is worth noting. There is a somewhat formal garden and a very fine avenue and some good bits of ironwork about.

The church (one of Mr. Street's earliest restorations) with a fine Early English spire,

If you have a week to spare, or, better still, two, a bicycle, and an artistic thirst which can only be quenched by long and deep draughts of the elixir of life contained in the architectural vintages of the Middle Ages, take my advice and put yourself and all that is portable of these things in the train at Paddington, and take them down to Chipping Norton Junction, or perhaps Banbury, and follow me through country and over roads which, with but few exceptions, seem to have been constructed in those far off days of their making for the architectural cyclist.

Banbury, of course, you know by heart. If, however, you don't, you will be disappointed at the start by the poorness of the Cross you heard so much about in your childhood, and furthermore, ladies on white horses are things of the past. But the church, reminding one so much of the City of London churches, and a good one at that, is well worth seeing, though, to my mind, a classic church of so severe a type, is out of place in a country town; but you will find some jolly old houses, with shops beneath, wherein cakes of the original description may be had, that will compensate you for any disappointment the church or the cross may afford you, and a room with a glorious ceiling at the inn, wherein one of the Charles (I forget which) held council, is worth much travel to behold.

Perhaps before starting on the journey you would like to know where it is going to end. Well, the road I purpose traversing runs through no less than five counties, and the distance is about 150 miles, more or less, according to the number of digressions we may make to see something which is only just over there, as one may say, which may mean anything from a mile to five, though we shall

with a very large ball on the top and a very small vane, is of interest, and well worthy of your attention; and the Crown Inn has a well shaped Tudor arch to its entrance, which is all very interesting. To Burford is a ride of five miles over the Downs, where, to the right of us, at a distance of about a mile, are the quarries which claim to have supplied much of the stone for the interior of St. Paul's Cathedral. Fullbrook, with its tiny little church lately restored, is passed, and Burford comes in sight climbing up the hillside yonder, on the top of which runs the old London road. As we get nearer we make out the grand old church—one of the finest we shall meet with—with its long nave and chancel and graceful tower and spire, which alone decides you to make a long halt, even if you are not aware of the other treasures in the Priory and in every street which are to be found there. Yes, you may stay here some time, one, two, or three days if you like, and still find plenty to interest you. Perhaps the best way will be when you are refreshed, and have had a general look round, to call on the Vicar, the Rev. Mr. Cass, whom you will find a genial and instructive as well as a willing guide, full of wit and good humour, with stories of Street and Morris, the former of whom restored the church, to be practically damned by the latter for his manner of so doing. The church is a veritable treasure house, and in it there are examples of every period from the Norman arches to the tower, to the Grinling-Gibbons looking monuments on the walls. I shall sketch that one in the corner of the south transept, behind the organ; it is a sweet bit of modelling, although the cherubs have a somewhat Irish cast of features and their melancholy expressions—doubtless in accordance with the feelings of the bereaved ones. These cherubs are somewhat apt to appeal to the sense of humour in the ordinary beholder, and cause him to smile. In the meantime you may go and make a note of the south porch, with its groined ceiling, or the fine old Perpendicular family pew over there, or that peculiar corbel in the south aisle, or all or any of the fine work this church contains, and, when you've done, we'll walk up the street, and look at those beautiful old gables just above the Bull Hotel and the Gate House at the corner of the road opposite, along which we shall take our way to our next stopping place. It is in Shipton we see the finest specimen of the blacksmith's art we are likely to meet with on this journey—those railings and gate, now doing duty at the entrance to a Wesleyan chapel, of all places in the world, though, fortunately, it is only the name of these enemies to Architecture that jars on one, for with the gates they took the house behind which is a good old place enough, with its fluted, Corinthian pilasters and its well proportioned door and windows.

(To be continued.)

MEMOIRS OF AN OLD STREET.

KING STREET, Westminster, once one of the most famous streets in the world, has for a long time been under an eclipse. For several centuries the pageantry connected with Court, Parliament, and Abbey, with sterner and sadder processions associated with Westminster Hall and the Abbey, passed along its narrow way and through the two picturesque gates which spanned it. Holders of some of the most notable names in history have here found a lodging; but when Parliament Street was cut across the old Privy Garden, King Street, shorn of more than half its length, became a mere back street, the very existence of which was forgotten by most people. Aggas's map, *temp.* Queen Elizabeth, shows us that King Street extended from the Tilt Yard (opposite the site on which Inigo Jones built

THE NOBLE BANQUETING HOUSE

as a first instalment of the magnificent palace projected by Charles I.) to nearly where it ends at the present time. Holbein's beautiful gate (sometimes called the Cock-pit Gate) stood at the Tilt Yard end, and was not demolished till the year 1759; the second gate, known as King Street Gate or Westminster Gate, stood at the southern end of the Privy Garden. The Countess of Buckingham, mother of George Villiers, Duke of Buckingham, whom Felton stabbed to death, had

lodgings in this gate, and hence her body was borne to be buried in the Abbey. The Earl of Rochester was a later dweller in the gate, which stood till 1723. Opposite the south end of King Street was a third gate, sometimes known as

WESTMINSTER HALL GATE,

which gave entrance to Palace Yard. In the space in front of this gate the pillory was often set up. One of our earliest printers—the fourth chronologically—Julian Notary, was “dwellynge in Kynges Street, A.D. 1500,” when he printed the “Book of Devotions.” Elizabeth's famous admiral, Lord Howard of Effingham, lived here, and the meetings of the Privy Council often took place in his house. In 1611 Sir Henry Wotton had a lodging here, where, with his few books, he passed his time, “more attending the study of truth than of humour.” Another bookish resident was Bishop Goodman, when spending his days with the Cottonian Manuscripts in Ashburnham House near at hand. Poetry has representatives in Edmund Spenser, the poet's poet, who died here—“for lake of bread,” Thomas Carew, the friend of Ben Jonson and Suckling; and that Earl of Dorset whose name lives in “To all you ladies now on land,” and other lyrics; Erasmus Dryden, brother of “glorious John,” dealt here as a grocer before he became a baronet. Science claims Dr. Sydenham; the stage, Anne Oldfield. Dudley, Lord North, who died in 1677, had a “sorry” house in King Street, remarkable for being

THE FIRST AND ONLY BRICK HOUSE

in that street for many years. Oliver Cromwell had a house here, traditionally said to have been near Downing Street; it was here he wrote to his wife from Dunbar; and here, too, in April, 1648, that he vainly strove to reconcile the chiefs of the Parliament and the Army. “They would not draw together at all.” Cromwell's mother also was lodged in a house to the north of the gateway entrance to Blue Boar Yard, and she was borne hence to be buried in the Abbey. The house has long since disappeared; the Blue Boar was rebuilt in the eighteenth century, but the yard and its entrance still exist, so that the site can still be exactly located. The memoirs of an old street like this, says the Westminster Gazette, summon before us innumerable phantoms of the past, and bring us into touch with the burning question and momentous incidents of bygone days. The north side of King Street has been already demolished, together with the greater part of Parliament Street. The rest is to follow to make a site for the new Government offices, to be built from the designs of Mr. Brydon.

A NEW Baptist Church in Florence Road, Preston Park, Brighton, has been opened.

BROUGHTON CASTLE

EAST RIDING ANTIQUARIAN SOCIETY.

MONUMENTAL EFFIGIES: WATTON ABBEY.

THE annual general meeting of the East Riding Antiquarian Society took place last week. The business routine was prefaced by a public dinner, at which Mr. St. John Hope made some interesting remarks on the subject of effigies. Mr. St. John Hope said the Society of Antiquaries were anxious to compile a list of the monumental effigies which existed in this country. There had been published a charming book on "The Monumental Brasses of England and Wales," by the Rev. Herbert Haines, but no such book had been written on monumental effigies. The county of Yorkshire was rich in those interesting memorials. Indeed, one of the minor schools of sculpture in England appeared to have been in Yorkshire—it may have been in York, but there was no record. He had accompanied that society on a number of their excursions, and he had been surprised and pleased to see the number of

INTERESTING AND CURIOUS EFFIGIES that existed in the East Riding. It would be a most useful thing if, whenever the society visited a church which contained an effigy, certain members would undertake to record the circumstance and photograph the monument. The Society of Antiquaries did not wish to restrict their list simply to the recumbent figure; they wished it to include everything that represented a man's head or his effigy generally—anything that partook of the nature of effigies down to what he might call the present-day postage-stamp busts on the walls of churches. The scheme covered a wide field, and he commended the subject to the notice of the society. By way of helping matters forward, a small committee had been appointed to draw up a sort of handbook on the study of monumental effigies which would classify different types of armour, different types of ecclesiastical figures, and different types of secular figures, and suggest the best ways of describing them. The President had spoken of parish registers. The interest in a parish register was purely local,

and it mattered little outside a particular village what the register contained. But there was one interesting set of parish books which was often, indeed almost universally, overlooked. He referred to the ancient churchwardens' accounts, which contained a good deal that was of more than local interest. They gave information as to local customs, of which we had in some cases no other record, as to church furniture, and as to the cost of work upon the buildings. There were many examples in which antiquaries would give almost anything to have the churchwardens' accounts—he need only mention St. Mary's, Beverley, for one. It would be well if the society made a systematic inquiry after the churchwardens' accounts in the churches they visited.—During subsequent proceedings Mr. St. John Hope gave an address on the interesting subject of Watton Abbey, the foundations of which were disclosed by excavations two or three years ago. Mr. Hope said there were yet many points in the history of the abbey to be cleared up, and before the paper which he had promised the society could be written and put into a final and readable form, it would be necessary

TO CARRY OUT FURTHER EXCAVATIONS.

The abbey had belonged to the remarkable Gilbertine Order, which was originated by a rector of Sempringham, in Lincolnshire, who provided this foundation for some ladies of his parish who were desirous of leading a religious life. This monastery, if it might be called so, was literally a place of entire seclusion, and those ladies having retired to it never left it. In order that they might receive the necessities of life certain lay sisters were appointed to wait upon them, and those sisters brought food to the nuns and put it through a small window or hole in the outer wall of the monastery. But Gilbert, the founder, concluded that this was not a desirable state of things, as it made it possible for the lay sisters to hold conversations with the secluded ladies on secular matters, and disturb the current of their thoughts towards higher things. Thus it came that the lay sisters also entered the monastery to perform their duties within, and without they were replaced by a number of lay brothers who attended to the external affairs of the nuns. But that arrangement also raised

difficulties. It occurred to Gilbert to get over them by attempting to model his new establishment on the lines of the great Cistercian Order, which was then in a flourishing condition. He applied to that Order to take those sisters under their charge, but the abbots of the Order refused. Gilbert then drew up a code of rules based on those of the Cistercians. But in the case of the Cistercians a certain number of monks were priests who ministered to the wants of the community, but in the case of the ladies that was a difficulty that had to be got over. Gilbert decided to attach to each of his foundations—for that at Watton was only one of seven—a small college of from seven to thirty canons. Those chaplains were bound by the rule of St. Austin or Augustin. The rule was extremely exacting in laying down restrictions that were framed to keep the two sexes apart. In the church a wall was built between the canons and the nuns so that the one sex could not see the other. The Gilbertine Order did not appear to have made great progress in England. Only twenty-six monasteries of the Order existed; half of them were mixed. At the dissolution of monasteries only three existed as double houses, and of these three Watton was one.—Mr. Hope then proceeded to describe in detail the excavations at Watton.

THE floor of a room in a bookseller's shop in Holywell Street fell through recently into the smoking room of the Opera Comique. The room had been used for the storage of paper, some five tons of which were precipitated through the ceiling below.

MR. G. J. FRAMPTON has just submitted for the Queen's inspection the small model of the colossal statue of Her Majesty which he has been commissioned to execute for Calcutta. The statue will, when completed, be erected in front of the Government House. It will be the Jubilee memorial provided by British and native subjects of the Queen in India.

A FEW days ago a large portion of the front of the Branksome Hotel, Bournemouth, which is being converted into shops, fell into the street. The sound of the downfall of hundreds of tons of brickwork and masonry alarmed and attracted a large crowd. Fortunately no one was injured. The structure was being underpinned, and a foundation pier gave way.

ART IN ENGLISH CHURCHES.

CHURCH CONGRESS week, which commences at Bradford on September 27th, will give the Clergy and Artists' Association another opportunity of exhibiting samples of work executed under their auspices. This will be the third year of the exhibition. The Association aims at raising the standard of Art in English churches. Anything from an embroidered stole to a steeple comes within their scope, which is practically unlimited, and it is for the purpose of showing what great improvements can be effected both in the interior and exterior of churches that this exhibition of working drawings will be held. It is an indisputable fact that many of our churches are devoid of that grace of outline and interior decoration which ought

To ADORN ALL SACRED EDIFICES, and the Association have set to work to gradually bring about a much-needed reform by submitting to those who ask for advice the names of artists whose work "is really representative of the new impulse which is growing up to a more living Art in churches." And as such famous artists as Sir W. B. Richmond, Mr. G. F. Watts, and Mr. Holman Hunt take a keen interest in the Association, the commendable task should be attended with success. Since the Association was started three years

ago, upwards of a hundred applications for advice as to church decoration have been dealt with. The committee merely recommend an artist; they do not, of course, tell the artist what to do, and in all the instances that have come under the notice of the Association a material improvement has been effected. All this must eventually lead to

THE REMOVAL OF UGLY STRUCTURES and tawdry interior decoration. The display of things beautiful will go a great way towards persuading people to abolish the unsightly—particularly what Mr. Holman Hunt calls the "galvanised puppets." In the forthcoming exhibition, which will be held in the Bradford Art Gallery, a large variety of drawings will be on view. They will include, says the Daily Mail, drawings for a pulpit, cartoons for stained glass, sketches for decoration of a chancel, designs for an altarpiece, sketches for windows, plaster models, embroideries, and photographs. Artists are invited to submit examples of their work. Altogether the exhibition should be fruitful of valuable results and help to increase the Association's sphere of usefulness.

AFTER having been radically altered, completely redecorated internally, and greatly improved, St. Patrick's Roman Catholic Church, Edinburgh, has been reopened.

Public Hall Decoration at Glasgow.

THE redecoration of the interior of St. Andrew's Halls, Glasgow, has just been completed by Messrs. J. B. Bennett and Sons. In the redecoration special care has been taken to harmonize the colours with the brilliancy of the electric light. No less thoughtfully have the entrances been treated. The main entrance is richly decorated with blue panelings on the ceiling, relieved with gold and ivory bands. The cornicing is of crimson and gold, with neutral tints painted on the bands. The walls are wholly painted a Pompeiian red and the woodwork dado as rich teak, while the highly decorated architraves are of ivory colour, with a background of gilded ornament and bands of gold. The other entrances are similarly treated. Coming now to the interior of the hall,

THE GENERAL SCHEME OF DECORATION

there is indicated by a vellum tone of background throughout. The panels of the ceiling are gilded solid, with stencilled Greek ornaments thereon, relieving bands of red and profuse ornamental work in gold and silver alternately. The three central ventilators, utilized as electroliers, are very handsomely ornamented in gold and turquoise blue, adding materially to the ornate appearance of the ceiling, which is brightness itself. The cornicing and entablature are relieved with blue paneling and red and blue bands, with ornamental work gilded solid. The side walls of the balcony are each divided into seven panels, divided by pilasters, and filled in with tripods on either side, festoons hanging therefrom, and a harp in the centre, each harp overhanging the name of a celebrated musician, author, artist, or sculptor. The dado offers a delicate contrast. It is divided into twelve panels, with a diaper pattern overall in three shades of ash-green, relieved with gold. The woodwork of the gallery is treated as teak. The front of the balcony is tastefully in keeping with the above, giving an ensemble to

THE WALL SCHEME,

which carries the eye upward with unbroken harmony. It is divided into small panels, filled in with solid gilding and Greek ornamental work, with lines of sienna and the fieldings filled in with blue. The lower part is painted with bands of ash-green and maroon, relieved with blue and gold and silver lines. All the capitals of the columns supporting the gallery are bronzed, while the columns themselves are treated as ironwork relieved with gold. The floors of the gallery underneath are divided into 24 panels relieved with red and blue lines; the cornicing is of old gold, vellum and red; and all the woodwork of the walls below is treated as teak. The chief feature of the entire scheme is the magnificent treatment of the large organ case. The two caryatides supporting the central entablature and the angel above are elaborately treated with gold and silver richly shaded. The pipes are alternately of gold, silver, and ivory,

WITH ORNAMENTAL VARIATIONS,

which place each in adequate relief. The panels and the upper cornicing are filled in gold and a red margin with stencilled ornamental work, while the lower panels are of blue and silver. The dancing figures in bas-relief on the supports of the main barrels are of a dainty ivory colour, relieved with a background of gold, while the columns, capitals, and enrichments are, like the centre pipes, treated with gold, silver, and ivory. The base of the instrument is over all of a red and green diaper pattern, and the organ case proper is painted to represent teak, in keeping with the rest of the woodwork. Next in importance, as a separate feature of the decorations, is the skilful treatment of the entablature over the rear balcony, supported by eight columns and four pilasters. The capitals of the pillars are gilded solid. The upper shafts are ivory coloured, and the lower ash-green, with red bands and gold and silver ornamental relief work. The bases are teak, and the mouldings thereof a rich bronze.

BLOXHAM. FROM A COLOURED DRAWING BY R. W. SAMPSON.

Correspondence.

THE R.I.B.A. AND THE GOVERNMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Mr. Woodward asks me to name the gentlemen who are not members of the Institute whom I consider to be the best men, and he will be very glad to break a lance with me on the matter.

I regret that I must decline this challenge, as it seems to me that such a proceeding would hardly be agreeable to the gentlemen concerned, and that the introduction of personalities tends to lower such a discussion to a vulgar wrangle over individual reputations.

It is not, either, as if I were alone in my opinion, and Mr. Woodward really needed information; there are at least three names that would occur to anyone.

I should be most happy, at any time, to discuss this or any other matter with Mr. Woodward, so long as the discussion can be kept on general lines, and personalities avoided.—Faithfully yours, A. R. JEMMETT.

Views and Reviews.

THE CROMER EXPRESS.

We have received a copy of a little brochure entitled "The Cromer Express," issued by the Great Eastern Railway Company. The work, which is very prettily got up and illustrated, details a journey from the Liverpool Street terminus to Cromer, starting at 1.30 p.m., and reaching the Norfolk watering place at 4.25. This run of 138 miles in 175 minutes may be reckoned as satisfactory travelling. Descriptions, enlivened with anecdotes, of various places of interest on the route are given, their distance from London and the time of passing being set down in the margin. The little views of Dedham Lock and Repp's Avenue, near Cromer, carry with them the conviction that there is scenery in East Anglia equal to any in other parts of England.

LESSONS FROM FIRE AND PANIC.*

It is eminently satisfactory that so much attention is now being given to the long-neglected subject of fire-prevention, and that an earnest effort is at last being made to benefit by the lessons of past fires and panics. The British Fire Prevention Committee has, in its infancy, accomplished much useful work, and it is very largely through its agency that this important question has of late been brought so prominently to the front. It can hardly be doubted that the Committee's programme of preventative measures, as revealed in the several publications already issued under its auspices, is based on the soundest principles, the propagation of which can be attended only by beneficial results. The latest publication of the Committee is a paper on "Lessons from Fire and Panic," by Thomas Blashill, superintending architect to the London County Council. An authority better worth listening to on such a subject we cannot readily recall, for the chief building official of the metropolis brings to bear a vast—perhaps unrivalled—experience with the matters of which he treats. The sense of security induced by the consciousness that the great question of fire prevention is stringently dealt with by a large administrative body like the London County Council—that Building Acts are in operation for our protection—is no doubt responsible for the prevailing belief that fire-risks are less to-day than they were a dozen years ago. Yet is it so? Buildings, especially commercial buildings, are getting more lofty, more closely crowded together, and more thickly inhabited. There is more machinery actuated by heat. The timber we use is more easily combustible, fittings are lighter, and everything is kept warmer and drier. In fact, most of our brick or stone and slate houses are nothing else than grates, in which their contents can be most conveniently burned.

Hence, it is evident that the construction and arrangement of modern buildings ought to be greatly improved. It is true that streets cannot be widened, and that unoccupied areas cannot be increased. But what can be done is to diminish the chances of fire and to delay its progress, to prevent its passage from room to room and from house to house, so to arrange the building that a fire may be more easily put out, and as regards the safety of the inmates, to provide the best means of escape. Mr. Blashill gives invaluable suggestions as to how these improvements can be effected. He suggests that openings in external walls where the streets or back areas are narrow should be provided with fire-resisting blinds. This would delay the passage of the fire from within and without. Floors should be made, as in Paris, fireproof, and roofs should be incombustible. As to partitions, lath and plaster should be quite abandoned, for a half-brick wall in cement is as easily constructed. Next he deals critically with old structures, and with the question of arrangement of buildings with the view of preventing loss of life from fire. By the Factory Act of 1891 every new factory in which more than forty persons are employed must be provided with means of escape in case of fire. The Factory Act of 1895 extends these provisions to certain workshops and laundries. Mr. Blashill enumerates the best kinds of fire-escapes for different cases, according to the circumstances, under these Acts. He also gives a lucid explanation of the new regulations of the L.C.C., and he justifies their stringency. In conclusion, he appeals to architects to feel that it is a moral duty for everyone charged with the erection or care of a building to make it as secure in case of fire and panic as he can.

* Lessons from Fire and Panic. A paper by Thomas Blashill, F.R.I.B.A., F.S.I., superintending architect to the London County Council. Edited by Edwin O. Sachs. Issued at the offices of the British Fire Prevention Committee, 1, Waterloo Place, Pall Mall, W. 1s.

CARLISLE CATHEDRAL.*

Carlisle Cathedral was at no time of the first importance, either for size or beauty. Burnt out in 1292, it suffered again from fire in 1392. Then it was partly destroyed in 1646, when the city surrendered to General Lesley, and in 1746 we find it used as a prison for captured Highlanders. A "restoration" carried out by Bishop Lyttleton seems to have completed the destruction. From this it will be seen that the chief interest of the building to-day is antiquarian, rather than artistic; and this is the point of view which the author of this handbook seems to have chosen. He tells us all there is to know of the settlement by the Romans, and of the life of the town till it was refounded by William II., and of the first ecclesiastical establishment under Henry I., and so on through the history of the various buildings, up to the present time. This account is clearly and pleasantly written, and is illustrated by numerous pen and ink sketches, which, however, are hardly up to the level of first-class contemporary work. However, they serve their purpose. The book is nicely got up; paper, printing, and binding are all that can be desired.

* Carlisle Cathedral. By The Worshipful R. S. Ferguson, F.S.A., Chancellor of Carlisle. Illustrated by Alexander Ansted. London: Isbister and Co. Ltd.

THE Old West Gate at Southampton has been restored, and is to be used as a museum.

MR. PERCY ADAMS has prepared plans for new infirmary buildings in connection with the Dorking Workhouse.

MESSRS. GREGORY BROS. are about to erect a few bungalow residences, from plans prepared in their own office, in the quaint old-world village of Anthony's, Woking.

THE new Palace Theatre, Plymouth, to which we have previously referred in these columns, was opened on Monday week. Messrs. J. T. Wimperis and Arber are the architects.

THE Bournemouth Town Council has adopted a resolution to make application to the Board of Trade for a provisional order to authorise the Council to supply electricity for any public or private purposes within the borough.

EFFINGHAM HOUSE,
Arundel Street, Strand,
London, W.C.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

September 14th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A CURIOUS circumstance lately brought to light in Paris is the inequality of the towers of Notre Dame. To the casual observer they appear equal, but there is a difference in the size of the bays. The explanation is curious. It seems that long ago the cathedral of a suffragan was not entitled to two towers of equal size, and for centuries Paris was suffragan to the Archbishop of Sens.

It may or may not be true that it was Rossetti who urged Burne-Jones, when at the outset of his career, to connect with a hyphen "Burne" and "Jones," says William Sharp in the September Atlantic. "'Jones' is nobody," Rossetti would declare, "only a particle of a vast multiple; but Burne-Jones—that is unmistakable!" It was an amusing trait in Rossetti that he was wont to designate the good work of this or that friend as the work of —, and he would mention the most distinctive name or part-name of the person concerned. Thus he would say, "Yes, that is Burne-Jones, but this, this here, you know, is only Jones"; or, "That, now, is the real Holman Hunt, but this here is only Hunt"; or, "You can hear Tennyson in that, but Alfred wrote the other lines."

MR. SHARP recalls two amusing instances where Burne-Jones more or less unconsciously adopted the same method. He was asked once if he thought William Bell Scott more eminent as a poet or as an artist. "I never thought very highly of Bell," he replied; then, seeing a look of surprise, added, with a humorous twinkle, "I like old Bell Scott—old Scotus, as we always called him—immensely, and I think William Bell Scott wrote some very fine verse, but I always thought it was a pity that Bell took to painting!" The other instance occurred when someone remarked to him that "Parnell was only an agitator." "Charles Stuart Parnell," he replied with emphasis, "was one of the greatest public men of our day, and far and away the ablest Irish leader."

THE largest statue in the world is Bartholdi's "Liberty Enlightening the World," at the entrance to New York harbour, presented by France to America in 1885. The cost of the statue was about £8000; its height from the base to the top of the torch held high above the head of the goddess is 151ft. The statue, standing on a pedestal 88ft. high, is made of repoussé copper, and is so large that forty persons can be accommodated in the head, while the torch, reached by a spiral staircase, will hold twelve.

THE munificence of Lord Grimthorpe in the restoration of St. Alban's Abbey has been one of the most memorable things in this age of church building and restoration. His interest in it has been maintained for many years, and has suffered no abatement, notwithstanding the varied opposition he has met with. The restoration has been conducted also on a princely scale. It is said that during the twenty years he has been at work on the fabric he has spent no less than £250,000.

THE home of John Keats at Hampstead is in imminent peril at the hands of the speculative builder. "Swiftly and surely," writes Mr. D. H. Parry, "a band of red brick is closing round the garden where the immortal 'Ode to a Nightingale' was penned on those loose sheets which were hidden behind the shelves of the bookcase. The 'melodious plot of beechen green' has vanished; the nightingales have long ago gone, but the house still stands, with its recently-affixed tablet, and it will be a lasting disgrace to every British man and woman of letters if it is allowed to fall. Charming in itself as it nestles retired from the road amid a pleasant stretch of velvet lawn, it is hallowed by the memories of the poet's unhappy passion, by his illness so soon to prove fatal, by the visits of some of his most distinguished contemporaries. It is a shrine which should be saved from the desecration with which it is threatened, but if anything is to be done it must be done at once, and if you, sir, through the medium of your columns, could set the ball rolling to a successful issue, it would be to earn the gratitude of all lovers of one of the youngest and one of the greatest poets in the English language."

M. FELICIEN ROPS, who died a few days ago, was a painter and etcher of a most extraordinary character. His canvases were the weirdest and most horrible productions in Art since the semi-insane dreams of Wiertz took form in the pictures now in Brussels. He was wild, ghoulish, Satanic. Somebody once, not untruly, called him "the explorer of dark feelings." In his long and industrious career he gave to the world some beautiful interiors and studies from Nature, which are far enough removed from the fantastic efforts which have come to be associated with his name. It is for the latter, no doubt, that he will be remembered—"Les Diaboliques," "Le Vice Suprême," "Curieux," and the amazing "Sataniques"—in which he has ranged through nearly every circle of the human Inferno.

No one has rendered so well as he has the hallucination of perverse passion. And, as usual, there was the most violent contrast between his Art and the conditions of his private life. He was a peaceful grower of roses on the hills of Essonne. For the last two years he gave up his Paris studio, and worked in the "Demi-Lune," a little lonely hermitage of a place cut out in the hillside on the site of a former quarry.

THE west front of the Llandaff Cathedral is by far the most beautiful feature of the sacred edifice, and it is now proposed to adorn it still further. The three central windows, as well as the gable window of the western façade, are about to be filled with stained glass of very beautiful character, from the designs of Mr. J. P. Seddon. The filling in of these windows with stained glass has been suggested upon more than one occasion as memorials to departed ecclesiastics at one time or other members of the Chapter.

It is many long years ago since any ornaments in the form of a cross, candlesticks, &c., adorned the altar of Llandaff Cathedral; in fact, the altar has been perfectly bare since the restoration of the ancient fane in the "fifties." There were certainly none in the Italian temple erected within the ruins in 1752, but there can be no doubt that they were there at some time or other. Llandaff has been in centuries past plundered so often that these ornaments, set as they were with precious

stones, formed valuable booty to the marauders. This century has brought about many marvellous changes in the cathedral, and it is now an open secret that it is intended to present to the cathedral a magnificent brass cross and pair of stately candlesticks designed by Mr. J. D. Seddon.

It seems that the builder is intruding along the Cornish coast, and the local correspondent is up in arms:—"Several big hotels and golf links are just now springing up in some of the grandest and loneliest spots of Mount's Bay, and the other day I noticed that the cliff path was cut right in two by some excavations attendant on building. Already the side of this footpath nearest the Lizard is overgrown with brambles, so as to be in danger of being lost to view. Suppose the rambler meanwhile gets into the way of following another path, we all know the kind of thing that is liable to happen. After a time, when the old cliff path is quite lost, the rambler who uses the temporary path will be told he is a trespasser—as he really is—and so vanishes an ancient right of way for ever."

"THESE are cases for the British public. Local feeling, owing to the scanty population in the wildest spots, is helpless, especially as the people of most local influence are generally amongst the speculators. Indeed, several recent appearances of railings, barbed wire, little enclosures, absence of whitewash on some of the cliff stones, and other signs, almost lead me to think that a day of general grab is not altogether unexpected on this coast. Now is the time for the local Parish Council to rise nobly to the occasion and put an extra coat of whitewash on every big stone that denotes a cliff path on this portion of the Cornish coast. We have nothing whatever against hotels and golf links, but this is, as all ramblers know, a case where a few 'stitches in time' may save no end of pother."

THE announcement that the old military barracks at Bethnal Green are to be sold is not received altogether favourably by the residents of the locality. The building is also known to a much wider public from the fact that they have visited its locality when looking up the few spots in Bethnal Green of historic interest. Dickens has thrown an interest over the neighbourhood, for Bill Sikes lived here; and here, too, Nancy spent her last terrible moments. It was close by that, if the Percy ballads be correct, there lived a personage of whom, after six hundred years, traditions still linger in the locality. After the battle of Evesham Henry de Montford, son of the slain Earl, was found lying among the dead sorely wounded. He was rescued by his lady-love, and they afterwards lived in secret at Bethnal Green. Pretty Bessie, their daughter, says in the ballad:

My father, shee said, is soon to be seene;
The seeley blind beggar of Bethnal Green,
That dayle sits begging for charitie,
He is the good father of pretty Bessie.

The turreted house in which they were supposed to have lived was pointed out until a few years ago. The Militia headquarters have now been removed to Woolwich.

A SCHEME is being arranged for the organisation in London of a Society of Pastel Painters, and a meeting to discuss the project is about to be held. Several well-known artists, among them Mr. G. F. Watts, Mr. Clausen, Mr. J. M. Swan, and Mr. Walter Crane, have allied themselves with the movement, and are giving it active support. That such a society would be an artistic success seems probable enough, but whether it would pay its way would depend very much upon the attitude of the public towards it. The medium which the association would exist to encourage is one of infinite possibilities, and gives results that are full of charm; but it would not seem, judging by the experience of another Pastel Society, which some years ago held exhibitions at the Grosvenor Gallery, to be greatly favoured by picture collectors. Things, however, may have improved since then.

THERE seems to be a vast amount of excitement in France over the arrangements just announced for housing works of Art in the 1900 Exhibition. Something like a strike is threatened by the Society of French Artists, who in solemn conclave have declared that they will not exhibit unless the building now being erected is altered in accordance with their views. The chief expression of dissatisfaction seems to be about the amount of space provided, which is asserted to be entirely inadequate; but complaint is also made that the rooms into which the Art gallery is to be divided are so small that large pictures cannot be properly shown in them. It will be interesting to see what will come of this ferment. That the artists are right in agitating for the fullest possible consideration of their claims is, of course, says the *Globe*, indisputable; but it is just possible that they take an exaggerated view of the position of affairs. They may, perhaps, change their minds, as they did once before when a similar outcry was raised concerning the selection of the *Palais des Machines* as a temporary home for the two Salons.

CERTAINLY the Government in providing space for nearly 3000 pictures would appear to have done all that is necessary. It is true that this space has to be divided into sections, one for foreign Art of all countries, another for French Art of the nineteenth century, and the third for works by living French masters; but even with these sub-divisions the total display will be quite considerable enough for the comfort of the average visitor to the show; and there will be no fear that really important canvases will have to be excluded for want of space. With more walls to fill the danger lest the jury of selection might descend from a high standard and accept works not entirely representative would always be present; and any lowering in the level of the exhibition as a whole would be matter for regret.

MESSRS. ROGERS, CHAPMAN, AND THOMAS commenced on Tuesday week the five days' sale of the contents of the residence of the late Mr. Edmund Coulthurst (for many years a partner in the firm of Coutts and Co.), Streatham Lodge, Lower Streatham. Good prices were realised. There were some important articles, chiefly objects of art and decorative furniture, in Wednesday's sale, the principal lot being a French walnut-wood and ormolu mounted and inlaid *marqueterie* *escri-toire* commode, with black marble top, the sides and front panels beautifully inlaid in flowers, festoons, and vases, the interior fitted with inlaid shelves and drawers, 4ft. high and 3ft. wide—295 guineas (Harding). This beautiful piece of furniture was in the Strawberry Hill collection of Horace Walpole, and is said to have been bought in at that sale for about £25, and to have come into the possession of the Coulthurst family by private purchase; until it left the Strawberry Hill collection the top was of porphyry marble, and this has been changed since for black marble.

THE more important of the other articles in the same portion were as follows:—A nearly new richly-coloured and bordered Turkey carpet, 22½ ft. by 14ft., and a Turkey rug *en suite*, £35 5s.; an elegant lac-japan and heavily embossed cabinet, ormolu mounted and brass bound, fitted with drawers, and on an elaborately-carved Indian rosewood stand, 26 guineas; a rosewood and ormolu mounted dwarf book-case, on carved plinth, fitted with shelves and enclosed by three glass doors—£26; a *bleu-de-roi* gilt Sèvres china bowl, cover, and stand, painted with birds—42 guineas; a Dresden china stand, surmounted by a clock, with figures, birds, and flowers in relief—£20; a pair of elegant Sèvres cabinet cups and saucers, *bleu-de-roi* richly gilt, and raised gilt panels, hand painted in medallions of Louis Philippe I., of the Grande Duchesse de Montpensier, on metal stands and under glass shades—60 guineas; this choice pair was presented to an uncle of the late owner, Mr. W. M. Coulthurst, by Louis Philippe himself,

and the purchaser was a nephew of the late Mr. E. Coulthurst. A *suite de cheminée*, comprising five Dresden vases with handles and covers, richly gilt and festooned, and painted in medallions of Greek Emperors, &c.—£14; a handsome Oriental china centre vase, with cover (which is slightly damaged), the whole massively mounted in ormolu—£40 8s.; a tortoiseshell and gold-mounted snuff box, with the lid beautifully painted in miniature of a lady reclining against draperies, and landscape with temple in the background, 22 guineas.

THE second day's sale included the library, which is chiefly remarkable for an original subscriber's copy of a complete series of the magnificent ornithological works of the late John Gould, F.R.S., 44 imperial folio volumes in all, with over 3100 coloured plates; this exceptionally fine set, catalogued in twelve lots, was sold *en bloc*, bidding commencing at 100 guineas, and the hammer falling at £430, the name of the purchaser not transpiring. This magnificent work does not appear to fully maintain its former price; in 1888 a well-known bookseller catalogued a set at £1000, in November last year the same firm offered a set at £650. The other books in the sale included "Engravings from the Works of Sir Joshua Reynolds," in three volumes, £50; and "Engravings from the Choicest Works of Sir Thomas Lawrence," by Henry Grave, £38. The pictures included "The Surrey Hunt," with figures of hounds and portrait of Daniel Haigh, the well-known master, on horseback, 50 guineas; T. Creswick, R.A., the original frontispiece to the *Sporting Magazine*, on panel, £18 18s.; a series of six portrait miniatures, five of ladies and one of a gentleman, 200 guineas; a beautifully painted miniature portrait of a lady, mounted in gold and set in gilt frame, £33; and a large portfolio containing a fine collection of 179 engravings after the old masters, including Raffaele, Reynolds, Rubens, Van Dyck, Watteau, Wouwerman, Titian, Landseer, etc., £46.

As the outcome of a coroner's enquiry last week it was ascertained that the death of a child was due to a movable coal box having been placed against the guard rail of a fifth-floor landing in some model lodging-houses. The result was to reduce the height of the guard from 4ft. to 18in., and the child having clambered on to the coal box, overbalanced, and was picked up dead. The superintendent of the buildings explained that had any danger been anticipated, the coal boxes could have been made fixtures on another part of the landing.

ACTON CHURCH, Nantwich, Cheshire, which is one of the most ancient churches in the country, has been re-opened by the Bishop of Chester, after being completely restored. The estimated cost of the alterations, the carrying out of which was entrusted to Mr. Austin, of Lancaster, was £2500, but the decayed condition of the fabric rendered further restoration necessary, and the total cost was increased to about £6500. The restoration embraced the removal of the wall of the north aisle and its re-erection exactly in the original style, the removal of the old debased brick-lined clerestories, and the substitution of handsome walls and windows; the erection of a fine oak and leaden roof, the strengthening of the tower, the erection of modern oak seats in place of the old-fashioned square pews, and a new pulpit. The work of restoring the chancel was undertaken by Lord Tolle-mache, the lay rector of Acton Church, at a cost of £1300, the work embracing the erection of an oak roof covered with stone flags, and the renewing of the interesting Jacobean woodwork which remained from a former restoration.

SOME important work being carried on at the Church of St. Giles, Cripplegate, has resulted in the discovery of a portion of what is probably the doorway of the original church, built in 1090 by one Alfune. At that time the whole district to the immediate north,

where Islington and Hackney now stand, was one dreary and impassable swamp. The present structure, which dates from 1892, is the third building on the site. Five years ago, at the renovation, the portion around the organ was left untouched, and it is in removing the instrument now from the north to the south aisle that the discovery of the ancient doorway has been made.

SUBURBAN theatres are especially in evidence in South London, where quite a number of places of amusement are now in course of erection. The first to be opened will be the Crown Theatre, High Street, Peckham, which will be ready for occupation in about five weeks. It will be capable of accommodating 3000 persons, and it is claimed that the stage will be the largest in the suburbs, being 141ft. long by 40ft. deep. Rapid progress is being made with the Kennington Theatre, and already the white stone walls form a prominent landmark. The opening is definitely fixed for Boxing Day. The Terriss Theatre, nearly opposite the Town Hall, Rotherhithe, and capable of seating 4000 persons, and the Royal Duchess Theatre, Balham, will both, it is hoped, be ready early in the spring.

A COLOSSAL granite monument is being made by an Aberdeen firm to the order of the Transvaal Government for erection at Pretoria as a national memorial of the repulse of the Jameson raid and a recognition of President Kruger's patriotism and valuable services to the Republic. Considerable reticence is observed with regard to the work, as the contractors, it seems, are bound under their agreement not to disclose particulars, but some details have become known. The monument is composed of red Peterhead granite, and is enclosed by a substructure of about 80ft. diameter. Access is obtained to the main structure by four broad flight of steps. The monument is octagonal in form, 36ft. across and the same in height, forming a solid mass of masonry, on the top of which, it is believed, a statue of the President will be placed.

WHEN the Marylebone Vestry erects its new town hall and municipal offices the old court house—one of the most ancient buildings in the borough—will be demolished. The court house and watch house were built as far back as 1729. They were rebuilt in 1804, but were soon found too small for carrying on the parish business conveniently, and a new court house, adjoining the old watch house, was built in 1825. Both these are still standing. The basement contains two cells in which prisoners were immured. They have the old thick oaken doors and barred windows.

IN these days of multitudinous memorials, it is strange that not one of the four greatest of our English poets has yet received the recognition of an adequate statue in London. Yet all of them were Londoners, either by birth or residence or intimate association. Chaucer, Milton, and Shakespeare are, indeed, placed all together round a fountain near Hyde Park. The fitting site of Charterhouse Square still lacks its monument to Spencer, who was educated at Merchant Taylors' School just opposite. It has been suggested that a statue of Milton should be placed in the churchyard of St. Giles, Cripplegate, within which the poet lies buried. It is perhaps not the best position that might have been selected; but both "Paradise Regained" and "Samson Agonistes" were written in Bunhill Row, and "Paradise Lost," though begun in York Street, Westminster, was mostly written in Jewin Street. Where Shakespeare's monument might well have been placed the statue of King William IV. is now, on the site of the Old Boar's Head Tavern, and within view of that spot across the Thames where the Globe Theatre once stood. A bust of Shakespeare was, it is true, recently placed in the churchyard of St. Mary, Aldermanbury; but that was more in honour of his first editors than of

himself. Is this comparative neglect owing to the fact that no sculptor is sufficiently daring to carve a likeness of the man who has left so little that is authentic (and that little contradictory) of his own personality, or are we merely as forgetful of our benefits as the Dublin Corporation?

THE Gloucester School Board recently had to adopt plans and select architects for certain proposed new schools. After the matter had been subjected to fair competition amongst the architects of the City, and the award of the adjudicator made known, the selection became a very simple one. So at least it appeared, for an award of this character ought not to be reversed without extremely good reasons. But the chairman of the Board had the temerity to suggest that another adjudicator *might* have arrived at a different conclusion; and this was neither just to the winner of the premium nor complimentary to the Board's good sense, which should require some substantial reasons to be adduced before reconsidering the judgment of the duly appointed and impartial adjudicator. The chairman appeared to lose sight of the interests involved, for it was the Board's duty to put aside all partiality for individual architects, and to base its decisions on considerations of efficiency and economy. The majority of the Board acted in this sense in sticking to the award, and appointing Mr. Dunn as architect of the new schools. It is a pity their action was challenged at all.

AN interesting link with the past is the old inn which is snugly enclosed between the two new entrances of the Metropolitan. In the year 1524 there existed in the pleasant little rural village of Padynton (afterwards Paddington), about a mile from Tyburn Gate, a celebrated village hostelry, yclept the "White Lion." Wayfarers and villagers, as well as merry-makers, made it their rendezvous; and here, to the accompaniment of pipe and tabor, the happy country folk would make holiday. To-day the "White Lion" still exists, but upon and around its site is built the Metropolitan Theatre of Varieties. It combines the present with the past.

MAY it be suggested that some attention should be given to the decorated ceilings in the façade of St. George's Hall, Liverpool, as those portions at the south end are in a dilapidated condition? The surprise is that this work was not included in the expenditure which recently took place on the embellishment of the interior of the building. Again, what is to be done with regard to improving the appearance of the fine allegorical group in the southern pediment of the hall? Some time ago it was resolved by the authorities that the sculpture should be thoroughly examined by experts; and as the first lot of panels erected on the front of the building have undergone a process which, it is stated, is durable, would it not be well to treat the pediment figures in a similar manner?

EVERY year sees London creeping further up the northern heights, and leaving in its trail rows of houses and macadam streets in place of the trees and greensward disturbed. Before long, says London, we may expect to see the extensive sweep of green around the Alexandra Palace blotted out by bricks. At various points building is proceeding apace, and now an extensive estate at Muswell Hill, which has kept one quarter green for years, has just come into the market to be let for building purposes. With the disposal of this estate it is possible that Tom Moore's cottage "Lalla Rookh" may be swept away. The cottage stands in its own grounds at the foot of the hill, not far from the Palace. Here Moore wrote a good part, if not all, of "Lalla Rookh." It is certain the poem was finished here, for Moore was living in the cottage in 1817, when Messrs. Longman paid him the unusual price of £7000 for the copyright. Most frequent among visitors to "Lalla Rookh" was Lord Byron, delighting as much in Moore's company as Moore (who "dearly loved a lord") delighted in his. In later years

Moore quitted Muswell Hill for Wiltshire, where he occupied a house adjoining Lord Lansdowne's park at Bowood until his death in 1852.

THE members of the Bradford Historical and Antiquarian Society have made their last excursion of the summer, visiting the town of Knaresborough. The party first visited the church, where the president read an account of some features of the history of the building. This statement the president supplemented with some interesting particulars of the visits of Cromwell to Knaresborough, and a defence of the part which he played in local history, the latter being called forth by some curious gossip about "the tyrant Cromwell," the alleged stabling of his horses in the church, and of his "orders" for the burning of the building, which the good lady who acts as custodian told with belated anti-Republican animosity. Subsequently the party gained the south bank of the river, and walked through the charming avenue called the Long Walk to the Dropping Well, afterwards returning to the Castle. A visit was also paid to the keep of the Castle.

THE archæological world is thrown into a state of great perturbation over the approaching visit of the Emperor of Germany to Jerusalem. It would seem that the Sultan, in his zeal to make things agreeable for his august guest, threatens to pull down the Jaffa Gate and a part of the ancient walls, so that the Kaiser may make his entry into the Holy City on horseback. The Jaffa Gate, although very ancient and picturesque, is exceedingly narrow, and quite inadequate—at least to the mind of the Sultan—for the occasion in question, although it did well enough for the State entries of Richard Cœur-de-Lion and Godfroi de Bouillon.

A BODY of about fifty workmen are busily engaged in repainting and renovating the iron work in St. Paul's Cathedral, and painting the railings, &c., in the churchyard. Every autumn parts of the Cathedral are overhauled, cleaned and painted, but this year the work is being done in a more thorough manner than is usually the case. The Dean and Chapter of the cathedral have decided this year to put a new face to the clock, and last week half-a-dozen skilled workmen took out the sections of frosted glass from the centre of the dial, and after removing the massive gilded hands, took out the interlaced rods of steel into which the glass had been fixed. A strong T-shaped scaffolding was fixed over the clock, and upon this the men worked. The work will cost a considerable sum of money.

A COLOSSAL amusement and convention hall is about to be erected at Chicago, rivalling the recently destroyed Coliseum in size and capacity. The building will be 600ft. by 348ft. The inside arena will be 472ft. by 260ft. This portion will be entirely free of pillars or obstructions to the view. The seating capacity will be 25,000. For convention purposes the arena can be furnished with chairs, making the total seating capacity of the planned structure 27,000. The height will be 100ft. The principal material to be used in the construction will be iron and steel. The exterior treatment will be Gothic.

QUITE a small display is made at the Manchester Corporation Gallery, where the total of works brought together is less than 250. One room is occupied by the pictures of the group of artists who hold the annual landscape exhibition in the Dudley Gallery, Messrs. J. S. Hill, E. A. Waterlow, A. D. Peppercorn, J. Aumonier, E. W. Allan, and Leslie Thomson; and with their contributions are shown a small series by the late T. Hope McLachlan. In the other rooms the chief exhibits are Mr. Coutts Michie's "Haytime in the Fens," Mr. A. C. Gow's "The Signal," Mr. G. H. Boughton's "When the Dead Leaves Fall," Mr. David Murray's "A Summer Day," Mr. W. L. Wyllie's "The Winding Medway," and Mr. E. A. Abbey's "Hamlet."

DURING the present recess the Bernini bust of Cromwell, which Mr. Wertheimer has presented to the Westminster Palace, is to be moved from the position it has temporarily occupied into a more suitable and appropriate place. Mr. Wertheimer, by way of making his gift as complete as possible, has expressed his intention of providing a pedestal which shall be thoroughly in keeping artistically with the bust itself; and this pedestal will probably be available by the time the transference is made.

THE splendid service of steamers run throughout the Highlands by Mr. David Macbrayne represents the apotheosis of comfort and sea convenience. These steamers cruise by some of the finest coast scenery in the kingdom, where colour, atmosphere, and contour can be studied and sketched in that perfect natural *ensemble*—the true background of all Art. By castles, with their towers and bastions, by the turrets and interesting roof-lines of the Scottish baronial homes, these steamers pass. One may enjoy a delightful excursion to the indigenous and purely natural Architecture of such caves as those of Staffa, where glossy pillars tower above, taking Gothic and Classic forms. Or, at Iona, one may trace the ground plan of one of the first Christian foundations in the kingdom. From the engineering achievements and experiments of the Clyde to the crofters' humble architecture and thatching, the whole gamut of Scottish Architecture is within hail or within vision of the artist's pencil. Nothing more delightful than a combination of sketch book and camera, with always the wonderful groundwork, in purple, blue, and grey, of the Scottish seas, can be imagined. Mr. David Macbrayne's steamers become the more popular with each year.

THE work of erecting a lofty tower on Brandon Hill, Bristol, in memory of the discovery in 1497 of North America by John Cabot and a crew of Bristol sailors, was commenced on June 24th, 1897. The work was only recently completed, and the opening ceremony took place a few days ago. The tower, which has been erected in the centre of the platform upon which the guns captured in the Crimean War stood, is a square structure of ornamental character. It has buttresses at the angles from base to summit. There are two stages, each of which is relieved with an ornamental balcony, which add much to the appearance of the tower. The floor of the upper balcony is 75ft. from the base, and above this there is an octagonal spire of 35ft., making the total height 105ft. The tower is ascended by means of a circular staircase of good width to the first stage, and above that there is a spiral staircase to the second stage. The style of the design furnished by Mr. W. V. Gough is typical of the style prevalent in England at the time of Henry VII. The spire of freestone is surmounted by a gilded figure mounted on a globe, also gilded. The platform on which the tower is erected is square, and is 42ft. across, and at the angles there are eapaultments occupied by the Russian trophy guns. From the top of the tower, which is 364ft. above sea-level, a magnificent panoramic view can be obtained of Bristol and neighbourhood. At the base of the structure there are panels for the reception of bas reliefs bearing inscriptions. Over the panel at the main entrance is the Bristol coat of arms, whilst on the east side is the Royal coat of arms of Henry VII. On the west side the panel is surmounted by the coat of arms of Venice. Brass plates have been affixed to the balustrades of the upper balcony indicating the direction and distances of various cities in England and abroad, and also pointing out the buildings of interest to be seen from the balcony. On the plates, too, are engravings of the buildings mentioned, and also an indication of the height of the balcony, viz., 334ft. above ordnance survey datum. Amongst the names of places on the plate on the west side is that of "Canada," which, it is stated, is about 2400 miles distant, and is the land first seen by Cabot, A.D. 1497.

BRITISH ASSOCIATION.

EXPERIMENTAL RESEARCH IN
ENGINEERING.

PREHISTORIC PEEPS.

THE BRITISH ASSOCIATION opened its annual meeting at Bristol last week.

Sir John Wolfe Barry presided over the section dealing with mechanical science, and in the latter part of his address referred to the recent and future demands for dock accommodation at Bristol and throughout the kingdom, and finally dealt with the necessity for experimental research as the basis of engineering science. On this latter head Sir John said:—

The anxieties of engineers have often been unnecessarily increased and public alarm gratuitously, though honestly, aroused. When the designs, of the Forth Bridge—of which the nation, and, indeed, the world, is proud—had been adopted both by the railway companies, who were to find the capital, and by Parliament, a most distinguished man of science—the then Astronomer Royal—came to the conclusion that the engineers had neglected certain laws which he enunciated respecting the resisting power of long struts to buckling, and that

THE BRIDGE OUGHT NOT TO BE CONSTRUCTED,

as he considered that, to use his own words, "we may reasonably expect the destruction of the Forth Bridge in a lighter gale than that which destroyed the Tay Bridge." All this was stated, no doubt from a strong view of public duty, in a letter to a public newspaper by Sir George Airy. If the bases of his calculations were right, the conclusion might have been correct; but the fact was, that there was no foundation worthy of the name for the reasoning. Another example of hasty generalisation occurs to me, and that is on the important question of wind pressure. Tredgold, who undoubtedly was one of the soundest of engineers, laid down in 1840 that a pressure of 40lb. per square foot should be provided for, reasoning, no doubt, from the fact that such a pressure had in this country been registered on a wind gauge of a square foot or less in area. As a consequence he assumed that the same force could be exerted by the wind on areas of any dimensions. Thus roofs and bridges, wherever any calculations of wind pressure were made, were designed for a pressure of 40lb. per square foot of the whole exposed surface, and under the alarm caused by the fall of the Tay Bridge in 1879, the piers of which were not probably strong enough to resist a horizontal pressure of one-fifth of such an amount,

A FURTHER GENERAL ASSUMPTION

was made, and railway bridges throughout the kingdom were ordered by the Board of Trade in 1880, acting no doubt on expert advice, to be in future designed, and are designed to this day, to resist 56lb. of horizontal wind pressure on the whole exposed area with the ordinary factors of safety for the materials employed, as if such horizontal strain were a working load. It had, for a long time previously to this order of Government being issued, been suspected that these small-gauge experiments were untrustworthy, and subsequent experiments at the Forth Bridge, on two wind gauges of 300 square feet and of 1½ square feet respectively, indicated that with an increase of area the unit of pressure fell off in a very marked degree. Under the same conditions of wind and exposure the larger gauge registered a pressure 38·7 per cent. less per square foot than the smaller gauge. I have been able to carry experiments further at the Tower Bridge by observing the pressure on the surface of the bascules of the bridge as evidenced by the power exerted by the actuating engines. In this case we have a wind gauge of some 5000ft. in area, and it has been shown that, while small anemometers placed on the fixed parts of the bridge adjoining the bascules register from 6lb. to 9lb. per square foot, the wind pressure on the bascules is only from 1lb. to 1½lb. per square foot. It

is difficult to imagine the amount of money which has been wasted in

UNNECESSARY PROVISION AGAINST WIND
STRAINS

of 56lb. per square foot on large areas in consequence of this hurried generalisation from insufficient data. I know something of what the provision for 56lb. on the square foot for wind cost at the Tower Bridge, and I do not wish to mention it; but if the public had been told that the dictum of experts, arrived at however hastily in 1880, was to be set aside in the construction of that bridge, all confidence would have been beforehand destroyed in it, and I suppose no committee of Parliament would have passed the Act. I have mentioned these matters, which could be added to by many similar instances in other branches of applied science, not for the sake of reviving old controversies, or of throwing a stone at highly distinguished men, honoured in their lifetime and honoured in their memory, nor for the sake of criticising more modern scientists or a Government department. Still less do I wish to question the necessity and value of mathematical calculations as applied to the daily work of engineering science, but I recall the circumstances for the purpose of bespeaking the utmost caution against our being tempted to lay down laws based on unascertained data. We know the tendency there has been at all times to generalise and to seek refuge in formulae, and we cannot but know that it is not at an end now. We ought to recognise and remember how few physical questions had been exhaustively examined sixty years ago, and may I say how comparatively few have even now been fundamentally dealt with by experiment under true scientific conditions? The investigation of physical facts under all the various conditions which confront an engineer requires much care, intelligence, time, and last, not least, not a little money. In urging the vital necessity of investigations, I am sure that I shall not be understood as decrying the value of the exact analysis of mathematics, but we must be quite sure that the premises are right before we set to work to reason upon them. We should, then, exert all our influence against rules or calculations based merely on hypothesis, and not be content with assumptions when facts can be ascertained, even if such ascertainment be laborious and costly. In connection with this subject, I may congratulate the association generally, and this section in particular, that there is now more hope for experimental science and some endowment of research in this country than at any former time. Last year a highly influential deputation waited on the Premier to urge that England should have

A PUBLIC PHYSICAL LABORATORY

at which facts could be arrived at, constants determined, and instruments standardised. The importance of the questions which could be determined at such an institution in their influence on the trade and prosperity of the country, independently of the advancement of purely scientific knowledge, cannot well be exaggerated. Our Government, while somewhat limiting the scope of the inquiry, appointed a small Committee to examine and report on this highly important subject. It is no breach of confidence to say that the Committee, after taking much evidence, visiting a similar and highly successful institution on the Continent, and studying the question in all its bearings, were convinced of the great public benefits which may be expected from such an institution, and have unanimously reported in favour of its establishment. I feel sure that we shall all earnestly hope that Government will carry out the views of the Committee, and I venture to suggest that each of us should use what influence he may have to induce the Chancellor of the Exchequer to find adequate funds for an institution which may be of the greatest benefit not merely to scientific research, but to the commerce of these islands, threatened as it is on all sides by foreign competition of the most vigorous description—a competition which is supported by every weapon which the science of other lands can forge for use in the struggle.

The first paper following the address was by Mr. R. C. H. Davison, who described the new works recently constructed at Barry Dock. He gave technical details of the manner in which the work of construction was carried out, an interesting feature being the method of dealing with the water which flowed in through fissures during the excavation. Among the features described in the paper were the deep-sea lock; the island railway, which connects Barry Station and the lock; a new graving dock, having a width of 60ft.; a similar double graving dock and a new single graving dock; and a new dock of 34 acres for coal export and for imports.—A paper by Messrs. W. J. Dibdin and George Thudicum on the conditions necessary for the successful treatment of sewage bacteria was next read. The authors, after giving certain historical details as to the origin of the modern theory that the natural destruction of waste organic material is effected solely through

THE AGENCY OF LIVING ORGANISMS,

proceeded to quote the conclusions arrived at by the State authorities of Massachusetts as a result of their experiments. The work done in America, although of importance from a theoretical point of view, failed to indicate the conditions necessary for practical working, and to discover these the London County Council instituted a series of experiments at Barking. The result was to demonstrate the practicability of purifying large quantities of sewage effluent on an area of filter which would make the adoption of the method possible from an economic point of view, and it was believed that crude sewage might be similarly treated. Reference having been made to the work of others in this direction, the authors proceeded to discuss the problem in detail, dividing the subject into seven different sections as follows: (1) Air supply, or its absence in the case of the septic tank; (2) temperature; (3) admission or exclusion of light; (4) reaction to test-paper of the sewage to be purified; (5) time of contact; (6) nature of bed material; (7) depth of bed. The conclusion of the authors was that the process was capable of being applied on a practical scale, although fuller experiments were needed to settle some details of actual working.

In the Anthropological Section, the Presidential Address was delivered by Mr. E. W. Brabrook, C.B., F.S.A. In the course of it he said:

Great as is the diversity of the anthropological sciences, their unity is still more remarkable. The student of man must study the whole man. No true knowledge of any human group, any more than of a human individual, is obtained by observation of physical characters alone. Modes of thought, language, arts and history must also be investigated. This simultaneous investigation involves in each case the same logical methods and processes. It will in general be attended with the same results. If it be true that the order of the universe is expressed in continuity, and not in cataclysm, we shall find the same slow but sure progress evident in each branch of the inquiry. We shall find that nothing is lost, that no race is absolutely destroyed, that everything that has been still exists in a modified form, and contributes some of its elements to that which is. We shall find that this, which no one doubts in regards to physical matters, is equally true of modes of thought. We may trace these to their germs in the small brain of the palæolithic flint-worker, or, if we care to do so, still farther back. This principle has, as I understand, been fully accepted in geology and biology, and throughout the domain of physical science—what should hinder its application to anthropology? It supplies a formula of universal validity, and cannot but add force and sublimity to our imagination of the wisdom of the Creator. It is little more than has been expressed in the familiar words of Tennyson: Yet I doubt not thro' the ages one increasing purpose runs, And the thoughts of men are widen'd with the process of the suns.

From the first moment that man recognised the advantage of using a club or a stone in attack or defence, the direct incentive to a

higher brain development came into existence. The man who first used a spear tipped with a sharp flint became possessed of an irresistible power. In his expeditions for hunting, fishing, gathering fruit, &c., primitive man's acquaintance with the mechanical powers of nature would be gradually extended; and thus, from this vantage point of the possession of a hand, language, thought, reasoning, abstract, ideas would gradually be acquired, and the functions of the hand and the brain be developed in a corresponding manner. I do injustice to Dr. Munro's masterly argument by stating it thus crudely and briefly. It amounts to this—once the erect position is obtained, the action of the man being controlled by a progressive brain, everything follows in due course. The next stage which we are yet able to mark with certainty is

THE PALEOLITHIC,

but there must have been a great many intermediate stages. Before man began to make any implements at all, there must have been a stage of more or less length, during which he used any stick or stone that came to his hands without attempting to fashion the one or the other. Before he acquired the art of fashioning so elaborate an implement as the ordinary palæolithic axe or hammer, there must have been other stages in which he would have been content with such an improvement on the natural block of flint as a single fracture would produce, and would proceed to two or three or more fractures by degrees. It must have been long before he could have acquired the eye for symmetry and the sense of design, of adaptation of means to end, which are expressed in the fashioning of a complete palæolithic implement. It is probable that such rude implements as he would construct in this interval would be in general hardly distinguishable from

FLINTS NATURALLY FRACTURED.

Hence the uncertainty that attaches to such discoveries of the kind as have hitherto been made public. Professor McKenny Hughes, who speaks with very high authority, concludes a masterly paper in the *Archæological Journal* with the statement that he has "never yet seen any evidence which would justify the inference that any implements older than palæolithic have yet been found." The name "palæolith," which had been suggested for prepalæolithic implements, seems to him unnecessary at present, as there is nothing to which it can be applied, and as it will be long before it can be asserted that we have discovered the very earliest traces of man, he thinks it will probably be long before the word is wanted. An elaborate work on the ruder forms of implement, just published by M. A. Thieullen, of Paris, who has for many years been engaged in collecting these objects, adds materially to our knowledge of the subject. The question is one of great interest, and I hope it will come up for discussion in the present meeting. Another line of argument bearing strongly in the same direction is afforded by the discovery in various places of works of

ART FABRICATED BY EARLY MAN.

The statuettes from Brassempouy, the sculptures representing animals from the Bruniquel, the well-known figure of the mammoth engraved on a piece of ivory from Périgord, and many other specimens of early art attest a facility that it is not possible to associate with the dawn of human intelligence. M. Salomon Reinach tells an amusing story. A statuette in steatite of a woman, resembling in some respects those of Brassempouy, was discovered in one of the caverns of Mentone as far back as 1884, but when the discoverer showed it to a personage in the locality, that authority advised him not to let it be seen lest it should take away from the belief in the antiquity of the caves, it being then thought too artistic to be consistent with early man. The finder acted on this advice, in ignorance of the real interest of the statuette, until April, 1896, when he showed it to M. Reinach and M. Villenois, who promptly interviewed the sage adviser in question, and obtained a confirmation of the statement. Some interesting

additions to our gallery of Prehistoric Art have been recently made by M. Emile Rivière and M. Berthoumeyrou at Cro-Magnon, in the Dordogne. These are a drawing of a bison and another of a human female in profile. Among the other objects found in the same place were

SOME FLINT IMPLEMENTS

brought to a fine point, suitable for engraving on bone or horn. The idea of making in any form a graphic representation of anything seen has never, so far as I know, occurred to any lower animal, and it could hardly have been among the first ideas formed in the gradually developing human brain. When that idea is found carried out with remarkable artistic skill by means of implements well adapted for the purpose, we may surely assume that the result was not obtained till after a long interval of time, and was approached by gradual steps marked by progress in other faculties, as well as in the artistic faculty. It may be that some day all uncertainty on this head will be removed by decisive discoveries. The interval between the palæolithic and neolithic periods rests in the like condition of incertitude. That by some means, and somewhere on the face of the globe, the one period gradually passed into the other we cannot but believe. That the transition between them may have involved innumerable degrees is also highly probable. Where and when and how each step was taken we do not know at present, and possibly never shall know. The problem is not satisfactorily solved by the production of palæolithic implements resembling neolithic forms, or

NEOLITHIC IMPLEMENTS RESEMBLING PALEOLITHIC FORMS,

inasmuch as between the one period and the other an interval of time involving geological and other changes has to be accounted for. In this respect, also, our best authorities are the most cautious and conservative. In the excellent address which Professor Boyd Dawkins delivered to the Royal Archæological Institute at the Dorchester meeting last year on the present phase of prehistoric archæology, he contrasted the few primitive arts, such as sewing and the manufacture of personal ornaments and rude implements of the chase, possessed by the palæolithic hunters, apart from their great proficiency in the delineation of animals—with the variety of arts, such as husbandry, gardening, spinning, weaving, carpentry, boat-building, mining and pottery-making, possessed by the neolithic herdsmen, and held that between the two there is a great gulf fixed. Somewhere that gulf must be bridged over. Professor Boyd Dawkins says that the bridge is not to be found in the caverns of the South of France. It is difficult to meet his argument that the presence of grains of barley and stones of the cultivated plum at Mas d'Azil are evidences of neolithic civilisation. His objections to other discoveries are not so strong as this, but are strong enough

TO MAKE US PAUSE.

The tall, long-headed people, whose remains were found at Cro Magnon, he holds to be early neolithic and not palæolithic, to stand on the near side and not on the far side of the great gulf. These considerations lend importance to the discoveries which have been laid before this association at previous meetings by Mr. Seton-Kerr, and which have also been commented upon by Professor Flinders Petrie and Sir John Evans. If we are compelled to admit a breach of continuity in Europe, is it in Africa that we shall find the missing links? That is another of the great problems yet unsolved, upon which I hope the discussions at the present meeting may throw some light. The evidence we want relates to events which took place at so great a distance of time that we may well wait patiently for it, assured that somewhere or other these missing links in the chain of continuity must have existed and probably are still to be found. The next stage, which comprises the interval between the neolithic and the historic periods, was so ably dealt with by Mr. Arthur J. Evans in his address to this section at the Liverpool meeting that it does not call for any observa-

tions from me. Two committees appointed by the Association in connection with this section touch upon this interval, the committee for investigating

THE LAKE DWELLING AT GLASTONBURY

and the committee for co-operating with the explorers of Silchester in their well-conducted and fruitful investigation of the influence of Roman civilisation on a poor provincial population. I pass on to consider the very great progress that has been made of late years in some of the branches of anthropology other than physical and prehistoric, and especially in that of folk-lore. I do this the more readily because I do not recollect that folk-lore has ever before been prominently referred to in an address to this section. It is beginning to assert itself here, and will in time acquire the conspicuous position to which it is becoming entitled, for the British Association is sensitive to every scientific movement, and responds readily to the demands of a novel investigation. Already, for three or four years, a day has been given at our meetings to folk-lore papers; and at the Liverpool meeting an exceedingly philosophical, and at the same time practical, paper was read by Mr. Gomme, and is printed *in extenso* in the proceedings as an appendix to the report of the ethnographic survey committee.

THE TERM "FOLK-LORE"

Itself is not without a certain charm. It is refreshing to find a science described by two English syllables instead of by some compound Greek word. The late Mr. W. J. Thoms had a happy inspiration when he invented the name. It is just twenty years since the Folk-lore Society was established under his direction. It has accumulated a vast amount of material and published a considerable literature; it is now rightly passing from the stage of collection to that of systematisation, and the works of Mr. J. G. Frazer, Mr. E. Sidney Hartland, and others are pointing the way towards researches of the most absorbing interest and the greatest practical importance. A generalisation for which we are fast accumulating material in folk-lore is that of the tendency of mankind to develop the like fancies and ideas at the like stage of intellectual infancy. This is akin to the generalisation that the stages of the life of an individual man present a marked analogy to the corresponding stages in the history of mankind at large, and to the generalisation that existing savage races present in their intellectual development a marked analogy to the condition of the earlier races of mankind. The fancies and ideas of the child resemble closely the fancies and ideas of the savage, and the

FANCIES AND IDEAS OF PRIMITIVE MAN.

An extensive study of children's games, which had been entered into and pursued by Mrs. Gomme, has been rewarded by the discovery of many facts bearing upon these views. A great number of these games consist of dramatic representations of marriage by capture and marriage by purchase—the idea of exogamy is distinctly embodied in them. You will see a body of children separate themselves into two hostile tribes, establish a boundary line between them, demand the one from the other a selected maiden, and then engage in conflict to determine whether the aggressors can carry her across the boundary or the defenders retain her within it. There can be little doubt that these games go back to a high antiquity, and there is much probability that they are founded upon customs actually existing, or just passing away at the time they were first played. Games of this kind pass down with little change from age to age. Each successive generation of childhood is short; the child who this year is a novice in a game becomes next year a proficient, and the year after an expert, capable of teaching others, and

PROUD OF THE ABILITY

to do so. Even the adult recollects the games of childhood and watches over the purity of the tradition. The child is ever a strong conservative. Upon the same principle, next to children's games children's stories claim our attention. Miss Roalfe Cox has collected, abstracted, and tabulated not fewer than 345

variants of Cinderella, Catskin and Cap o' Rushes. These come from all four quarters of the globe, and some of them are recorded as early as the middle of the sixteenth century. These elaborate stories are still being handed down from generation to generation of children, as they have been for countless generations in the past. Full of detail as they are, they may be reduced to a few primitive ideas. If we view them in their wealth of detail, we shall deem it impossible that they could have been disseminated over the world as they are otherwise than by actual contact of the several peoples with each other. If we view them

IN THEIR SIMPLICITY OF IDEA

we shall be more disposed to think that the mind of man naturally produces the same result in the like circumstances, and that it is not necessary to postulate any communication between the peoples to account for the identity. It does not surprise us that the same complicated physical operations should be performed by far distant peoples without any communication with each other; why should it be more surprising that mental operations not nearly so complex should be produced in the same order by different peoples without any such communication? Where communication is proved or probable it may be accepted as a sufficient explanation; where it is not probable there is no need that we should assume its existence. The simple ideas which are traceable in so many places and so far back are largely in relation with that branch of mythology which personifies the operations of nature. Far be it from me to attempt to define the particular phase of it which is embodied in the figure of Cinderella as she sits among the ashes by the hearth, or to join in the chase after the solar myth in popular tradition. The form of legend which represents some of the forces of nature under the image of a real or fictitious hero capable of working wonders appears to be widely distributed. Lord Bacon, who says "The earliest antiquity lies buried

IN SILENCE AND OBLIVION.

This silence was succeeded by poetical fables, and these at length by the writings we now enjoy, so that the concealed and secret learning of the ancients seems separated from the history and knowledge of the following ages by a veil or partition-wall of fables interposing between the things that are lost and those that remain," has shown in his "Wisdom of the Ancients" that classical mythology was in truth a vast system of nature-worship, and in so doing has done more than even he knew, for he has affiliated it to those ideas which have been so commonly formed among rude and primitive peoples. It is true, he says, fables in general are composed of ductile matter that may be drawn into great variety by a witty talent or an inventive genius, and be delivered of plausible meanings which they never contained. But the argument of most weight with him, he continues, "is that many of these fables by no means appear to have been invented by the persons who relate and divulge them, whether Homer, Hesiod, or others; but whoever attentively considers the thing will find that these fables are delivered down and related by those writers, not as matters then first invented and proposed, but as things received and

EMBRACED IN EARLIER AGES.

The relations drew from the common stock of ancient tradition and varied but in point of embellishment, which is their own. This principally raises my esteem of these fables, which I receive, not as the product of the age or invention of the poets, but as sacred relics, gentle whispers and the breath of better times, that from the traditions of more ancient nations came at length into the flutes and trumpets of the Greeks." Except that he supposes them to be a relic of better times, the poet's dream of a golden age, no doubt still ringing in his ears, Bacon had in this as in many other matters a clear insight into the meaning of things. To return. If continuity be the key that unlocks the receptacle where lie the secrets of man's history—physical, industrial, mental, and moral; if in

each of these respects the like processes are going on, it follows, as I have already said, that the only satisfactory study of man is

A STUDY OF THE WHOLE MAN.

It is for this reason that I ask you to take especial interest in the proceedings of one of the committees of this section, which has adopted such a comprehensive study as the guiding principle of its work. I mean the ethnographical survey committee. I have so often addressed this section and the Conference of Corresponding Societies on the matter since the committee was first appointed at the Edinburgh meeting, on the suggestion of my friend Professor Haddon, that I can hardly now refer to it without repeating what has been already said, or forestalling what will be said when its report is presented to you, but its programme so fully realises that which has been in my mind in all that I have endeavoured to say, that I must make one more effort to enlist your active interest in its work. The scheme of the committee includes the simultaneous recording in various districts of the physical characters, by measurement and by photography, the current traditions and beliefs, the peculiarities of dialect, the monuments and other

REMAINS OF ANCIENT CULTURE,

and the external history of the people. The places in the United Kingdom where this can be done with advantage are such only as have remained unaffected by the great movements of population that have occurred, especially of late years. It might have been thought that such places would be very few; but the preliminary inquiries of the committee resulted in the formation of a list of between 300 and 400. So far, therefore, as the testimony of the very competent persons whose advice was sought by them is to be relied on, it is evident that there is ample scope for their work. At the same time, the process of migration from country to town is going on so rapidly that every year diminishes the number of such places. One thinks with regret how much easier the work would have been one or two or three generations ago; but that consideration should only induce us to put it off no longer. The work done by the lamented Dr. Walter Gregor for this committee in Dumfriesshire and other parts of Scotland is an excellent type of the way in which such work should be done. His collections of physical measurements and of folk-lore have been published in the fourth and fifth reports of the committee. There can be no doubt that few men possess the faculty he had of drawing forth the confidence of the villagers and getting them to tell him their superstitions and their old customs. He succeeded in recording from their lips not fewer than 733 items of folk-lore. They not merely form exceedingly pleasant reading, such as is perhaps not often met with in a British Association report, but they also will be found to throw considerable light on the views which I have ventured to lay before you. It is much to be wished that others who have the like faculty, if even in a lesser degree, could be induced to take up similar work in other districts, now that Dr. Gregor has so well shown the way in which it ought to be done.

THE Autumn Exhibition at the Walker Gallery, Liverpool, opened last week. It includes over 1500 works, many of which are of great importance, and by artists of the first rank. Among the more notable canvases are Mr. T. Austen-Brown's "Benediction of the Sea," Mr. F. Bramley's "Dalesman's Clipping," Mr. E. A. Waterlow's "Lonely Church," Mr. Solomon J. Solomon's great Jubilee picture, Mr. Byam Shaw's "Truth," Miss Kemp Welch's "To Arms," Mr. G. C. Haité's "Bit of Old Chelsea," Sir J. D. Linton's "Roses," Mr. H. J. Draper's "Lament for Icarus," Mr. J. R. Weguelin's "Piper and the Nymphs," Professor Herkomer's "The Guards' Cheer," Mr. David Murray's "Old Shoreham," Mr. G. H. Boughton's "The Road to Camelot," "The Happy Valley," by Mr. William Scott, of Oldham; Mr. F. M. Skipworth's "Signal of Death," and "Perseus," by the late Sir Edward Burne-Jones.

A. A.

LIST OF PRIZE AWARDS.

THE prize list for Session 1897-98 of the Architectural Association is given in the current number of A.A. Notes. The list is appended:

A.A. Travelling Studentship, value £25, and Bronze Medal	H. F. Waring.
Second Prize	Not awarded.
A.A. Medal (Silver Medal and £5 5s.)	F. Dare Clapham.
Second Prize, value £5 5s.	T. Tyrwhitt.
Essay Prize, value £10 10s. and Silver Medal	F. N. Reckitt.
Measured Drawings Prize, value £5 5s.	A. M. Torrance.
Hon. Mention	J. G. N. Clift.
Andrew Oliver Prize, value £5 5s.	A. J. Roddis.
Arthur Cates Scholarship, value £10 10s.	T. Bee.
Discussion Section Prize... Architectural Union Company's Prize	Not awarded.

LECTURES.

DIVISION I.

Silver Medal and A.A. Scholarship, value £6 6s.	S. H. Goodwin.
Bronze Medal	H. S. Barrett.
Hon. Mention	S. Wheeler.

DIVISION II.

Silver Medal	T. G. Lucas.
Bronze Medal	W. M. Settle.
Hon. Mention	H. T. Bromley.

STUDIO.

DIVISION I.

Silver Medal and Certificate	Not awarded.
Bronze Medal	C. H. F. Comyn.

DIVISION II.

Silver Medal and Certificate	C. E. New.
Bronze Medal and Certificate	J. G. N. Clift.

ORDER OF MERIT.

DIVISION I.

GREEK AND ROMAN ORDERS.—S. H. Goodwin, Certificate and Book; C. L. Fleming-Williams, B. J. McAdam.

ELEMENTARY CONSTRUCTION.—S. H. Goodwin, Certificate and Book; H. S. Barrett, A. R. Conder.

ENGLISH ARCHITECTURE.—S. H. Goodwin, Certificate and Book; H. S. Barrett, C. L. Fleming-Williams.

ELEMENTARY PHYSICS, FORMULÆ, AND CALCULATIONS.—S. H. Goodwin, W. J. Davies, Certificate and Book; P. B. Dannatt, S. Wheeler.

PLANE AND SOLID GEOMETRY.—S. H. Goodwin, Certificate and Book; A. R. Conder, H. S. Barrett.

MENSURATION, LAND SURVEYING, AND LEVELLING.—S. H. Goodwin, certificate and book; P. B. Dannatt, C. Bré.

DIVISION II.

CONSTRUCTION.—T. G. Lucas, certificate and book; W. M. Settle, L. I. Wood.

MATERIALS.—T. G. Lucas, certificate and book; R. T. Miller, W. M. Settle.

STRESSES AND STRAINS.—H. T. Bromley, W. H. Collin, certificates; G. H. Smith, T. G. Lucas.

DRAINAGE AND WATER SUPPLY.—T. G. Lucas, certificate; W. H. Collin.

VENTILATION, LIGHTING, AND HEATING.—R. T. Miller, certificate; T. G. Lucas, J. H. A. Phillips.

SPECIFICATIONS AND ESTIMATES.—J. Ormrod, certificate; M. G. Pechell, F. J. O. Smith.

ELEMENTARY CLASS OF DESIGN.—Silver Medal, Certificate, and Scholarship, value £5 5s., A. H. Goslett; Bronze Medal and Certificate, R. H. Butterworth; Hon. Mention, G. Bailey, F. J. Corfield.

ADVANCED CLASS OF DESIGN.—Silver Medal, Certificate, and Scholarship, value £5 5s., C. L. Brierley; Bronze Medal and Certificate, F. N. Reckitt.

Professional Items.

ABERDEEN.—The restoration of St. Mary's Chapel, East Parish Church, Aberdeen, is now nearing completion. The stone flooring in the north transept and nave is now finished, and the last of the mason work connected with the restoration is in progress—the renovation of the apse windows, and the placing in position in the north transept of the granite fountain gifted some time ago. The joiners are now at work laying the diagonal oak flooring in the south transept. The total cost of repairing the chapel is £654.

BEESTON.—It has been decided to enlarge the Beeston Primitive Methodist Chapel, and the work is being carried out from designs by Messrs. Howdill and Howdill, architects, Albion Street, Leeds. The front is being brought forward to the Town Street, and the additional space will give accommodation for 79 persons. The front will be wholly of brick, and will be a simple treatment of the seventeenth-century English Renaissance style of Architecture. The school, two class-rooms, heating chamber, &c., are being added at the back of the chapel. By an arrangement of screens the whole of the premises can be thrown into one assembly room in the form of a Greek cross.

BIRMINGHAM.—A handsome wrought-iron and brass chancel screen has been presented to Handsworth Parish Church, Birmingham, which the Bishop of Lichfield has just formally dedicated. The rood-screen is a fine example of artistic metal-work, from the design of Mr. Chatwin, the architect of the modern portion of the church. The framework is of iron, with gilt decorations, and the figures usually associated with a rood-screen are gilt. There are further introduced some copper embellishments. The makers are Messrs. Thomason and Co., Birmingham.

DEVONPORT.—The clock and chimes placed in the tower of the Municipal Technical Schools, Devonport, have just been presented to the town. The clock tower, which is an addition to the original design of the building, rises to 120ft. above ground level, and its well-proportioned and graceful outline adds materially to the imposing façade of the building. The dials of the clock are 7ft. 6in. in diameter, and the time of day can be distinctly seen for a long distance in all directions. The hour bell weighs one ton, and the four quarter bells range from half a ton downward. The bells are hung in the thickness of the walls, and are visible from the outside, similar to those in church towers at Barnstaple and Northtawton, which are the only instances in Devonshire of bells being hung in this manner. By an automatic arrangement the chimes will be cut off each night from 10 p.m. until 6 a.m.

EDINBURGH.—The day Industrial School, St. John's Hill, the latest addition to the schools under the charge of the Edinburgh School Board, is now in use. The school has been built from designs by Mr. Wilson, architect, Queen Street. Its architectural features are Scottish, dormer windows and crow-stepped gables giving character to it. Its corridors and class-rooms have been lined throughout with red brick with an enamelled face, the floors and doors are pitch pine, and the rooms are all well lighted and well ventilated. On the street floor, on the right of the boys' entrance, there are waiting rooms and bath rooms where they get their first wash. This is duplicated at the east end of the school for girls. The main portion of the ground floor is made into a recreation hall, screened off in the centre into two portions, one for boys and another for girls. This opens upon a swimming or large plunge bath on the south side of the school, which will be used at separate times by the boys and girls. Outside, on the south side, are open concreted courts surrounded by a high wall, forming playgrounds for the children. The class rooms and indus-

trial rooms are on the first and second floors, and on the girls' side are the kitchen, wash-house, and laundry.

HALKYN (Flintshire).—The Duke of Westminster has just given instructions for the alteration and enlargement of the National Schools at Halkyn, Flintshire, at an estimated cost of upwards of £1000. At present the buildings are in the shape of a T, but when the projected additions are completed they will form a square, and provide accommodation for a considerable increased number of children. The Duke is also erecting a complete set of new buildings at Rhesycae—another village on his estate—to replace the present buildings, which are antiquated, dilapidated, and inconvenient. The contractor for both schools is Mr. A. B. Lloyd, builder, Flint, and the architects are Messrs. Douglas and Minshull, Abbey Square, Chester.

HAWARDEN.—The foundation stone laying in connection with the new church at Shotton, near Hawarden, is arranged to take place to-day (the 14th inst.) Messrs. Douglas and Minshull, Chester, are the architects, and Messrs. Isaac Ward and Sons, Uttoxeter, the contractors. The cost is estimated at £4700, which, with other expenses, besides the site, will bring the total amount up to about £5500. The church, which, when completed, will consist of a nave, north and south aisles, chancel, and sacarium terminating in an apse, will be erected in Early English style, the windows being mainly of lancet pattern. Red and white Hollington stone in random courses will be used in construction, and the roof will be covered with pale green Westmoreland slating.

LEEDS.—The new depôt of the Sanitary Department of the Leeds Corporation, which is situated in Dock Street, was opened a few days ago. The building is intended for the stabling of the Corporation horses and sanitary appliances. The site is one of the most convenient that could be chosen. It is bounded on the south by Bowman Lane, on the west by Kendell Street, and on the north by the river Aire. The frontage to the river is 250ft., of which 210ft. is available for unloading boats, &c. The total area is 11,257 square yards, which was purchased by the Corporation for 25s. per yard, and 1000 square yards has been given up for the widening of Bowman Lane and Kendell Street. The stable accommodation is eight blocks, twenty houses in each block, making a total accommodation for 160 horses, whilst there are four loose boxes and five isolation boxes. The eight blocks of stables constitute four separate buildings, separated from each other on the two sides by paved yards 40ft. in width, and at one end of the yard 30ft. in width. Adequate arrangements have been made for the management of the depôt, offices for officials and shops for workmen having been constructed on commodious lines. The building has been completed by ten different firms of contractors, and is in every way adapted for the purposes for which it is required.

LIVERPOOL.—At the last monthly meeting of the Liverpool Library, Museum and Arts Committee, Sir William Forwood in the chair, it was stated that Mr. C. Dyall, curator of the Walker Art Gallery, had prepared a scheme for the extension of the buildings. The City Surveyor said Mr. Dyall's plan, which proposed additions to the rear of the existing gallery, was an admirable one; it would nearly double the size of the building, and would cost £29,000.—The Chairman remarked that, while Mr. Dyall's scheme was very complete and perfect, it was too ambitious for the committee to undertake at the present time. The committee felt the necessity for an extension, but their idea was to construct a building which would cost some £8000 independently of the site.—The Surveyor pointed out that the existing gallery covered an area of 16,000 square feet, Mr. Dyall's proposed addition would cover an area of 14,000 square feet.—After some conversation, the surveyor was instructed to submit next

month plans of an extension to cost £8000, but so designed as to allow of further additions in the future.

LONDON, S.W.—A new music-hall is to be opened in London in a few days. Its name is the Granville Theatre of Varieties, and it is situated on the north side of the Broadway, Walham Green. Mr. Frank Matcham is the architect. The elevation is imposing; it is built of red brick and terra-cotta, the corner being very artistically treated with towers and minarets. Over the entrances will be handsome iron and glass shelters, filled with painted glass and brilliantly lighted. The entrances and vestibules are beautifully decorated with raised plaster enriched, the ceilings and walls being panelled out in Louis XVI. ornamentation; this decoration is carried along the walls of the open corridor at sides of stalls, and is finished in blue and gold, with figure paintings in panels, the whole having a most charming effect. The greatest novelty in the building is its decorations. Mr. Matcham has introduced Eburite faience ware for the whole of the interior embellishments; not only are the walls covered with this material, but also the proscenium front, auditorium, ceiling, gallery, and balcony fronts, which give a most charming result. It will save a great deal of labour and expense that otherwise would be necessary for the renewal of decorations and keeping clean, as by giving it a rub down periodically with a wet sponge it is always kept bright and clean. The Eburite faience is a special egg-shell glazed material which has been successfully used in other large schemes of decoration by Mr. Alfred Whitehead, of Leeds, the contractor for this work, who has now combined business with the Campbell Tile Co., and who are now carrying it on as "Campbell, Whitehead, and Co., of Leeds, and Stoke-on-Trent." The design and modelling of the work has received great attention, and when the whole decorations are brilliantly illuminated with the electric light, and warmed with the rich copper colour draperies and velvet seats, a beautiful effect will be obtained. The following are the names of the principal firms engaged in the construction and fitting up of the building:—Contractors for foundations, Mr. Charles Wall, Chelsea; contractor for superstructure, Mr. C. Gray Hill, Coventry; electric lighting, Messrs. Lang, Wharton, and Down, London; gas fittings, Messrs. James Stott and Co., London; plumbing, Messrs. Finch and Co., Limited, London; hot water heating, Messrs. Oldroyd and Co., Leeds; hydrants, Messrs. Shand Mason and Co., London; faience work, Alfred Whitehead, Leeds; plastic work and painting, Messrs. F. de Jong and Co., London; upholstery, Messrs. H. Lazarus and Son, London.

MEXBOROUGH.—A building in High Street, Mexborough, which was originally used as a Nonconformist chapel, and subsequently as a mission church, has been acquired for club premises. The sum of £500 has been expended in making the necessary alterations in the building, and in providing a billiard room, reading room, smoking room, card room, a large apartment that can be utilised for general meetings, together with all the other conveniences which go to make a really comfortable and up to date institution of this kind. Mr. G. White is the architect, and Mr. W. Shepherd the contractor. The decorating has been done by Mr. Walter Nicholson.

MONIFIETH.—A new hotel is to be erected on the Links at Monifieth. The building will be of handsome design. It will be erected on the south side of a new street to be formed in front of the Panmure Golf Clubhouse, and will consist of two stories. The architects are Messrs. Johnston and Baxter, Dundee.

WICK.—The Carnegie Free Library was opened last week. The buildings are situated on a site at Pulteneytown, and are built from plans by Messrs. Leadbetter and Fairley, architects, Edinburgh. The cost, apart from the site, valued at £500, will be over £4000.

Enquiry Department.

DEFECTIVE WORK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—(1) A contractor undertakes to supply an article according to specification. When completed the architect inspects the same, and verbally approves of it. Afterwards he finds that certain materials are not as specified. Can he then compel the contractor to replace the defective materials? (2) If the architect had approved of the article in writing, has he power to do the same thing?—Yours, &c.,

F. A. S.

We believe that, strictly speaking, the architect cannot compel the contractor to replace defective materials of which he has once approved, whether the approval should have been in writing or verbally, but that he would be responsible to his client for having passed that which was faulty. On the other hand, no respectable builder would refuse, under such circumstances, to reinstate what was admittedly faulty, and if he did refuse, the architect would be, morally at least, fully justified in withholding his certificate until he complied.

LABORATORY FITTINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be much obliged if you can furnish me with particulars of the fittings necessary for physical and chemical laboratories. Is there any book published illustrating the same?—Yours, &c.,

J. F.

Your best plan would be to apply to one of the many firms of laboratory outfitters, who could supply you with all particulars. We could send you the names of two firms upon the receipt of your full address. We know of no book upon the subject.

ROUGH CAST COLOURING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—H. M. C. writes for information re above. I have similar work to do myself, but wouldn't it be better floated flat? Rough cast naturally gathers dirt, whereas if smooth the dirt will wash off with heavy rains. I also wish to colour the cement yellow; will it be necessary to colour the whole or only the top fine finish, and will it take a great amount of ochre to colour? On plaster work I have used calcarium, and find that the first shower of rain spoils the whole affair, washing all the colour out of it, and I propose painting same next time as the only remedy. Can I do anything better? Having some stables to build, I should like to colour the cement in the gangways red; how can I do this, and would it add greatly to the expense? For any information as to this and the stucco work I shall be grateful.—Yours, &c.,

J. C. K.

Of course, the surface of the plaster may be finished flat if desired, but it will not then be "rough cast," and its appearance, in connection with half-timbered work, will not be so effective as is that of the latter. It is not absolutely necessary to colour the whole body of the plaster, but unless a great deal of it has to be done, not much will be gained in point of economy by colouring one portion only, as the stainer would cost less than the double labour of mixing and serving from two boards. For stucco finish, however, the plan may be adopted, as a fine coat must be prepared, and this alone needs colouring. It will take about 3lb. of yellow ochre to give 1cwt. of cement a cream tint; and about 1½lb. of white, or ¾lb. of green copperas to render the same waterproof. For colouring the plaster already floated, you may try the following, which will last good from three to five years according to the exposure: Mix ½lb. of yellow ochre in three gallons of rain or soft water, add 1lb. of alum well powdered, and one quart of stale beer, stir well and apply with a stubby whitewash brush. For colouring the cement in the stable red, use Venetian red or red ochre, with green copperas 1 to 5. The extra cost will be slight, but the strength of the cement will be somewhat impaired. For superior work, a very fine

and durable coloured cement may be made by grinding up red rubber bricks (or the dust from the cutting shed) with Portland cement, in the proportion of 1 of brick dust and 1 of washed sand to 2 of cement. This can be floated to a marble-like face.

THE SOCIETY OF ARCHITECTS MEMBERSHIP.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be glad if you can give me any information about the examinations for the Associateship of the Society of Architects. How many examinations are imposed? What are the subjects? I have had some experience with an architect. I hold the Art Masters' certificate, and other certificates for Architecture, building construction, &c.—Yours truly,

F. P.

There is no examination for Associateship of the Society of Architects, but there is for Membership, the particulars being obtainable from the Secretary of the Society, St. James's Hall, Piccadilly. The first examination is to be held in October, and the scheme, so far as we are yet able to judge, seems to be a remarkably good one. There is one examination only, the subjects being Design, Architectural History, Construction, Materials, Specification Writing, &c.

THE NATIONAL ART COMPETITION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Students who attend Science and Art Classes are permitted to make architectural drawings, copied, measured, and drawn or designed as he may choose. These are sent up to South Kensington in competition. I intend attending evening classes this session, and would like to send up a drawing. My knowledge of the requirements, however, is limited, and I shall be glad if you can give full particulars, and suggest any suitable subject to draw. The prizes given by the Science and Art Department, I understand, are in money, books, or medals. What would be required of a student to obtain a bronze medal? Would detail drawings and a perspective be required of your design?—Yours truly,

"WHITE ROSE."

The principal requirement for obtaining a national medal or prize is that the work shall exhibit careful draughtsmanship of more than usual artistic excellence. Undoubtedly the best thing to submit is a measured drawing of some good example of old work, with general drawings and details all properly worked out and fully figured, for from the execution of such a drawing, or set of drawings, there is a great deal to be learnt, even if no prize be secured. The original sketches, done on the spot, should be submitted with the finished drawings, but no perspective is necessary.

HOW TO BUILD "TO THE BEST ADVANTAGE."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I purpose building a small house and 150ft. by 18ft. run of glasshouse in this neighbourhood. Can you let me know how this can be done to the best advantage? I have four acres of open farm land, two freehold, and the rest on lease. I do not wish to spend more than £650 on the buildings and stock. Can you let me know how this can be done, and also the nature of the contract with which I would have to enter with the builders, so as to proceed without unnecessary expense and trouble to myself? What form of contract is most binding? I am a subscriber to SPECIFICATION.—I am, yours faithfully,

V. F. G.

P.S.—The place is to be a small fruit farm.

The best thing to do would be to employ a local architect, who would be conversant with local materials and prices, and to whom the requirements could be personally explained. Of course, only a small house could be built—little more than a cottage—as a considerable portion of the sum available would have to be spent on the glass. We should also recommend a careful study of the section relating to "Horticultural Engineer" in SPECIFICATION. The architect would prepare a proper binding contract, and see the work through.

SECOND EDITION

NEARLY EXHAUSTED.

Specification.

No. 2.

The following are some of the unsolicited testimonials received from well-known Architects, Civil Engineers, and Contractors:

"A perfect storehouse of information for Architects."

"Your very serviceable book."

"A Grand Number."

"The more one looks into 'Specification' the more useful does it appear to become."

"We are very pleased to have it in our Library."

"A splendid number of an invaluable work."

"I am greatly pleased with its appearance."

"Unique in English Technical Literature."

"In common with everyone else we cannot but admire your publication."

"Such enterprise as yours is worthy of every encouragement."

"A very excellent production."

"I trust the enterprise shown will be fully recognised."

"I wish you every success in so useful a publication."

"I consider it a very useful publication."

"We congratulate you on the issue, which is very good."

"The publication is well timed, and I trust it will meet with the appreciation it deserves."

"We are bound to say it is a wonderful production."

"'Specification,' appears to be a most invaluable work and one excellently arranged and printed."

Plans and specification may be seen at the Office of Mr. HARRY A. DANCEY, 26, Clarence-street, Gloucester, between TEN a.m. and FIVE p.m.

The quantities are being prepared by Mr. DANCEY, and may be obtained from him on payment of a charge of £2 2s., which will be returned on receipt of a bona-fide Tender.

The Committee do not pledge themselves to accept the lowest or any Tender.

Tenders, endorsed "Tender for Electricity Works," to be delivered at the Town Clerk's Office, Guildhall, Gloucester, before ELEVEN o'clock on MONDAY, SEPTEMBER 19th, 1898.

By order,

GEO. SHEFFIELD BLAKEWAY,

Town Clerk.

Guildhall, Gloucester,
August 30th, 1898.

CONTRACT for GAS HOLDER.

The Directors of the Eastbourne Gas Company are prepared to receive TENDERS for the CONSTRUCTION, at their Works, of a GAS HOLDER, 155ft. by 90ft.; to be in accordance with the drawings and specification, which may be seen at the Office of the Company, at Eastbourne, and of which copies and detailed particulars may be obtained on application to the Engineer, Mr. H. E. JONES, Gas Works, Harford-street, Stepney.

Sealed Tenders, marked on the outside, to be delivered to me by WEDNESDAY, SEPTEMBER 28th, 1898.

The person whose Tender is accepted will be required to enter into a contract for the due performance of the works, and to give such security as the Directors shall require, such contract and security to be prepared by the Solicitors of the Company at the expense of the contractor.

The Directors will not be bound to accept the lowest or any Tender.

J. H. CAMPION COLES,

Secretary.

TO BUILDERS.—Builders desirous of

Tendering for the ERECTION of a BLOCK of RESIDENTIAL FLATS ("Priory Court"), Mazenod-avenue, Hampstead, are requested to apply to the Architects, Messrs. PALGRAVE and CO., 28, Victoria-street, S.W., with a deposit of £2 2s. for bills of quantities, prepared by Mr. GEORGE STEVENSON. Such deposit will be returned on receipt of a bona-fide Tender.

**WOOD-BLOCK PAVING.**

(MR. WHITE'S SYSTEM.)

For Churches, Schools, Offices, &c.

Estimates and full particulars on application to

THOS. GREGORY & CO.,

WOOD PAVING AND STEAM JOINERY WORKS,
Clapham Junction, S.W.

BECKENHAM URBAN DISTRICT**COUNCIL.****TO CONTRACTORS.**

The Beckenham Urban District Council invite TENDERS for WIDENING Croydon-road and Elmers End-road.

The works comprise the widening of Croydon-road for about 800 lineal feet, and of Elmers End-road for 150 lineal feet, together with the formation of new footways.

In connection therewith the following works are required, viz., about 800 lineal feet 9in. pipe sewer, 700 lineal feet 9in. pipe surface water drain with manholes, gullies, &c.; 110 lineal feet concrete retaining wall, about 4ft. high; 1000 lineal feet kerb and channelling, making up roadways, &c.

Plans and sections may be seen, and bills of quantities, specifications, and forms of Tenders obtained, on application to Mr. JOHN A. ANGELL, Surveyor, on or after SEPTEMBER 7th, on deposit of £1, which will be returned on the receipt of a bona-fide Tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders duly sealed and endorsed "Tender for Widening Croydon and Elmers End-roads," to reach undersigned not later than FOUR p.m. MONDAY, SEPTEMBER 26th, 1898.

The Council do not bind themselves to accept the lowest or any Tender.

By order,

F. STEVENS,

Clerk to the Council.

August 30th, 1898.

WILLIAM L. KING,

Electrical Engineer,

11, BOTHWELL STREET, GLASGOW,

Contractor for Light & Power Installations,

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

Surveying and Sanitary Notes.

OWING to the continued drought, a water famine prevails at the township of Willesborough, near Ashford, Kent. All the ordinary sources of supply have failed, and temporary arrangements with the Ashford Urban District Council for a supply of drinking water have been found necessary. The drains at Willesborough cannot be flushed, and, in consequence, there has been a serious outbreak of scarlet fever. The hospital is full of patients, and other cases are being treated outside. At Ashford the Urban Council has been obliged to issue a notice asking consumers to use the town water economically, and to prevent any waste.

THE Ninth Annual Congress of Scottish District Councils, in connection with the National Registration of Plumbers, was opened at Glasgow a few days ago. The congress has brought together many prominent and influential persons connected with public health and sanitary matters, and amongst those present were Messrs. Cameron Corbett, M.P., J. S. A. Baird, M.P., Lees Knowles, M.P., Sir Robert Pullar, Alderman Richard Hind, Master of the Worshipful Company of Plumbers, Professor Glaister, the Rev. Dr. Boyd, and Mr. Robert Crawford, ex-Chairman of the Health Committee of the City of Glasgow and president of the congress. Baillie Dick, on behalf of the Glasgow Corporation, welcomed the members of the congress to the city, after which Mr. Robert Crawford delivered his presidential address. The congress then proceeded to consider what means could be taken to secure the early passing of the Plumbers' Registration Bill into law, and passed the following resolution:—"That this Ninth Annual Congress of the Registered Plumbers, local health authorities, medical men, and educationalists in Scotland, renews its approval of legislative sanction being given to the registration movement, and its desire that the Bill be reintroduced next session of Parliament; recommends that a strenuous effort be made by the promoters of the Bill, by deputation or otherwise, to induce the Government to adopt the Bill; and calls upon the district councils of Scotland to take prompt and energetic action for the same object." An exhibition of plumbing work and sanitary appliances in connection with the congress was opened by Professor J. G. McKendrick, who, in the course of his address, stated that the congress had a twofold aspect, on the one side as it affects the trade, and on the other as it affects the public. All were aware that the movement for the registration of plumbers, so far as the trade were concerned, aimed in the first place at a careful education of the plumber, and in the second at a system of examination and registration by which a guarantee would be given to the public that those who followed the working of plumbers would be thoroughly efficient men.

THE want of water at Bridgend has long been keenly felt, and two or three years since a large number of the inhabitants petitioned the District Council to take steps to procure a sufficient supply. Since then schemes have been submitted to both Bodmin Rural District and St. Winnow Parish Council. Some few weeks ago the former Council's surveyor took the levels and gaugings of springs rising in the surrounding hills, and found that a stream rising at Hartswell gives 19,440 gallons of water in twenty-four hours, and the estimated cost of bringing it is £462. Another spring at Colbeacon gives 8640 gallons, and it can be brought in for £406. The third source of supply is at Polsee, which gives 15,120 gallons in twenty-four hours, and £282 would be the cost of bringing it into the village. These estimates do not include the cost of purchasing water rights from owners and compensating occupiers; they provide only for piping and the provision of four stand-pipes. At a recent meeting of the Rural

Council the three schemes were submitted, and were referred to the Parish Council for consideration. The latter body have gone fully into the subject, and have decided to recommend the Hartswell stream as the most suitable. It now remains for the Rural Council to take the necessary steps.

AN inquiry has been held at Oulton Board School, Lowestoft, by Mr. Samuel Walter Wheaton, M.D., an inspector of the Local Government Board, into an application by the Mutford and Lothingland Rural District Council for powers to borrow £2700 for the purpose of constructing an isolation hospital for the district. It was explained that some time since Dr. Bruce Low held an inquiry into the causes of the typhoid outbreak at Kessingland. The result was that an isolation hospital was recommended. The building would cost £2225. A site had been obtained of the Lowestoft Charity Board of 1½ acres for £150. The furniture would cost £200. It was as nearly as possible in the centre of the rural district. As this was an entirely new charge they hoped the Local Government Board would spread the repayment of the loan over as long a period as was possible under the Public Health Act. The architect (Mr. Clarke) explained the plans, into which the inspector entered with great minuteness, and the inquiry closed.

A SINGULAR accident occurred at Messrs. Levinstein's Works, Crumpsall Vale, Blackley, last week. The Manchester Corporation has been constructing a sewer under the works of the firm, and the timbering used does not appear to have been sufficient to keep up the bed of the private reservoir, which is over an acre in extent and in some places 20ft. deep. The bottom gave way, and the immense volume of water burst out over the surrounding country. The roadways and gas and water mains were severely damaged; but the pipe sewer suffered no harm, although the brick-work casing was considerably damaged.

THE engineers have commenced the initial work of laying down the 20in. mains in the Tower Subway to connect the East London Waterworks Company with the Southwark and Vauxhall Company. A large gang of workmen is employed sinking a 60ft. shaft at both ends of the tunnel. About two miles of 20in. piping will be required for the purpose, the connection with the Southwark and Vauxhall Company being made in Bermondsey Street, on the south side of the River Thames. The main will emerge from the subway close to the Tower, and will be taken along Tower Hill to Leman Street, a distance of about a mile, where it will be connected with one of the great mains of the East London Company. The laying of the connecting main, which will necessitate the breaking up of about a mile and three-quarters of streets, will take six weeks to accomplish, with two gangs of workmen working at high pressure both day and night.

ON the 21st inst. the Corporation of Plymouth celebrates the completion of the Burrator Reservoir. This reservoir has been constructed by the Corporation. Its main embankment is the third largest stone dam in the country, and is the only one constructed of granite. The engineers for the scheme are Mr. James Mansergh, engineer, of Victoria Street, and Mr. Edward Sandeman, of Plymouth. The waterworks of the Plymouth Corporation are believed to be the oldest waterworks established by a municipality which have been continuously in the ownership and under the control of the municipality since their inception. London, as a municipality, undertook the construction of waterworks before Plymouth, but London has parted with its waterworks undertakings as a municipality, and is now entirely supplied by companies. The Plymouth waterworks have the further additional interest in that they were constructed by Sir Francis Drake, the great navigator, under powers obtained in the reign of Queen Elizabeth, the Act of Parliament showing on its face that they were designed at that day not merely for a local but also for

an imperial purpose, viz., "the deepening of the Plymouth Harbour, supplying Her Majesty's ships of war, and also for the purpose of extinguishing fires in the town occasioned by the assaults of foreign Powers."

TROPICAL heat and continued absence of rain in the Midlands are severely taxing the resources of the Birmingham Water Department, and the authorities have issued a warning to the citizens that it has become impossible to maintain a constant supply in the higher districts. The storage has considerably diminished during the past few weeks, and the scarcity is causing some anxiety. The citizens are urgently requested to economise the use of water, though it is hoped the drastic measure resorted to in London will not be found necessary.

THE report of the Sanitary Committee of the Manchester Corporation for the past year shows that the large number of 42,805 complaints of nuisances have been dealt with, and the twenty-eight district and four smoke nuisance inspectors have made 73,539 inspections of various kinds, and have applied smoke and water tests with the view of discovering any defects which might exist in the drainage at 2266 houses. The notices which have been served for the abatement of nuisances of various kinds number 12,888, and 427 magistrates' summonses have been issued under the direction of the Committee for non-observance of such notices. Great efforts have been made to mitigate the nuisance arising from the emission of black smoke from the chimneys of works, &c., and special attention has been given to the works in the newly incorporated districts, with the result that a very great diminution of the nuisance has been effected. Two new underground lavatories have been opened—one in South Street and the other in Great Bridgewater Street. The House Drainage Department have restrained no fewer than 5905 dwelling houses and 274 business premises, public buildings, &c., during the year. The cost of this work amounted to £29,359 19s. 3d., which was apportioned as follows: £20,657 4s. 7d. to owners, and £8702 14s. 8d. to the Highways Department, to be paid out of the City Fund.

"A Nearly Smoked Out Inhabitant" writes complaining of the non-abatement of smoke. He says:—"This nuisance has simply become intolerable, and up to the present seemingly unchecked by the local vestries. There is one particular shaft the worst offender, situated at the back of Lincoln's Inn Fields, on the west side. All through this exceptionally hot weather, and for many months before, it has been impossible to have the windows of the house where I reside in open, no matter how unbearable the heat has been, without having every room in the house filled with this soot-depositing, oily-smelling, noxious vapour, detrimental alike both to health and property. I do not believe in the excuse put forward that the coal strike in South Wales is the sole cause, for every furnace should be so constructed as to be independent of such casualties as the want of a particular sort of coal. There are three institutions in Lincoln's Inn Fields—the Inns of Court, the Royal College of Surgeons, and Sir John Soane's Museum, all possessing valuable libraries and priceless works of Art. Why should their valuable contents, which are national treasures, be ruined because a private company would rather poison the air and obstruct heaven's light than spend a few pounds on altering their furnace?"

THE Government has offered the City Corporation the male wing of Newgate Prison for £40,000, and this offer has been readily accepted. It has had the effect of altering all previous plans. The new Sessions House will be built upon the present site of the male wing, abutting upon Newgate Street, and the site of the old Sessions House will probably be let for building purposes. The cost to the City will be about £200,000, which will have to be provided by means of a county rate spread over between twenty and thirty years.

THE CREMATION OF SEWAGE.

THE sewage disposal problem is beginning to engage the attention of the clergy, though it is evident from a letter which the Rev. J. W. Sheringham, Archdeacon and Canon of Gloucester, has written to the Times that the clergy—or at any rate, Archdeacon Sheringham—is not up-to-date in his practical knowledge of the subject. The reverend gentleman's cremation theory is no new idea; but with his remarks on river pollution all must agree. The letter is as follows: "There are few evils in my opinion more pressing or even scandalous than the pollution of rivers. Water is one of God's most precious gifts (poor East London will testify to this). To turn a fair river into a foul drain seems to me not only a hideous blunder, but a hideous crime. Will you let me open a correspondence on the cremation of sewage, for our pest may thus be turned even to our advantage? I plead for the erection of huge furnaces at the outfalls of our drains. No doubt they would require lofty chimneys and chemical ingredients to neutralise the noisome gases, but this, surely, cannot be beyond the reach of science. In these furnaces the solid matter would be burnt and form artificial manure, the liquids, being properly filtered and deodorised, might then be allowed to flow away. Let us sum up our present position. Our beautiful West Riding rivers are only awaiting their time for being turned into foul channels of manufacturing centres. 'Sabrina Fair' is rapidly becoming 'Sabrina Foul,' to the great discomfiture of the salmon. Limpid Thames is condemned to bear

THE IGNOBLE BURDEN OF LONDON SEWAGE.

Have we not heard of a huge sewage island being piled up on the borders of Essex? Have not the oyster sellers been half ruined by sewers disgorging themselves near the oyster-beds of Kent? Have we not heard of the 'Ealing Styx,' the Brent? Fifty-seven years ago my father had his kitchen garden surrounded by that pretty river at Hanwell. I am now staying on the coast of South Hampshire. A nice little trout stream empties itself past the village into the sea, up the stream trout are caught abundantly, below the houses large fish are caught but ought not to be eaten, for a disgusting freight of sewage is carried to the sea, and Oceanus has to dispose of accumulated poison as best he may. Shame to say, it is the same story for all our watering-places. Could the Chancellor of the Exchequer use a cool million better than to establish by grants (repayable, if you will) crematories for all our great towns and cities? Now, what are the palliatives on which we place our reliance? Miserable subterfuges indeed—sewage farms. At first we heard much of the enrichment, now we hear of the poisoning of the soil; at best it is the spread of noisome exhalations over fair fields instead of fair rivers. I do not envy the olfactory senses of the man who walks anywhere near the sewage farm. The huge sewage marsh at Saltley, near Birmingham, had to be thickly covered by masses of sand and gravel. I suppose to be in their turn as much poisoned as the stratum which lies below them. No doubt we must come to cremation sooner or later, but why not sooner than later? I throw out this suggestion to be taken up, I trust, by practical and scientific men. I am sure he will be a public benefactor who can turn a curse into a blessing."

CROYDON is reputed to be a healthy place, and its Corporation is generally supposed to be sufficiently aware of it; but one of its latest notions is a curious one, as bearing upon sanitation. It has decided to charge, and it has been charging, householders for taking away vegetable matter, and the natural result is, of course, found to be that hundreds of small centres of smells are rising up. Before evidence, one would imagine that the first conditions of health in a town is the most complete system for removing decaying vegetable matter, but the Corporation of Croydon does not seem to see it.

Builders' Notes.

"GRAVEL SOIL" is generally looked upon as healthy, but the Hospital this week shows that this is by no means always the case:—"A foul gravel is a most dangerous soil on which to build. For warmth, for dryness, for absence of fog, and for facility of walking directly after rain, just when the air is at its purest and its best, there is nothing like gravel; but when gravel has been rendered foul by infiltration with organic matter, it may easily become a very hot-bed of disease, and in relation to this one must remember that those who dwell in suburban villas, and in houses built in rows, are apt to suffer from the sins of their neighbours so far as the subsoil is concerned." Where houses are planted at some distance apart, each standing in its own plot of ground, gravel is admirable; but whenever houses are so closely placed that the soakage from one may interfere with the ground air of another, gravel is but a doubtful blessing.

A NEW way of pulling down old buildings in London is commended in the following communication from Mr. W. Woodward, A.R.I.B.A.:—"An idea, which a short time ago I saw being carried out in Nuremberg, I have just adopted in the pulling down of two houses in Regent Street, and with most satisfactory results. I took a main pipe to the top of the old houses, with branches, to each of which was attached an indiarubber hose, with sprinkler at the end. Before the work was pulled down the walls and ceilings were sprinkled with water, and then the debris was likewise sprinkled with water before it was basketted out to the carts in the street. The result was that the usual clouds of dust, with their attendant mischief and annoyance to the public and to shopkeepers, were entirely absent, and the 'wreckers' were at the same time benefited. I venture to commend the idea to the London County Council, who might well insist upon its adoption in all cases of pulling down old premises in London."

VERY few of those hundreds and thousands who daily travel the wood pavement laid down in so many of our London thoroughfares, or who have at some period of their lives stood and watched the process of laying it, have much idea of where all this wood is obtained, nor have they, says Chambers's, any idea of the process used in cutting it into blocks of the requisite size. Various kinds of woods from all parts of the world have been tried, and of late years the Tasmanian "stringy bark," a species of the Eucalypti, has proved to be the most enduring, and without the glass-like surface of some other hard woods. The stringy bark, which grows all over Tasmania, has a rougher surface than the blue gum, thereby giving in greasy weather a better foothold for man and beast. It is in the south of the island of Tasmania that the chief supply of timber is obtained, the forest coming down almost to the water's edge, thus making the cost and difficulty of transport very small; in fact, at some of the mills vessels of three thousand tons could partly load alongside the pier, and complete their loading by barges while lying in a perfectly secure anchorage. As regards the lasting powers of the stringy bark, that, of course, has to be proved, but judging by the durability of the railway sleepers on the Government lines, a renewal once in seven years ought to be sufficient.

THE Midland Railway are about to erect an hotel in connection with the Central Station, Manchester. The hotel will have frontages to four streets. The material for the structure will be granite for the lower part, and terra-cotta above. A concert hall will be a feature of the design.

IMPROVEMENTS are now being carried out at the London Hospital. These alterations and enlargements include the removal of the old spinal wall running between the two main

wards back and front, which will secure a needed cross-ventilation hitherto unattainable; the building of a complete set of modern and efficient operating theatres; the provision of a new out-patient department; better isolation accommodation; the construction of a new mortuary and post-mortem rooms; and the addition of a photographic and Röntgen ray laboratory. The hospital garden is given over to an army of workmen, who are engaged in erecting a temporary structure for the accommodation of the patients, numbering over 100, who will have to be moved from those wards soon to be rebuilt and enlarged. The building in connection with the Röntgen ray science has also its locale in the old garden site, and it is expected that this development in the medical school will be of immense value to the hospital. The four new operating theatres will be models of all that modern science can devise. Their construction will cost some £13,000, which is being defrayed by an Australian gentleman settled in this country. They will be fitted with an apparatus which will force ice-cooled air into the theatre during the hot weather, and warmed, ventilated air during the winter months, the pressure being such that under all circumstances there will be a current of air passing from the interior outwards, carrying off any septic impurity in the atmosphere. Besides being the largest hospital in the world, after that in Vienna, the London Hospital bids fair to be also the most efficiently equipped and most advanced scientifically, when all the present plans are perfected, and for the furtherance of which both private and public generosity have done so much.

M. BERLIER, the engineer who has recently conceived a scheme for uniting Europe and Africa by means of a submarine tunnel, starting from Gibraltar, and some 32 kilometres in length, has just expressed himself in very sanguine terms. He anticipates, in fact, cordial support from the English side of the Channel. A train leaving Boulogne or Calais could thus take the traveller rapidly through France and Spain to Morocco, and thence by way of Algeria, Tripoli, and Egypt, the Suez Canal being also tunnelled, to Arabia, and so along the coast to the Persian Gulf to Bombay.

THE building of the Great Central Railway's London terminus in the Marylebone Road goes on steadily, although the date on which the line will be opened for passenger traffic still advances into the future. October was spoken of a while ago, but now January next seems the more likely. This is not to say that progress has been slow. On the contrary, Marylebone Station has arisen with astonishing rapidity, and it already is nearly ready to receive the glazed roofing of the three bays into which the two arrival and two departure lines, together with the line for sidings, will run. But little unforeseen contingencies occasion additional work and retard completion.

THE station offices, in red brick and yellow terra-cotta, are decidedly pretty. A great London terminus should perhaps be imposing. The Great Central is not that, but it is distinctly comfortable looking. It is the great hotel being erected here, the Hotel Grand Central, which is majestic in its height. This is not an undertaking of the Railway Company's, but is being erected for the Gordon Hotels Company. It will have a garden courtyard and the latest conveniences. The principal elevation, which fronts the Marylebone Road, is of the same style and materials as the station buildings. The goods' yards, the great bonded warehouses now being completed, and the immense coal-sidings now actually in working order and filled with laden coal-wagons from the collieries of the Midlands, give an excellent idea of the magnitude of the carrying trade in coals, minerals, and general goods which the Great Central will carry on. Already the Company has obtained powers for the doubling of these coal-sidings, and property in the neighbourhood has been scheduled for purchase and demolition.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEORGE ELLIS.

IX.—WINDOWS.

(Continued from page iii.)

SLIDING SASHES are used for small openings in thin walls, but are seldom satisfactory, having a tendency to jam and cause the glass to break; also, if not in constant use, the rails upon which they slide get corroded, and the sash is difficult to move. Two forms of these frames are made, in one of which two sashes sliding in opposite directions are used, in the other, called a Yorkshire light, there is one movable sash, the remaining portion of the frame being rebated to receive the glass as shown in the sections Figs. 151 and 152. In sliding sashes there should be no end wood exposed at top or bottom, as it would be liable to splinter off in the working, and it is usual for the rails to run through or to be shouldered over the stiles as shown in Fig. 153.

DORMERS.—Vertical windows in a roof are called dormers. Frequently they are formed with ordinary sash frames fixed to the studding of the sides of the dormer, but in the prevailing style of Architecture they become important features in the design, and are constructed with massive timber frames, wrought and moulded, and the sashes hung as casements. Fig. 154 is an elevation, and Fig. 155 a vertical section of such a window. Fig. 156 is an enlarged section showing method of hanging casements.

SKYLIGHTS are windows in a roof in a parallel plane with it. When it is desired to make one of these, an aperture of the required size is formed in the roof by framing pieces, called trimmers, between the outer rafters, to carry the ends of the intermediate ones. The rough frame thus formed is covered by a lining of 1½ in. stuff, standing about 6 in. or 8 in. above the roof, and flush with the underside of the rafters, or plastered ceiling.

* All rights of reproduction reserved.

FIG. 152. HORIZONTAL SECTION OF YORKSHIRE LIGHT.

FIG. 151. VERTICAL SECTION THROUGH SASH IN YORKSHIRE LIGHT.

FIG. 153. DETAIL OF SLIDING SASH.

FIG. 154. ELEVATION OF DORMER WINDOW.

FIG. 156. SECTION AT A-B, FIG. 154.

FIG. 155. SECTION OF DORMER.

When this lining is framed either by grooving or dovetailing it is termed a curb. Upon this curb the light is fixed, overhanging the outside about 2 in. all round, the underside being throated to intercept the water. A tongue should be worked on the top edge of the curb and a stopped groove in the light to receive it. When the light is hung it should be at the top end, and the lead flashing brought up the outside of the curb and turned over the top edge, and there formed into a little gutter to receive any water that might drift through the joint. As these lights are more or less flat, the rain-water does not escape so rapidly as from ordinary windows, and there is greater risk of it getting round the edges of the glass. To prevent this as much as possible the top rail is grooved for the glass, instead of rebated, and the bottom rail is made thinner than the rest of the framing, its top side being flush with the rebates, to allow the glass to run over. The rebates of the stiles and bars are throated, and a sinking worked on the upper edge of the bottom rail to receive the condensed water, which is discharged outside by its continuation under the tail of the glass. Fig. 158 is a longitudinal section, and Fig. 157 a plan of a framed skylight.

(To be continued.)

THE Town Council of Maidstone has resolved to apply to the Local Government Board for sanction to borrow £6020 for reconstructing the old brick sewers in the borough in accordance with plans prepared by the borough surveyor.

A LOCAL GOVERNMENT BOARD inquiry was held in Cheltenham recently by Col. J. T. Marsh, R.E., relative to the application of the Town Council for sanction to borrow £13,410 for certain works of sewerage and sewage disposal, which the Council proposed to construct outside the limits of the borough.

FIG. 157. PLAN OF SKYLIGHT.

Hospital Extension at Keighley.

TEN memorial stones in a new block of buildings being added to Keighley and District Hospital have been laid. It is estimated that the total cost of the extension will be £22,000. The architect gives the following description of the additions:—The extension comprises administrative ward, kitchen, and operating blocks, all connected with the present hospital by corridors 9ft. wide. The administrative block has on the ground floor a large board room, dispensary, and staff room, doctors' sitting room and bedroom, with bath and lavatory accommodation; matron's, nurses', and probationers' sitting rooms; office, waiting and porters' rooms, and a casualty room. On the first and second floors are the matron's bedroom, thirty nurses' bedrooms, and a sick room, with ample bath and lavatory accommodation. The ward block will be two stories high, and will have accommodation for forty-four beds—in two large wards, 70ft. by 27ft., each containing sixteen beds; two four-bed wards, 27ft. by 19ft.; and four single bedrooms for special cases, two day rooms, 21ft. by 17ft. Also the necessary nurses' kitchen, duty rooms, store rooms, and baths and lavatories. The floors of the wards will be of polished teak. At the south end of the large ward will be a verandah, with iron staircase for escape in case of emergency. The kitchen block at the rear of the administrative ward will have on the ground floor a kitchen 24ft. by 23ft., scullery, nurses' dining room, servants' hall, sewing room, and a number of

store rooms; on the first floor eight bedrooms (for ten beds), bath room, &c.; in the basement are three large larders or keeping cellars. At the rear of this block is a large boiler house and boiler chimney. The operating block (between the administrative and ward blocks, and approached by a covered corridor) will have an operating-room 26ft. by 18ft., anæsthetic room, instrument room, and store room. At the rear of the site, and detached from the other buildings, is the mortuary block, comprising mortuary, post-mortem room, viewing room, and waiting room. Due attention will be paid to the efficient ventilation and warming of the various rooms—the warming is intended to be on the low-pressure hot-water system, with ventilating radiators. Each block of buildings is provided with a large extracting shaft, into which the foul air from every room is drawn by means of steam coils. The accepted tenders for the building contracts amount to £14,073 (this amount is exclusive of warming, terrazzo flooring, and other specialities). The cost of land, £3000, and fittings and furnishings, £4000, with smaller items, bring the sum estimated to be required for the building to £22,000. The architects are Messrs. W. and J. B. Bailey.

A PORTION of a block of buildings in Ellesmere Street, off Hulme Hall Road, Manchester, collapsed a few days ago, the roof and the two floors beneath crashing to the ground simultaneously. The accident is assumed to have been caused in some way through the removal of a large boiler in the basement.

Trade and Craft.

MESSRS. MELLOWES AND CO.

The whole of the glazing at the new station at Nottingham, to which we referred in our last issue, is being done on Messrs. Mellows and Co.'s patent Eclipse imperishable system. The same firm is doing the whole of the glazing on every station of the Great Central Railway extension to London. This, we should imagine, is the largest glazing contract ever given to one firm.

THREATENED STRIKE AMONG PLASTERERS.

A correspondent informs us that the Plasterers' Trade Union has decided to give notice at the end of the present month that unless the usual wage of 10d. per hour is increased by one penny a general strike will be declared. This has not caused much surprise in the building trade, because it has become a recognised fact that a plasterer may now demand practically whatever wage he requires. A competent man finds no difficulty in making a clear £2 10s. a week.

Shooting to be had in the neighbourhood. Plate and linen nearly new. Comfortably furnished.—Terms and full particulars as above.

Messrs. WALTON & LEE,

10, Mount Street, Grosvenor Square, London, W.

To Builders, Small Speculators, and Others.
SOUTHALL, MIDDLESEX.

A number of Valuable Freehold Building Sites, comprising a portion of the highly favoured building estate, known as "The Southall Building Estate," situate in the parish of Southall, about five minutes' walk from Southall Station on the Great Western main line, about twenty-five minutes by rail from Paddington, and thirty-five minutes by rail from the City. The estate is laid out with a 45ft. road, planted with trees this autumn, sewered and kerbed and channelled; and house connections being laid up to the edge of the footpath.

The sites facing the High-street are eminently suitable for the erection of good class shops, whilst those facing the Lady Margaret-road are intended for villas with rentals of from £30 to £40 per annum, for which there is a great demand.

MESSRS. WALTON and LEE will offer the above for SALE by AUCTION, at the Red Lion Hotel, Southall, Middlesex (about five minutes' walk from Southall Station), on WEDNESDAY, SEPTEMBER 21st, 1898, at SEVEN o'clock precisely in the evening of that day.

Particulars of sale may be obtained of Messrs. FRESHFIELDS and WILLIAMS, Solicitors, 31, Old Jewry, E.C.; or of the AUCTIONEERS, at their offices, 10, Mount-street, Grosvenor-square, London, W.

FOR SALE.

FREEHOLD.—SANDFORD-HOUSE and ESTATE, Godshill, I.W.

Six rail stations within one to four miles.

Matchless beauty, splendid views and soil, mild climate, majestic, rare evergreen trees, &c.

Either as one property, or in portions to suit buyers, viz.:

1. The HOUSE, with a beautiful cottage and any portion of gardens and grounds.

2. The FARM, with 60 acres good land, part adapted for building development.

3. The BUILDING LAND, skirting the High-road to Godshill.

4. The SEVEN perfect STONE COTTAGES.

5. The 12 ACRES of MARKET GARDENS, and several old and new orchards, &c.

6. The EIGHT GLASS FORCING HOUSES, splendid vineries, peach, tomato, cucumber, melon, and fig houses, &c.

7. The important matured NURSERIES, several acres of rare trees, shrubs, evergreens, &c.

(Nos. 5, 6, and 7 are all going concerns.) Part of the purchase money may remain on mortgage. For particulars, &c., apply to Messrs. DOWSETT, KNIGHT, and Co., 3, Lincoln's-inn-fields, London, W.C.

Some Latter-Day Proclivities.

WITHOUT assuming to any special knowledge

upon the subject of fowls or chicken runs, it is yet with unwavering confidence that one pronounces it to be not the hen that cackles loudest which lays the most eggs. There are at least three plausible and seemingly sound reasons for believing this to be true. First, it will be manifest that the more enthusiasm a hen puts into the business of her cackling, the less attentiveness will the insect have to bestow upon the subject of her eggs. Second, the condition of insect which gives itself up to inordinate self-applause and demonstration of its own achievement, is by nature constitutionally unfitted for concentrated effort, and incapable of excelling in any serious occupation such as one imagines eggs to be. Third, the hen that spends her hours in strutting and crowing, in meditating and approving her great accomplishment in eggs, in analysing the nature and quality of her gifts and merits, and in estimating her importance as a furnisher of the breakfast table, the hairdresser's shop, and the political hustings, probably achieves no such end as she pictures; but is rather keeping worthy people awake in their beds, destroying the smiling peace of mind and self-satisfaction of the hen-loft which is so essential to the laying of eggs, and aiding and abetting the depredation of a colony of rats, who steal away the very subject of her congratulations in the moments of her shrillest elation. Everyone has been taught why it is that a hen lays eggs. It is reputed to be the ambition of the creature to lay bricks, but failing that, she has perforce to content herself with eggs merely. Between a hen, therefore, and an architect who *does* know how to lay bricks there exists an inherent comparison, but the analogy one would here particularly emphasise, lies in the matter of the cackling. The characteristic modern architect, the art worker, and indeed the whole brood of latter-day artists are cackling, prattling creatures like the hens; and, like the hens, this habit of prattle, self-analysis, and introspection, has dire results upon the fruits of their labours. The tone of Art in England is eminently self-conscious; it is almost entirely personal and egotistic. War, plague, revolution, any far-reaching national calamity, or, indeed, a sudden accretion of the country's supremacy or prosperity, would startle and spur these acolytes and hermits who hold and guard the Arts, into a living activity, and a

great epoch in the history of Art would blaze up in the self-forgetfulness, self-abnegation, and passionate enthusiasms or griefs such a day would witness. But, as things rest with us to-day, the typical practitioner is not concerned with the loves, hopes, fears, or ambitions of his country or his creed at all, but entirely with the phenomena of his own personal sensations. He remains secluded, and focussed upon himself, much as Carlyle describes of a certain epoch in philosophy; whose votaries studied their own navels in hopes of reading therein the mystery of Nature. The modern artist sucks his own paws. He lives in a den, and, for the most part, feeds his inspiration by turning over a collection of ancient bones that fed masters of the past, but now lie about him bare and polished by usage. The motive and origin, the artistic tendency and value of each of his creations, is gauged and estimated by him, and widely discussed and debated from the many standpoints of theory and practice, ethics and aesthetics, even before the work is an indubitable fact. Hardly any individual work—and everyone

now is nothing if not individual—is an instinctive effort at natural expression by the artist, but is rather the elaboration of a theory or a principle which has already been analysed, and its value and position in the field of Art already measured and estimated by its creator. As has been already said, the artistic instinct in this country is one of self-appreciation and analysis, manifested in the prattle and pedantic technicalities of the studio, and the jargon of the professional critic, which has surged over all bounds of fitness, and is now to be met with in the byeways of the popular magazines and newspapers. In no epoch of history has Art, as now, been typified in the person of a precocious imp capering about in every incongruous costume, and clamouring to be noticed. "It is the witness still of excellency, to put a strange face on his own perfection," and in Art the converse of this saying (spoken by Don Pedro in Shakespeare's play) is of equal wisdom; and true excellency implies self-forgetfulness in the artist, who must, above all things, be a stranger to his own perfections. B. C.

Ilminster Church

AN ARCHITECT'S HOLIDAY ON A BICYCLE. ILMINSTER CHURCH. SKETCHED BY R. W. SAMPSON.

The Wayfarer on Some Moorland Architecture.

MOORLAND Architecture, says the Wayfarer, has its own peculiar localisms, its own types and methods of building; lonely cottages, small villages, an occasional manor hall, and remains of the ancient folds, form the principal buildings that have found a place in the solitudes of the Lancashire Moors. The origin of the last-named dates from early and unsettled times, when the severity of the forest laws drove many people into the woods and caves for fear of falling into the hands of the authorities, and when they were disappointed of game and other provisions, they sallied out at night and took the nearest cattle they could find. This caused the farmers to combine for mutual protection, and settle on certain places for public folds. Around these folds they built their houses and farm buildings, so as to enclose them on every side with the exception of a large doorway for access and exit. These buildings all faced inward, and originally there were no back doors, so that when the cattle were shut in at night, and a good dog left to watch, the inhabitants of the house or fold considered themselves tolerably safe.* There still exist a few in almost their original state, and frequently remains are found upon the moors turned into farm buildings, new erections being attached to the old for the purpose of carrying on farm work. Ancient folds, moorland cottages, and manor halls of these districts have much the same character and feeling, the same grey sombre tone as typical of the moors, as of the structures that have grown thereon. Time and also the methods of building has brought about the close kinship existing between the moor and the homestead. Stone is the usual material for the outer shell of the buildings, the roof being covered with stone slabs. Large stones (sometimes a kind of granite) are used at the angles, and also for the door jambs, varying in size from 2ft. 6in. to 3ft. 6in. and even 4ft. in length, from 6in. to 9in. on bed, and from 8in. to 15in. in height. Colossal stones frequently span the door openings. The mullions of the windows are placed about a foot apart, the openings being filled in with small panes of clear glass in leads quite an inch in width. The gable copings are square on edge, and about their own thickness above the stone slabs of the roofs. Near the apex of the gables are generally small square stones with circular piercings, without chamfer or moulding. All the main portion of the walling is built of smooth face parpoints, several courses in the height of the angle stones. In some of the buildings these parpoints vary from 1½in. to 3in. in thickness, in others from 2½in. to 5in. and 6in. The wayfarer at this point drew out a small notebook, and with the somewhat irrelevant remark that Edwin Waugh knew the Moorlands, began to read. A deep lonely clough, green only on the lower grounds, and almost treeless, save where some cherished bit of shade overhangs the gables of a solitary farm, or where scanty patches of young plantation fringe the banks of the stream hidden from view. The clough is bounded on each side by wild hills sloping and swelling down in grand billowy sweeps and in some places falling away abruptly in steep bluff of barren crag. The only habitations visible are four or five farmhouses perched here and there, far apart upon the scene. The bleat of scattered sheep and the clucking cry of startled grouse came wildly from the lonely wastes. With an imbecile smile the Wayfarer began to pull out another notebook, but seeing it was a book on cookery and not Moorland Architecture we abruptly left him.

Science and Art Department.

THE ART LIBRARY CATALOGUE.

GENERAL SIR JOHN DONNELLY has written a long letter to *The Times* in vindication of the staff of the Art Library at South Kensington, who have been assailed with allegations of egregious blunders in the compilation of the library catalogue, which blunders have been spoken of "as the crowning instance of mismanagement at South Kensington." The condemnatory article in question appeared in *The Times*, and avowed that "the old catalogue was a scandal, as may be seen from the following extracts from the report:—H. C. Reneue is given in the catalogue as an author's name; it is really a misprint for the French word meaning 'revised.' Deel is also given as an author, the word being the Dutch for 'volume.' The title of a book on the *Marian Annals*, '*Mariani Fasti*,' is transformed into an author's name, *Fasti* being made the surname and *Mariani* the Christian name." Thus maligned, the Staff of the Library, writes Sir John Donnelly, "have represented to the Lords of the Committee of Council on Education that this conveys an unmerited censure on them—I may add also on the late Mr. Soden Smith, who died in 1880, and was Mr. Weale's predecessor as keeper of the Art Library—and they have asked that the facts of the case may be made public in their vindication. I am, therefore, authorised to state that these mistakes do not occur in

THE INVENTORY CATALOGUE OF THE ART LIBRARY,

that is to say, in the catalogue of the library prepared by its staff from the works themselves when put into the library. They occur in the '*Universal Catalogue of Books on Art*,' which was commenced in 1865 and published—avowedly as 'first proofs under revision'—in two volumes in 1875. It was 'compiled for the use of the National Art Library and the Schools of Art in the United Kingdom' from all kinds of English and foreign catalogues and bibliographies by a special staff, distinct from the staff of the library, working under the advice of a very strong committee of English and foreign experts. The catalogue was, as stated in the minute of the Lords of the Committee of Council of October 12, 1865, to 'include not only the books in the library, but all books printed and published at the date of the issue of the catalogue that would be required to make the library perfect; that is, to compile

A UNIVERSAL RECORD

of printed Art books which are known to exist up to that period, wherever they may happen to be at the time; . . . any reader in the Art Library in the museum would thus find a clue not only to the works he was looking for in the actual collections of the library, but to other works. . . . which had been ascertained to form part of other libraries, whether public or not, either in our own or in any foreign country, a reference being at the same time given, in the case of rare books, to the library in which they may be found.' For the use of readers in the library there is, therefore, besides the inventory catalogue—to which I have already referred—of all the books in it, also another reading room catalogue, containing, in addition to the entries from the library catalogue of the books in the library the titles of books out from the *Universal Art Catalogue* of books outside this library. The DIFFICULTIES ATTENDING THE COMPILATION of such a work as the *Universal Art Catalogue* are obvious, and the probability of its containing mistakes—a certain number of which occur, as is well known, in the most carefully prepared catalogues of libraries 'in being'—is rendered far greater, especially in the first proofs, by the difficulty of avoiding the incorporation of mistakes in the excerpts from other catalogues of which it is made up. Of this nature are the mistakes given in the report of the Committee of the House of Commons. '*Deel*,' as may be seen from the entry in the *Universal Art Catalogue*, is taken from the 1864 edition of the '*Catalogue of the Library of the Royal Academy*

of Arts, London.' '*Reneue*' is also only in the *Universal Art Catalogue*; whence it came has not been traced. But another edition of the work to which the entry refers was properly catalogued in the *Art Library Catalogue* in 1865. '*Fasti Mariani*' was also properly treated in the old *Art Library Catalogue* as an anonymous work. The mistake is in the *Universal Art Catalogue*. There seems, I may say, some inherent danger in dealing with this book. The book, which the committee say is 'on the *Marian Annals*,' is in reality a Roman Catholic almanac of *Saints' Days* and *Holy Days*, with short notices and engravings edited by the '*Congregatio Mariana*,' of Munich. A leading daily London paper says:—" '*Mariani Fasti* ' as a proper name is imposing, and to a compiler who did not know Latin or had never read Ovid the suspicion that it was a record of events in Queen Mary's reign might not occur." I trust, Sir, when I add that the mistaken entries '*Deel*' and '*Reneue*' had been struck out in Mr. Soden Smith's time in the copy of the *Universal Art Catalogue* in the librarian's room it has been made clear that, whatever mismanagement there may be, the Staff of the Library—not one of whom was in any way connected with this piece of somewhat ancient history, the *Universal Art Catalogue*—are in no way

RESPONSIBLE FOR THE ALLEGED 'SCANDAL.'

With regard to the statement in the report that there is 'at present no junior in the library who knows German,' I have to state that of the present Staff of the Library, consisting of one keeper, two assistant keepers, and three junior assistants, one of whom was appointed just before the committee reported, all but one, a junior assistant, have a knowledge of German. As this letter is written at the request of, and in justice to, the library staff, it deals only with that portion of your article which directly affected them. I am to add that the more serious matter—the alleged dismissal of Mr. Weale, also referred to in that article—will no doubt be dealt with by the responsible Ministers in Parliament."

MR. SPIELMANN IN REPLY

Following Sir John Donnelly's defence, Mr. M. H. Spielmann winds up for the prosecution. He welcomes the exoneration of the present Art Library staff, and proceeds:—"Beyond this point Sir John Donnelly is much less convincing. His laboured apology for the copious mistakes in the catalogue of the Art Library amounts to this—that 'a very strong committee of English and foreign experts' was formed under the auspices of South Kensington to draw up a catalogue of all the printed Art books in existence, and that the result of the labours of this very strong committee was the rich crop of ridiculous mistakes from which the report has quoted, and with which you have entertained not literary and artistic circles only, but the world at large. Sir John Donnelly pleads that these amazing mistakes were merely absorbed from the grotesque entries and ignorant blunders of other librarians. Is this an excuse that will stand? Was it then only for

THE BLIND COPYING OF ABSURDITIES

that a 'very strong committee of experts' was brought together by South Kensington? Most men, I think, will agree that for the mere adoption of other men's errors, ordinary copyists would have done very well. But this, it should be observed, is the traditional method at South Kensington. Then, when Mr. Julian Marshall, the compiler of the '*Catalogue of National Engraved Portraits*' (which the House of Commons' Committee has recommended for suppression) had perpetrated in it the numerous mistakes of a very laughable description, to some of which you drew public attention, he sent in defence to the Vice-President (see appendix to the first volume of the evidence) to the effect that these mistakes, or some of them, were copied from previous books and catalogues. It does not appear to be understood at South Kensington that when 'experts' are employed it is popularly expected that original work will be given, not the unsuspecting incorporation of the mistakes of ill-informed pseudo-experts who have gone before."

An Architect's Holiday

PART II.*

THEN there is the Burford Priory, and, oh, what sadness comes over one as you look on that which is now, simply through neglect, a mouldering ruin, but what was once a stately mansion, the home of Lenthal, the Speaker of the Long Parliament, and many a noble owner before and since.

The house appears to have been a Tudor building originally, and to have been added to in the days of the Renaissance. The chapel was once a beautiful bit of work in the later Renaissance style, and a considerable portion of it may now be made out, but it is dangerous to go inside, and in a few more years the whole place will become, no doubt, a hopeless ruin.

There are lots of other things to see in this old-world town, and not the least interesting of them is the front of a cottage, which I have sketched, situated round a bye lane, shut up and deserted, and, doubtless, like its great neighbour, the Priory, doomed at no distant date to destruction at the hands of Time and his great helper, Neglect. One can only imagine that it must have been the humble home of a plasterer, who, for the love of it and his craft, scratched that simple and beautiful design, with the date, 1688, on the front.

Now, if you are ready, we will make a move on the next stage of our journey to Cirencester, a distance of about eighteen miles, over the worst bit of road we shall have on the journey. Bibury will be the only village of any consequence we shall pass through, and a very pretty little place it is, too, with the houses all on one side of the road and a river on the

other side, with a pleasant wall to sit upon or lounge upon as you like; with openings here and there, and steps for getting water from the stream. Just above the bridge, in the grounds of the inn, is a wonderful spring, which comes up in a beautiful, shady pool, with a volume of something like 6000 gallons an hour, which apparently never varies, and has never been known to freeze.

The church at the other end of the village is quaint and of an unusual plan. The road from here gradually improves in surface, and, as we near Cirencester, widens out into quite a fine highway, to narrow again somewhat as we enter the town only to expand again into a fine open market-place, with a really grand old church at the other end. With its fine perpendicular tower and two story south porch, the church asserts itself at once, and dominates the whole place, so that you cannot get away from it. There are old houses and other things here, but the church is above all the thing, and, inside and out, there is an air of opulence and good taste, things which are not always near relatives; they speak of the prosperity of Cirencester both in the present and the past.

This being market-day, the streets are rather too busy for the sketcher, and even the interior of the church is not so quiet as you would like it, for there is a boisterous party of young ladies, with one young man making a great noise and to-do over the rubbing of brasses. Then it came over dark and commenced to rain, so that one was compelled to abandon sketching. When the rain has ceased we move on again, feeling disappointed at not having done anything in a place that promised so well.

Now we wind our way over pleasant roads into the county of Wilts and the charming old town of Malmesbury, another dear old place of the Burford type, full of interest with its Norman abbey, its tower and its cross, to say nothing of its picturesque inns and houses.

What a place this grand old abbey must have been when William of Malmesbury lived and wrote here, and up to the time when the Butcher King dismantled and allowed it to be turned into a cloth factory. The market-cross, too, is a lovely bit of work, with a family likeness to the cross at Salisbury. If you feel inclined to eschew detail just for a change, and to prevent your hand from getting cramped, come down by the river which runs all round the base of the hill on which the town is built, and there, with the sunset glow behind the town, you have a picture worthy of your best endeavours.

Cross the river and up the hill and about ten miles of fair going will bring us into Chippenham, a town I think which need not detain us long; it has a nice balustrade to the bridge over which you enter, and a condensed milk factory which you pass as you leave.

An up-and-down road with a good surface over which we are, for once, tempted to scorch. We feel a bit done, but a refresher and a change at the Castle Hotel and we are fit to have another look round at the old familiar place, and pass our critical judgment on Brydon's extension of the Town Offices, and admit that on the whole we think it very successful.

We don't propose to sketch anything here, because it's been done so many times before, and we have back numbers full of it; but the "Castle" is a comfortable resting-place. The attack which we shall now have to make on the Mendip Hills will be better accomplished after a good breakfast in the early morning.

Crossing the river we leave the city by the road to the right; the left-hand road is the

way to Shepton Mallet, and a very bad road it is, hilly and uninteresting, whereas the right road, on which we are bound for Wells, runs through the most charming country imaginable, hilly, of course, but with lovely views at every turn. Chewton Mendip is reached in due course, and we begin to get a taste of true Somerset in the church tower, with its shafts and pinnacles—a beautiful bit, though very similar to some others we shall see further on. Sketch it by all means, it makes a pretty picture, crowning the village as it does, and backed by that dark belt of trees.

Wells must be our resting-place this night, for there is a deal to do in Wells, with its church, its bishop's moated palace and the rest, and if I confine myself to one sketch of the western towers, seen from the police station—you need not. The cloisters and the crypt and the High Street are all things worthy of your attention, and if you think of staying the night, there are numerous hotels to select from. I can recommend the "Swan," if you want to do the thing in style, and perhaps get some entertainment from the American and Colonial visitors, for this is a neighbourhood which attracts them.

A pleasant run of about six miles brings us to Glastonbury, with its famous ruined abbey, a grand and picturesque place, which, somehow, doesn't appeal to me—it seems so theatrical—as if it was built for a ruin; and as the A.A. have been here, and the pictures of it are legion, I will not add to them. The church, too, is fine, but would be much improved inside by the addition of a few painted windows. The Tudor front of the George Hotel is massive and worth study; I don't remember seeing anything quite like it before in hotel fronts.

From Glastonbury to Ilchester is a run through delightful country of about twelve miles, with charming "bits" for the pencil or brush at every turn. A thing that strikes you as you travel this country is the comparative plainness of the churches, built of Bath stone, to those erected with Ham Hill stone. Why it should be so I cannot think. One would have expected the contrary to be the case, seeing that the former stone is so much more workable.

Somerton, about half way between Glastonbury and Ilchester, is a jolly old place, with a quaint market cross and a hotel sign, which I should imagine to be unique. The Red Lion is the hostelry to which it belongs, and it takes Doric form and pedestal, with a sort of table on the top, which supports the most outrageously comical animal, of the "Leo shag baggy stuffies" order. What it is made of I do not know; but I do know that it is stuffed with straw, which is in evidence at various points, and that it has at some distant date been painted red. Somerton seemed to me a particularly dull town, but you are bound to laugh when you see that lion; and, by the way, another amusing feature I came across, which may or may not be characteristic, was the town crier and his assistant, the former a man of large proportions, with the usual bell, which he rang with vigour, while the assistant, a small boy of about ten summers, did the crying. It may be, of course, that town crying, as practised in Somerton, is an art requiring an apprenticeship, or that the crier had a bad cold. I do not know, but it seemed to accord well with the general lazy look of the place.

A massive but not otherwise very interesting church, a fine bridge, and one or two good

* This article is continued from page 84.

OLD TOLL HOUSE ON THE ILMINSTER ROAD.

stone-built houses of the early Renaissance period, are the principal features of Ilchester, and we may spend an hour or two here with pleasure and profit. Roger Bacon was born here, I believe, and it looks as if the place had been resting on its laurels ever since, though, doubtless, in the old days, when all the mills were going on the rivers Bruce and Parret which water this district, Ilchester was an important place. Whether the mill we shall pass as we near our journey's end at Ilminster (for it is hardly worth your while going on to Honiton unless you propose going further west to Exeter, for the road gets rather bad, and punctures are probabilities,) may be taken as a sample of what used to exist all along these rivers I cannot say, but if so they must have been some of the finest in the kingdom. This one burnt, alas, some years ago and never rebuilt is now a very fine ruin, and must have been a very fine mill indeed, built of stone entirely with gables and mullioned windows, and fed by at least a 20-horse power stream. The river, the pond, and all around and about this old place is delightful, but if you want to paint it or sketch it satisfactorily you must make up your mind to stay some hours at least; there is so much detail.

A very little place with a very big name is Whitelackington. Here we breathe the air of hygone days—metaphorically, of course—when even barns were considered worthy of thought, and taste was displayed in their erection; and the simple wooden gate, with its stone steps and brick piers, whereon we think we see a maiden, such as Marcus Stone has familiarized us with, and the smithy and the lodge yonder, all these we must carry away with us on the leaves of our sketch book, for each is a picture in itself and one well worth remembering.

Another mile and we are in Ilminster, where our journey ends.

A BLOCK of bathrooms and other accessories have been added to the workhouse infirmary at Ludlow. Mr. John Weale was the builder.

THE foundation stone of a new church in memory of Mr. Gladstone has been laid at Shotton, within the Hawarden Parish. The Gladstone family have contributed £1000 towards its endowment.

A CIRCULAR has been addressed by the Guardians of the St. Giles and St. George's Union to the various local authorities in London, urging united opposition to any expenditure of public money by the London County Council for the establishment, experimentally or otherwise, of a municipal opera house.

The Transformation of Holborn.

DR. JOHNSON'S remark, "Sir, let us take a walk down Fleet Street," is so hackneyed that it would be dangerous to repeat it but for the reflection that it would have been equally appropriate if applied to almost any other London street. For in this wonderful City of ours it is difficult to turn over a brick anywhere without stirring up history. Few things, says the Daily Telegraph, are more delightful to the man who knows his history than to saunter along one of its thoroughfares, letting his fancy rove at will, piercing the mists of remote times, and summoning for his pleasure the shades of those that in their day have played many parts. "Sirs, let us take

A WALK ALONG HOLBORN."

We will not trouble ourselves about the Holbourne, the Hollebourne, or Old Bourne, which some say did, and others did not, run a rapid course down the hill to the old River of Wells, afterwards degraded to the Fleet Ditch, and at length ingloriously buried as a public nuisance; and we will leave Celts and Romans, Saxon thanes and Danish vikings, Norman knights and English churls, all to their hard-earned rest. Let us dwell on the after times when our busy forefathers filled the place with story. How the old order changeth! It does not seem so very long ago—little more than a hundred years—when the bell of St. Sepulchre's tolled as some daredevil of the highway took the road for the last time, and received his nosegay at the church steps, with the father of "Scratching Fanny," the Cock Lane ghost, looking on, amid the yelling, cheering, cursing, and weeping of the mob; escorted thus, the cart lumbered up "The Heavy Hill" to the great gate of St. Giles's Hospital, where the sorry hero of the hour drank his last bowl of ale, and so on to "The Three-legged Mare" at Tyburn. In those days the Old Bell Inn, which was razed to the ground but yesterday, was a flourishing concern. Standing in

ITS OLD GALLERIED COURTYARD,

crazy and unsafe-looking, but delightful with its flavour of old time, it was easy to imagine the cheery tootle of the horn, the bustle and badinage, the fussing and fuming, the hurry and hallooing that accompanied the arrival or departure of the coach. The little statuette of Napoleon looked down on such a scene daily as the Bucks coach started, long after the advent of railroads. Now all is gone, and with it the last of the typical old coaching inns left to us in London. Great alterations are going forward in the near neighbourhood of the "Old Bell." Quaint old houses are coming down, very imposing ones are going up. Over the

way, about a half of the "Black Swan" Distillery has disappeared, and a new building, in all the glory of red brick and stone, has already taken its place.

HOLBORN WITHOUT FURNIVAL'S INN

is almost as difficult to conceive as St. Paul's Churchyard without the Cathedral, or Palace Yard without the Houses of Parliament. An inn of some sort has stood here since before the time of Richard II.—that is to say, for nearly six centuries—when Sir William Furnival, knight, had in Holborn two messuages and thirteen shops. Years after, when the male line of the Furnivals had died out, their heiress brought all this property as dowry to John Lord Talbot, who was created Earl of Shrewsbury by Henry VI. The original Furnival's Inn, the inn or town mansion of the Furnivals, seems to have been already leased to the Benchers of Lincoln's Inn for "a college for the gentlemen students or practisers of the law of Chancery," and thus it continued till early in the reign of Edward VI., when the then Earl sold it to the Benchers for the not very extravagant sum of £120. It ceased to be an inn of Chancery in 1818. At that time it was described as being "the most dirty and desolate of all the inns." Some of it—the hall and adjacent buildings—was as old as the Tudor times, but the front—"an uncommonly fine specimen of brickwork"—was the work of Inigo Jones. Messrs. Peto demolished the whole, and built that unbeautiful set of chambers—with a statue of Peto the Great in the quadrangle—which for the last week or two has been trying to look as much

LIKE A ROMAN RUIN

as possible. Next east to the Prudential Assurance offices stood, till the other day, Ridler's Hotel, once a famous old coaching house, the Bell and Crown Inn. Its courtyard, whence coaches for Dover, Stamford, and Banbury started, as well as the mails for Southampton and Louth, was built over long ago. Across the road, in very close proximity to the quaintest piece of domestic Architecture now left in London, we see the new Birkbeck buildings towering up, and driving out some old houses on the west side of Staple Inn and on the south side of Holborn, which, though nothing in themselves, occupy a site which has associations carrying us right back to the days when yet the Norman ruled in the land. For here was the first London church of the Knights Templars. They left it to fall to ruins when they took up their new abode between Fleet Street and the Thames in 1184. These ruins remained above ground for centuries, till the year 1595 in fact, and relics of them will probably be found in the course of excavation. Adjoining the Templars' Church was the Inn of the Bishops of Lincoln, built as early as 1147 by the then Bishop, and used by his successors till the time of Richard III. Later it was known as Southampton House, having become the property of the Earls of Southampton. Thus Southampton Buildings, built partly on its site in 1657, gets its name, while Southampton Row and Street perpetuate the new Southampton House, in what is now Bloomsbury Square.

A MURAL monument, costing £1400, is to be placed in St. Giles's Cathedral, Edinburgh, the birthplace of Louis Stevenson, in his honour. There is to be a medallion portrait of the famous novelist.

THE foundation stone of the new Union Chapel, Deanshanger, has been laid. Mr. J. Coker, of Wolverton, prepared plans for the new chapel, and the tender of Mr. A. P. Hawtin, of Northampton, was accepted.

IN the midst of the Hampton Park Estate, Swaythling, just outside the boundary of the Borough of Southampton and in the parish of South Stoneham, there has just been erected a new voluntary school. It accommodates 150 infants in an assembly hall and classroom, and has been built of red brickwork, with wood block floors. Mr. H. J. Weston, of Southampton, was the architect, and Messrs. Dyer and Sons, of Bevors Hill, in the same town, were the contractors.

RUINING THE RAMPARTS.

EXTENSIVE BARRACK BUILDING AT PLYMOUTH.

FOR a long time past the builder has been at work within those frowning ramparts which surround the barracks at Plymouth, and, indeed, upon the ramparts themselves—for on the eastern side huge gaps have been made in those massive walls, which were erected after the Restoration to terrify the people of Plymouth into subjection—and Plymouth Citadel as it has existed for centuries past will soon have

NOTHING BUT ITS ENTRANCE GATES

and its written history to tell of its former glory. The barracks proper are gradually being torn down, and new and more commodious buildings erected on the sites. One new block, comprising the officers' quarters, has already been practically completed. On the site of an old magazine which overlooked Plymouth Sound a three-storied building has been put up, plain, but substantial and imposing in appearance. It is constructed of local limestone, and this with Portland dressing needs little artificial embellishment. The accommodation is up-to-date. Though this is the only new building which is complete, other

WORKS OF AN EXTENSIVE CHARACTER

are being carried on under Mr. H. Kerswill, contractor, and Mr. Saunders, acting on behalf of the war authorities, as clerk of the works. The officers' old quarters, together with most of the eastern rampart wall, have been demolished, and accommodation for 250 single men, together with a very large recreation block, are being built. The material found in

the solid old rampart wall is being re-used for the interior of the new structure, and the facings are in character with those of the officers' block. The main building, which is to include reading, billiards, coffee, and recreation rooms, has a frontage to the west of something like 350ft., and a depth of 26ft., and projecting from each end of this extensive structure, at right angles with it, will be barrack rooms. These will be sixteen in number, and 44ft. by 21ft. each in size. The main building, as well as the projections, will contain two stories, and immediately in front of the central entrance will stand the statue of George II., now temporarily encased in a wooden frame. Though rapid progress has been made with the work, it will not be finished for some months to come. Other extensive improvements are contemplated. In fact, sooner or later nearly all the old buildings will be superseded by those of more modern design, and if future work is carried out on the same architectural principles as those already in hand, the Citadel barracks will, in a few years time, be amongst the best in the country. Though further portions of the ramparts will have to be demolished in order to make room for much-needed improvements, it is satisfactory to learn that those facing the eastern end of the Hoe, and which give such an old-world aspect to the locality, are not likely to be disturbed.

THE Curfew Tower bells at Windsor Castle, which are rung upon the birthdays of the Queen and Royal family, and have been silent for a time, owing to the fall of the big tenor and the discovery of a crack in the fifth bell, were successfully pealed last week for the first time since their rearrangement.

GREAT ART WORKERS OF THE CENTURIES.

SIR CHRISTOPHER WREN : ARCHITECT.

ARCHITECTURE may perhaps fairly claim to be the noblest, as it was certainly the first, of human arts. Every era of the world's history has left us examples, many of them stupendous or magnificent, of the builders' skill. That marvellous early race which inhabited the Nile Valley from the period of shadowy myths and fables, have left the enormous pyramids and colossal temples. Modern research has brought to light the architectural remains of another race as ancient, and has disinterred from the desert sands more or less of those earliest cities founded on the Chaldean plains by Nimrod, that "mighty hunter before the Lord." Classic Greece has bequeathed to us the remains of edifices of ideal beauty in the ruins of the Parthenon and other fair temples; and Rome, albeit less delicately refined, has left more glorious structures, and to her architects is due, if not the invention, at any rate the first practicable construction of domes. All through the Middle Ages lovely Gothic edifices

"ROSE LIKE AN EXHALATION"

throughout Europe, and finally the Revival period gave the world the great artist of whom I am about to treat. Sir Christopher Wren, only son of Dr. Christopher Wren, was born at East Knoyle, in Wiltshire, in October, 1632. In consequence of his delicate health, his early education was given him at home by a private tutor. Subsequently he passed on to Westminster School, then under the head master-

AN ARCHITECT'S HOLIDAY ON A BICYCLE. OLD HOUSES AT BANBURY. SKETCHED BY E. W. SAMPSON.

MONUMENT IN BURFORD CH.

ship of Dr. Busby. As is well known, he early showed a special genius for mathematics, and on that account he was placed before long under the care of Dr. William Holden, a learned man of considerable and diverse talents. The early bend of Wren's mind took a practical form in the invention of numbers of machines and instruments for the purposes of astronomy, agriculture, and many other sciences. Indeed, there seems to have been no subject of any kind occupying the attention of scientific men of his time in which Wren was not listened to with attention, or in which he did not distinguish himself. He made a special study of gnomonics, or the science of dialling, at that time a most important subject of investigation, and developed the subject in many directions. Among other things he made a wonderful set of models showing the actions of the muscles of the human body, for Dr. Scarborough, which were, unfortunately, destroyed in the Great Fire. His mind was most versatile and comprehensive, and his inventions and treatises embraced all conceivable subjects, from "Improved Methods of Whale Fishing" to "Sham Marble Pavements," including "Cheap Bed Hangings," and, as a matter of course, "Perpetual Motion." He also made some valuable suggestions for the establishment and conduct of a kind of meteorological office for collecting statistics of natural phenomena, with a view to the amelioration thereby of the condition of mankind. It is held by some that Wren invented the barometer, but this seems a little doubtful. He made many

IMPORTANT DEVELOPMENTS

of the idea, however. In the year 1646, at the age of fourteen, Wren was admitted at Wadham College, Oxford, as a gentleman commoner. In 1650, when he was eighteen years of age, he received the degree of B.A. at Wadham College, in 1653, that of M.A., and was elected in the same year to a Fellowship of All Souls. In 1657 he became Professor of Astronomy at Gresham College, London, and in 1660 Savilian Professor at Oxford. He received his degree of Doctor of Civil Law at Oxford in 1661, and in 1680 he was elected President of the Royal Society. This society took its origin in some informal meetings of a few friends interested in similar subjects, amongst whom Wren soon took a foremost position. When the suggestion was made to organise a society of a definite nature, and for a settled purpose, Wren took up the idea with great vigour, and drafted the charter under which the society was established. It would appear that Wren's first architectural work was the building of a chapel at Pembroke Hall, Cambridge, for his

Uncle, Bishop Wren, of Ely. The Bishop had been imprisoned for eighteen years in the Tower for High Church practices, and on his liberation he erected this building as a thank-offering. The first stone was laid May 13th, 1663, Wren being then thirty-one years of age. The building has been restored by Scott, who added 20ft. to its length. Apparently the same year (1663) Wren's name was put upon the list of the Commissioners for the repair of St. Paul's Cathedral. Various schemes and arrangements were discussed in connection therewith, but nothing particular was done until the beginning of the year 1666—the year of the Great Fire—when Wren drew up a report and sketched out his ideas for a restoration. The plan was to Romanize the nave, the Norman arches of which seemed to him to lend themselves easily to this treatment, and to build an immense domed rotunda at the crossing, cutting off the outside angles for this purpose. The plans and estimates for this work were ordered on August 27th, 1666, but six days later the Great Fire brought the labours of this commission to a close, by destroying the object of their consideration. It was in the preceding year (Midsummer, 1665) that Wren made a journey abroad, about the only time, it is believed, that he left England. The country he visited was France, and he spent most of his time in Paris, where

THE GREAT PALACE OF THE LOUVRE

was recently commenced. He was much struck with Bernini's design, and indeed stated that he would have given his skin to possess it. The cautious old Italian, however, only allowed him a rapid inspection of the drawings, and would not permit him to copy them. Wren visited most of the palaces and villas of any importance in France, although the influence of French work is not very apparent in his own designs. He never, however, went to Italy. Wren returned from France some months before the Plague ended, and applied himself, with other members of the Royal Society, to a careful study of the disease and its remedies with a view to exterminating the enemy. The Great Fire, however, accomplished this for them in a far more summary and complete manner than they ever dreamt of, and Wren's thoughts were turned at once in quite a new direction. The King set him to work immediately on the Cathedral, which was to be demolished and rebuilt. The first design produced, after much preliminary discussion and planning, was a church on a thoroughly classical model, consisting of little more than a great dome with surrounding aisle and entrances. Wren was so pleased with this production that he made a large model of it for the benefit of the uninitiated. A controversy naturally started at once upon the merits of this plan, and waxed exceeding fierce. Many of the members of the Chapter preferred to have a building on a more orthodox plan, after the fashion of their existing Gothic cathedrals. The opinion of these worthies finally outweighed that of their colleagues, and the architect set to work again on new lines, and produced a design more curious than beautiful, combining central spire and dome in one composition. The King discovered this design to be "very essential, proper, and useful," and gave his Royal assent to it, and ordered the building to be proceeded with forthwith. The Royal assent is dated May 1, 1675. Fortunately, the King gave Wren the liberty "in the production of his work to make some variations, rather ornamental than essential, as from time to time he should see proper," a permission which he interpreted in the most liberal manner possible, for the Cathedral, when completed, was no more like this design than its predecessor.

THE PULLING DOWN THE OLD WORK,

preparatory to rebuilding, was a long and difficult job. The mighty tower of the old Cathedral, 200ft. high, and with piers 14ft. in thickness, seemed such a formidable object to demolish that Wren resorted to the expedient of blowing away one of the piers with gunpowder, a process that was at once simple and effectual. To those who meditate operations of this sort, it will be interesting to learn that only 18lb. of gunpowder were necessary for the

carrying out of such an undertaking. Another explosion indulged in in Wren's absence having been attended with disastrous consequences, the remainder of the building was gently battered down with an enormous battering ram, "after a good Roman manner." On exploring the soil for foundations, Wren found that the old church had stood on a layer of hard and close pot earth, about 6ft. thick. Under this was loose, dry sand, which poured out like a fluid when excavated into, and below this again, at low-water mark, water and sand, mixed with shells; while under this was a hard, firm beach, with the solid London clay below it. It appeared that the site had once been part of a wide estuary, along which, when dry, the wind had driven the sand, and made the hill on which the Cathedral stands, the pot earth being simply the finest of the sand, which had naturally found its way to the top. At the north-east angle of the choir the pot earth had all been taken out and used by the potters of old time, and so here Wren had to run down a 10ft. pier to the hard beach 40ft. below, and from this he turned an arch which carries this corner of the building. Very little information is given in the "Parentalia" respecting the erection of the Cathedral, but fortunately we have the building before us, just as Wren left it to examine for ourselves. A fault often found with the exterior is the carrying up of the aisle walls far above the roof to hide the buttresses which support the nave vault. This was, however, the result of a choice of evils, and it has been managed so skilfully that a critic must be very hard-hearted who lays much stress upon it. As for the question of the double dome—the exterior being so much higher than the interior—this is no worse than the use of a tall spire as the roof for a low tower. No power on earth could devise a dome—unless an isolated one—that should look well both inside and out without resorting to some such expedient. The chief faults found with the interior are, in the

BREAKING OF THE ARCHES

into the frieze of the main entablature, and in starting the arches of the vaulting from an attic order instead of directly off the cornice. With regard to the first of these objections it is a misfortune and an unnecessary one. The effect of the frieze broken up into shorts bits over the pilasters only is most uncomfortable and unsatisfactory. Wren defended this arrangement himself with more or less ingenuity, but he would have done better by making frieze and architrave run boldly along over everything. It is obvious, at first sight, that Wren was a product of the Renaissance. The same reaction against Gothic Architecture, and in favour of revived Classic forms, which had taken place in Italy reached the shores of Great Britain later on. Inigo Jones, a man of mark during the reign of the first James, was doubtless the first English architect who was distinctly affiliated to the Renaissance, being, as he was, a student of the Italian Palladio. Much of Jones's work was in brick—as, for instance, the so-called Holbein Gateway—and has passed away. The Banqueting House, Whitehall (now used as a Museum for the Royal United Service Institution), is the only adequate example of Jones's ability which we have, and it must be owned that it is an excessively fine one, and well worthy of the immortal predecessor's of Wren. Sir Christopher's work as an architect was, from peculiar circumstances, mainly of an ecclesiastical character. The glorious Gothic minster dedicated to the patron saint of London—St. Paul—and a great number of City churches had vanished before that fearful deluge of flame which rolled unchecked over the metropolis from east to west. All these had to be re-edified as the city arose from her ashes, and Wren was appealed to for designs. Hence he was the architect of most of the City churches of any antiquity.

W. N. B.

A new wing has been added to the South Devon and Cornwall Blind Institution. The wing, which is built in harmony with the rest of the building, is faced on the exterior with Plymouth limestone and Ham Hill stone dressings. Mr. H. J. Snell was the architect.

FOUNTAIN'S ABBEY.

THE members of the Yorkshire Archæological Society visited Fountain's Abbey last week. Fountain's Abbey, as is well known, originated in a small body of Benedictine monks from St. Mary's Abbey, York, who desired to obey the rule of St. Benedict more strictly than it was practised there. Being compelled to leave their own abbey through the opposition of their brethren, they were received by Archbishop Thurstan, who bestowed upon them, in 1132, the site of the Abbey of Fountains. The first buildings were mere huts, but the advent of the Dean of York, and of two of the canons, who joined the little community, enabled permanent structures in stone to be begun, probably in 1135. The buildings were laid out on the normal Cistercian plan, and it is not unlikely that they were begun under the direction of Geoffrey, a monk of Clairvaux, who came over to Fountains to teach the brethren the Cistercian rules. Mr. St. John Hope pointed out that the Cistercian order differed from other orders of monks in the division of its communities into monks, who were residents, for the choir services, and the gentlemen who were called in the statues the "conversi," the working brothers, who were not bound to attend

all the services, and who were responsible for the outdoor work on the farms, &c. In all the Cistercian abbeys, especially those founded in the twelfth century, the whole of the buildings were broken up into two great sections, one for the accommodation of each of those sets of men. This fact explained a good deal in the arrangement of the buildings, which otherwise was not understandable. Another interesting fact about the church was that it was quite evident from existing remains that the whole of those early arrangements, or divisions, were entirely swept away at the beginning of the sixteenth century. It all belonged to a rather remarkable story that had still to be properly unravelled, and which pointed to the original division of the monastery that had been departed from. As a matter of fact, he had not been able to find any trace of the existence of those "conversi" after the date of the Black Death in 1349 in this country, though they still continued to exist abroad. Attention was called to the admirable work by which portions of the building had been erected over the River Skell by means of piers and arches. In the case of the infirmary, the whole establishment had been built upon a raised platform carried by four parallel tunnels, through which the river runs. The works of Abbot John of York (1203-1211), Abbot John of Kent (1220-1247), Abbot John Darnton (1479-1494), and Marmaduke Huby (1494-1526) were dealt with.

EFFINGHAM HOUSE,
Arundel Street, Strand,
London, W.C.

The Yorkshire Foresters' Orphanage and Convalescent Home.

THESE drawings illustrate the selected design for the building to be erected on the site acquired by the Yorkshire Foresters at Bridlington for their orphanage and convalescent home.

The plan is symmetrically arranged and adapted for sub-division of the sexes, and general supervision by the matron; also for abundance of light and air throughout.

The kitchen department is placed entirely in the back addition, and cut off by folding doors from the main block.

A staircase is provided at front and back of building, easily accessible in case of panic.

Lavatories, w.c.'s, and bathrooms (with hot and cold water laid on), are placed in suitable positions, and will have fittings of the most approved type.

The funds at disposal not permitting, at present, for a general dining hall, this has been partially provided for in the future by carrying a portion of the upper floor (where space was absolutely requisite) on piers and arches, thus enabling a complete room to be obtained at a small additional outlay.

The ventilation has been carefully considered, fresh air inlets being provided, and exhaust ventilators on roofs and in chimney-breasts of each room.

The walls externally are to be faced with Lincolnshire red bricks, and have brown Whitby stone dressings.

The corridors, &c. of the ground floor are to be laid with tiles, and the rooms with wood blocks; roofs to be boarded and felted under slates. The internal joinery is to be mainly of pitch pine, varnished.

The author of the design, which was selected in open competition, is Mr. Robt. J. Beale, A.R.I.B.A., of 9, Victoria Street, Westminster, and he has received instructions to obtain tenders for the erection at an early date.

THE plans have just been accepted for a new church at High Park, Southport, to replace the Ebenezer Independent Church.

At Middlesbrough the Archbishop of York has dedicated the former Prince of Wales's Theatre in the town as a mission chapel. Some time ago the music-hall was bought for £3500. One thousand pounds was expended on the alterations, and £150 in furnishing.

SOME process of dismantlement of the interior of St. John's Church and St. George's Church, Liverpool, fabrics which are now in the hands of the Corporation, is now going on, but no sign is as yet apparent of Corporation intentions concerning the structures themselves. There is a conflict of opinion touching the fate of St. George's. Shall it be left standing and utilised for public purposes, or shall it be razed and an open space created?

THE YORKSHIRE FORESTERS' ORPHANAGE AND CONVALESCENT HOME, BRIDLINGTON:
FRONT ELEVATION. R. J. BEALE, A.R.I.B.A., ARCHITECT.

NEW POLICE STATION AT HUDDERSFIELD.

THE new Central Police-station and offices, which have been erected at Huddersfield, at a cost of £12,000, were opened last week. The old police-station was out of date, as the following lines, inscribed on a rough slab at the rear of the station, indicate: "This house and prison, erected Anno Domini, 1831, at an expense of £ —, viz., by loan from Sir John Ramsden, Bart., of £300, and a public subscription of £ —. Joseph Beaumont, Constable." In those days, apparently, the erection of a police-station was assisted by voluntary subscriptions from the public, although the amount collected from the Huddersfield public of 1831 is discreetly left blank on the inscription. Judging from the general meagreness and unhappy character of the building, the public subscription was not remarkably large, and the result was that as the force grew in numbers the accommodation became terribly cramped. A removal will now be made to more capacious and handsome quarters. The site of the new station is prominent, and, what is of great importance, convenient. Its chief frontage is to Peel Street, along which runs one side of the Town Hall. The Fire Station is immediately adjoining, and the Borough Court-house is connected with the station by a subway. There is about the new station none of the structural grandeur that characterises the Town Hall, and which seems to overwhelm its new neighbour. The offices are two stories in height. The designs were prepared by Mr. Dugdale, the late borough surveyor. It is after the English Masons' style, and among the important buildings at Huddersfield it is of altogether a distinct type. The carving is not elaborate, but the main front entry is noticeable. The work was commenced in October of 1896, so that the

station has taken practically two years to complete. Probably it would have left the contractors' hands ere this but for a long interruption caused by a strike among the masons. For a greater part of the time the work has been overlooked by the new borough surveyor, Mr. K. F. Campbell, M.I.C.E. The main entrance from Peel Street leads into a central hall, conducting to the various departments. On the lower ground floor there are six women's cells, mortuary, post-mortem room, parade room, living rooms for caretaker, search office, store and photographing rooms, charge office, documents store room, and stolen property room. From this department is the subway into the court-house at the Town Hall, which must be found convenient for conducting prisoners. On the floor above are nine cells for men, detention solicitors' room, chief clerk's office, inquiry office, superintendent's office, chief constable's private office and retiring room, the chief detective's and detectives' offices, warrant office, muster day-room, all fitted with modern lavatory arrangements. At the rear of the building is a billiard room for the men. On the top floor over the yard is a large parade room over 80ft. in length, and access is given from this to the parade ground. Mr. Alf. Schofield, of Huddersfield, has had charge of the masonry work since the foundation stone was laid, and the joinery has been in the hands of Mr. Henry Holland, of Huddersfield. The plumbing work has been done by Mr. Thos. Armitage, plastering by Mr. W. E. Jowett, slating by Mr. T. B. Tunnacliffe, ironwork by Messrs. Dorman, Long, and Co., and F. Milan and Co.; carving by Messrs. Thewlis and Co., of Leeds; concreting by Mr. John Cook, of Huddersfield; painting by Mr. W. P. Holroyd, of Huddersfield; the furnishings by Messrs. Hobson and Son, of Huddersfield; and the electric lighting by Messrs. Read, Holliday, and Co.

R. J. BEALE, A.R.I.B.A., ARCHITECT.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

September 21st, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

POPE LEO XIII. has designed his own tomb. The plans for this elaborate piece of work were finished by His Holiness only a few weeks ago, and are now in the hands of the Vatican architect. The Pope has expressed the wish that after his death his remains shall be placed in the tomb which he has now designed in the Church of St. John Lateran, at Rome. The Pope has selected the exact spot in the Church of St. John Lateran where this tomb is to be erected. Above the door of the vault is to be a recumbent figure of the Pope in marble. The entire arch is to be constructed of the finest marbles, and the door will be of the heaviest bronze. Those who have seen the designs which the Pope has approved say that they show great taste and much architectural skill.

THE Post Office authorities are carrying into effect a large scheme which has been approved for efficiently coping with the increasing work in the metropolis. The east block of the General Post Office is to be pulled down except the eastern walls, and a new structure will be erected in its place. A new wing is also to be added to the City offices in Mount Pleasant. A block of commercial premises contiguous to St. Martin's-le-Grand has been purchased by the department. This is to be demolished, and on the site a handsome and commodious building is to be erected for the use of the large staff of telegraph clerks as dining and cloak rooms. The cost of the scheme will be about £200,000. The department also intends to build a new post and telegraph office in the East Strand when a proper site can be secured, as the present office, which is not able to meet the demands of the time, will shortly have to be given up, when the lease expires.

FAR from becoming obsolete, windmills are springing up afresh in various parts of the country, and are being found of very great value for maintaining a water supply in out-of-the-way places. Lord Spencer has several at work on his Northamptonshire estate, and by their agency two villages are supplied with water. Of course a windmill will only work when there is a wind blowing, but it is surprising how constantly there is blowing a wind sufficient to keep it in operation. It is found that a mill can be kept at work on an average for 1432 hours a day throughout the year. It works slowly but persistently.

VERY few of the cosy and picturesque old taverns that once dotted the London suburbs are now left, and the few that remain are probably all doomed to early demolition.

Times change—very rapidly nowadays; old manners go, and taverns, like other things, must be brought up to date, or they do not pay—at least, not so well as they might do. The situation of the Greyhound might have saved it a few years longer; No. 1, Kensington Square, really the south end of Young Street, is so placed that it presents one of those remarkable contrasts so often found in London—an oasis of quiet in the midst of babel.

KENSINGTON HIGH STREET is very much alive and very wide awake. Kensington Square is always much more than half asleep. As for Young Street, very few Londoners, even in Kensington, have ever heard of it. It is just the place, above all others, for a quiet, eminently respectable, well mellowed, red-brick old tavern like the Greyhound to be found in; and now comes the news that it is to be rebuilt on a more ambitious scale. Just over the way, at No. 16, lived Thackeray, and in this double-fronted, bow-windowed house he wrote "Vanity Fair." Macaulay is said to have been a visitor here, and, in earlier times, Pope, when staying at Holland House. The Greyhound is said to be about 350 years old, but we may knock off about 160 years of this without doing any great damage to probability. It presents all the features of those plain, substantial, roomy, and comfortable domestic buildings, free from all architectural affectation, which began to rise up in the latter part of the seventeenth century, and continued to be built, with very little departure from the early type, until nearly the end of the following century.

THAT Glover's Island should be preserved for the public, at least to the extent that it shall not be disfigured by any hideous building or hoarding, must be the ardent wish of everyone who has enjoyed the superb view from the Terrace at Richmond. The mere suggestion of its profanation, it might have been thought, would have brought forward the public open-handed with subscriptions for its rescue; but as we have already noted, an appeal for £4000 has met with a response to the extent of £50 only. From this it must not be assumed that the people of Richmond are careless of the beauties of their town and its surroundings. Their objection is the very natural and proper one that £4000 is a preposterous price to pay for a property which was purchased in 1872 for £70, and is now rated at £18 a year.

It is not as though this were the only spot in the neighbourhood of London in need of rescue. Appeals for money, either by grants from public funds or in the way of public subscription, for the purpose of preserving the natural beauties and open spaces of Greater London are, the Globe observes, becoming more frequent year by year, and the tendency is for prices to go up. As a rule, the public are prepared to make considerable sacrifices rather than allow of the encroachments of the builder upon these spots, and this in itself does not make for cheapness. With regard to the threats usually held out in these cases that a scene of great beauty will be made hideous with hoardings, a very simple remedy might be found in suiting bye-laws to the occasion. With respect to ordinary buildings, such a device might be more difficult of application; but in any case it is time to consider how far it is wise to encourage future excessive demands by refraining from a rigid economy in the cases before us.

THE anticipations of the importance of the great Rembrandt Exhibition at Amsterdam seem to have been fully realised. A wonderful display of the work of the master, drawn from nearly all the chief European collections, has been arranged, and something which adequately represents the achievement of his busy life is now available. As many as 123 of his pictures and 200 of his drawings are hung in the Town Museum, and with them are shown the 400 photogravures, the property of M. Sedelmeyer, which were prepared for Dr. Bode's authoritative book on Rembrandt. Every stage of his development is illustrated, but the show is strongest in the productions of his later period,

when his superb technical powers reached their fullest maturity, and his position as one of the greatest masters in the world of Art became unassailable.

ABOUT a third of the collection, forty pictures and a large number of the drawings, have been lent by British owners. The Queen contributes "The Lady with the Fan" and "Rembrandt and Saskia;" the Duke of Westminster five pictures, and the Dukes of Devonshire, Buccleuch, and Portland, six between them. Some characteristic, but comparatively unknown, canvases come from Russia and Poland; and from the public galleries of Holland and Germany much of the utmost importance has been selected. Even the famous "Night Watch" and "The Syndics" have been removed from their permanent resting place to add to the glories of this exhibition. America alone is unrepresented, but as the examples of the master that have found their way there are, with few exceptions, not his finest works, there is in this fact less cause for regret than might have been expected.

THE Birmingham Art Gallery has opened with a show of some of the French pictures that made the exhibition at the Guildhall so attractive last season. Alexandre Dumas used to say that an author became a classic when he was translated into another language, and a painter becomes almost an old master when he lives to see his work famous outside his own country. Some of these pictures are already old masters—such as Meissonier's "Friedland," Benjamin Constant's "Pastime of the Kalifa," and Jules Breton's "First Communion," and, above all, Gerome's "Death of Marshal Ney."

It is these classical masters of the modern French school that will make the finest show at Birmingham, but amongst the forty pictures that have been selected for exhibition there are also works of the Barbizon painters, landscapes of Corot and Daubigny, the Harpignies canvas that was rejected by the Royal Academy last year, one or two works of Courbet, interesting rather than excellent, a portrait by Bastien Le Page, and small canvases of Isabey and Delaroche. This catholicity of Art appreciation, wisely shown by our own Guildhall Committee, finds its echo in Birmingham, and cannot but do good. It was the exhibition of a few Barbizon pictures not many years ago at Glasgow that gave rise to the new Scotch school which has exercised so large an influence on English modern Art.

THE erection of a Naval College at Dartmouth for the training of cadets has been in contemplation for a long time. Several years have elapsed since Mr. Goschen announced in the House of Commons that the cadet training-ship Britannia would be abolished, and would be succeeded by a college on shore. It was not at first announced that the college would be at Dartmouth, and for a long time there was a "battle of sites." Residents on the East Coast and people interested in Portsmouth claimed that their particular localities could furnish the best site for a college. But the Government kept their eyes on Dartmouth. The situation of the Britannia there had always been a success, and had afforded the cadets that large amount of freedom which would be impossible near a more populous place. After the Government had decided on Dartmouth as the site for the college, other difficulties arose, this time connected with the purchase of the necessary land. The owners refused to sell, and eventually, after the First Lord of the Admiralty had been over the site, proceedings were taken in the High Court, and the purchase of a portion of the Raleigh Estate was definitely concluded.

THE Admiralty had at this time prepared plans for a college, but they were abandoned, and Mr. Aston Webb was commissioned to prepare plans. These have been completed, and have received the approval of the Admiralty. The perspective view shows a handsome pile of buildings. The buildings will extend in one straight line. There will be an

imposing central block, with clock tower, and wings on either side, the range of buildings terminating at both ends in smaller towers. There will be three floors. In front there will be a terrace, the portion in front of the central block resting on ornamental arches. The grounds in front are to be laid out with great care and taste. The hospital is to be on a very elaborate plan. This building will be erected first. Altogether the plans show a very solid, fine block of buildings, without any very great expenditure upon ornamentation. An early start will be made with the work. Already Mr. H. C. Goss is building a caretaker's lodge, and next week Mr. Milner will commence laying out the grounds. It is expected that the building of the college will occupy about four years.

A RUMOUR comes from Paris that a serious disaster has occurred at the Bibliothèque Nationale. A splendid collection of rare etchings and prints is housed there, and many of the finest examples are shown framed under glass. It has just been discovered that serious injury has been caused to these by the heat of the sun to which they are exposed, and by the gathering of moisture inside the glass; and an attempt to remedy the mischief has led to the destruction of many unique treasures. For the future the finest things, whether engravings, drawings, or manuscripts, will not be hung on the walls, but be carefully protected in portfolios.

THE Church of St. Katherine Coleman, Fenchurch Street, E.C., possesses many old associations which cannot fail to prove interesting to all lovers of the history of the old City. The church has recently been under repair, and a great improvement has been effected in the interior of the sacred edifice. Stained glass windows will shortly replace the present plain ones, the designs having already been prepared by Mr. Soames. The work, which is estimated to cost about £120, has been entrusted to Messrs. Turnbull and Son, 4, Northumberland Alley. The year of the foundation of the original church remains uncertain, but the first record of the appointment of a rector dates as far back as 1346. It was dedicated to St. Katherine of Alexandria, a beautiful virgin, descended from the son of the Roman Emperor Constantius and the daughter of the King of Cyprus. She suffered martyrdom for the Christian faith, and was beheaded by command of the Emperor Maximian about the year 310. The name Coleman was added on account of its standing near a great garden belonging to one Coleman. This garden was at one time part of the grounds attached to the Priory of Holy Trinity. The old building escaped the Great Fire of London, but was pulled down in 1734, and was shortly afterwards rebuilt at a cost of about £3500. The older monuments—one bearing date 1553, and another 1577—are situated in the porch under the tower; the most elaborate is to the memory of Lady Heigham, who died in 1634.

MR. EDWIN DREW writes to The Times from 37, Caversham Road, N.W., September 12th: "A recent visit to Shakespeare's house and Ann Hathaway's cottage has convinced me of two dangers in connection therewith. I was informed officially in Shakespeare's birth room that the hot-water pipes in winter are so affecting the plaster that it peels off, and owing to this the signatures of Tennyson and Dickens have disappeared. Among the mass of names on walls and ceiling are many which add an interest even to the overwhelming halo of Shakespearian memories, and these great names are a record in themselves. Yet they must disappear without further protection. Could not the walls and ceiling be encased in glass to preserve the names and stop the peeling? At the Hathaway cottage—a thatched home with much woodwork—I found a good coal fire burning, and near was dry wood, only too inflammable. A spark would set the place alight, and it would be in ashes in a few minutes. I saw no adequate means to check fire. As the cottage belongs to us all, should not its protection concern us? I do not think

any fire should be allowed in it, and the excellent inmates should live in a house near. I am not interfering, but speaking in the universal sense."

A FRENCH scientist has recently discovered an inexpensive, and therefore highly remunerative, way of permanently fixing spectral colours. The objects upon which the colours are fastened are thin sheets of waterproof paper, polished glass plates, or thin boards, which are placed in a dish and covered with water. On the bottom of the dish there are a number of very small openings governed by a stop-cock, enabling the operator to let off the water slowly and evenly. After the water has settled in the dish a few drops are added of a solution of asphalt, bitumen, or a similar material, which is separated from the water in an insoluble shape by the action of air and light. When the essence has covered the surface of the water it forms a very thin film, and vibrations of the air produced by whistling across the surface of the film are transferred upon the thin film, bringing forth a series of colour combinations, each of which corresponds to a given sound. After a short time the medium wherein the bitumen has been dissolved evaporates, and as the first small wrinkles appear in the film the stop-cock is opened and the water is allowed to flow off slowly. The film sinks evenly upon the surface which is to be coloured. Finally the sheet of paper or glass is dried, and the result is the appearance of wonderfully beautiful iridescent colouring on the surface.

At a recent meeting of the City Council of Wells, Somerset, tenders for the building of a new Town Hall and post-office were opened. There were six tenders, the highest being £10,696, and the lowest £9192 10s. The architect's estimate was £4850, so that the prices read out caused very great surprise. None of the tenders were adopted, and the whole question was referred to a special meeting of the General Purposes Committee.

It is nearly a year since Mr. Hughes, of Dublin, a very talented young Irish sculptor, finished a beautiful statue of Charles Kickham, the well-known Irish novelist and Fenian convict. A site was obtained for it in the town of Tipperary, and it was duly sent to the spot, but, as a correspondent to a local paper complains, was relegated to the obscurity of an outhouse, where it still remains. This is not creditable to Tipperary, or to Ireland, and the committee should bestir themselves.

MR. A. G. MUNRO, of Porthleven, writes:—"We have already an excellent association for the preservation of ancient and historical buildings, but who shall prevent for us the erection of unsuitable dwellings on ancient and classic spots? Some time since I was much struck with a brand new building of the latter type overlooking Abbotsford on the other side of the Tweed. Poor Professor Blackie is happily spared the pain of beholding a glaring white object, conspicuous over all Mounts Bay, on the rocks towering above his much-beloved Mullion Cove. This is the up-to-date substitute for 'the good old house and the good old inn, that's kept by Mary Munday,' of the Professor's popular Cornish poem. But what words are adequate to deal with the latest venture near the site of Arthur's Castle, in North Cornwall, where a modern up-to-date hotel, fitted with electricity, all the latest contrivances, &c., and modelled after the original design of Arthur's habitation is promised us? If this kind of thing is tolerated, Cornwall will soon lose that strange charm of far-offness and old-world romance which has so greatly fascinated until now."

MISFORTUNE seems to follow the building of the new offices of the Public Health Department in Basinghall Street. As a building it will ever remain an architectural contortion, and therefore a structural eyesore. The best has, however, been made of a very bad job. The new offices are but shadows of what they were originally intended to be, and they will

not be habitable until late in the autumn. A new difficulty has now arisen, namely, the flooding of the lower portion of the building. No one knows exactly where the water comes from. The process of pumping it out has been in operation for several days, and it may be difficult to keep the place clear of water. If this is so a very serious question arises, as the foundations are likely to suffer. Under any circumstances, the whole history of the undertaking has been one of disappointment and needless expense.

THE School of Art Wood Carving, by migrating to the Imperial Institute, points the way in which the usefulness of that rather unfortunate building might be made apparent. In the ranges of rooms which are not needed for any of the purposes for which the Institute is supposed to exist, space could be found for many more classes of the same type; and in time the place might well develop into a great technical college and workshop, and play a part of much value in modern practical education. It is well situated in the immediate neighbourhood of the museum; and it would have the advantage of being easy of access for students from all parts.

NEXT year's excursionists may find, alas! that there is one Kentish paradise the less to gratify their artistic and Bohemian tastes. Visitors to Tunbridge Wells from all parts of England need not be told that the famous woodland retreat of Southborough Common is one of the most lovely picnic centres in southern England. For picturesque position and surroundings the common is hard to beat. Situate four miles from Tunbridge Wells, just off the old coach road, leading from West Kent to London, and replete with all the sheltered variations of rare forest scenery, not only English artists but many foreign visitors have found it most enchanting, and have gone away to circulate the story of its charms. A fine old fane nestles in the depths of the glade on the north-west side of the village, which has virtually in recent years become a suburb of Tunbridge Wells. But the eye of the spoiler is fixed with hungry gaze on this playground of the people. The local burial board impatiently waits to turn it over to the gravedigger and make it a place of graves. Public opposition has been already aroused, and medical men, town councillors from Tunbridge Wells, the Social Democrats, the tender Fabians, and even the pro-parsonic organist of the place, are for once unitedly boiling over with wrath at the proposed woodland spoliation, and it is hoped that this popular wrath may not be too easily exhausted.

FOUR of the six sculptured panels which are intended to carry on the allegorical story begun a few years ago by Mr. Stirling-Lee, have been fixed in the noble eastern front of St. George's Hall, Liverpool, and the other two will be in position shortly. The hint may be given that the lettered inscriptions which have been cut into the wall beneath the earlier panels should be brought into higher relief. At present these cannot be read, and so the story of the sculpture is lost to the general public.

THE Vicar of Sledmore writes:—"Sir Tatton Sykes, having spent some thousands of pounds in church building, maintains that he has a right to make what changes or alterations he thinks fit. To effect this purpose here he has had keys made to the various doors of the church, and having before the consecration removed a large rood and the screens from the side altars, has since sent persons into the church and further taken away a cross, candlesticks, several altar cloths, and a quantity of seats, with a view, as he says, to simplicity, he having completely changed his ideas on churches since the work was finished. One reason for stripping a side altar is that the slab is such a fine specimen of fossils. The church is almost entirely bare, and has an unfinished and desolate appearance."

LONDON's latest mammoth hotel, the Carlton, is now approaching the last stage of con-

struction. The external work is all completed, and little more remains to be done but to decorate and furnish the interior. Stripped of the scaffolding which has hitherto obscured its magnificent proportions, the façade now stands out finely as the spectator approaches it from Trafalgar Square. The style is of the florid Italian order, but it is not inappropriate to the situation at the foot of the Haymarket, which is one of the most conspicuous thoroughfares in London. Like the adjoining Her Majesty's Theatre, with which architecturally it has much in common, it is built entirely of white stone.

PUBLICITY was given a short time ago to a circular appeal issued by a committee of parishioners and friends of St. John de Sepulchre, Norwich, for funds to restore the church tower, which is badly in need of repair. As stated therein, a sum of about £1000 is required to effectually carry out the necessary work. The preservation of this relic of Norfolk antiquity will, it is thought, appeal to the sympathies of all East Anglians; but it is utterly impossible to raise the necessary funds in the parish, which is situated in one of the poorest districts of the city. The committee, therefore, earnestly solicit the support of the aristocracy of the neighbourhood, as well as that of the public at large, in completing the repairs.

THE friends of the Rev. Thomas Spurgeon have devised a novel scheme for bringing in money for paying for the new Tabernacle, Newington Butts. It being the birthday of the pastor, the members of the congregation gave Mr. Spurgeon a financial birthday present, to go towards the sum necessary for the rebuilding of the Tabernacle founded by his father. Mr. Spurgeon received the birthday presents himself. As most people are aware, the bottom portion of the ruined Tabernacle is being rapidly put to rights, so that services may be held while the other building operations are carried on. In a few Sundays this portion of the Tabernacle will be complete and ready for use.

LONDON statues are invariably very deplorable objects of Art, and are generally so thickly coated with grime or soot that any little ornamentation they may receive in the shape of a wreath of flowers is not to be despised. The statue of James II. at Whitehall is nearly as unlovely as was that monarch himself, and this fact so painfully impressed itself on the remnant of intelligence left among the members of the Legitimist Society that they resolved to club their pocket money together and purchase a crown of white lilies wherewith to adorn the sombre effigy on the anniversary of the king's death. Permission to place the flowers on the statue had been refused by the First Commissioner of Works, but, undaunted by this adverse attitude, the full membership of the Jacobite Society went at ten o'clock at night to Whitehall and deposited the wreath at the monarch's feet.

"FEW people know, for it is not written in their Baedekers, what treasures are contained in St. Benedict's Abbey, at Rheinan, within a walk of Neuhausen," writes a correspondent on the Rhine. "After crossing the Rhine by a quaint covered wooden bridge, one finds oneself in the old-world village, where babies of two and three welcome one by shaking hands, and saying 'grüss,' as is the pretty custom here. Hardly, even at Rome, have I seen more curious and interesting things than I did at the Abbey, or so many and such gorgeously embroidered vestments. One magnificent set was presented by Marie Antoinette, who rested here on her way to France as a bride; but that is, perhaps, the most modern. Then there are fearsome skeletons of old saints from the Roman Catacombs, clad in cloth-of-gold and coats of mail, with jewels for eyes; while the carving of the stalls and of the figures above them is very remarkable. The riches are endless, and few ever see them except lunatics, or the monastery adjoining is now a huge asylum for mad people."

KEYSTONES.

THE Corporation of Gloucester has appointed Messrs. Walker and Son as architects for the free public library, which is to be built at a cost of £6000.

THE new tower of the college at Bala has just been completed. The work was carried out by Mr. John Thomas, of Dolgelley, from the plans of Mr. Richard Davies, of Bangor.

NEW board schools are being erected at Horton, Stockton-on-Tees, and special consideration is being given to the ventilation, which will be carried out on the Boyle system.

NEW carved oak choir stalls are being constructed for the parish church of Heavitree by Messrs. Harry Hems and Sons, of Exeter, from the designs of Mr. E. H. Harbottle, F.R.I.B.A., Exeter.

OVER forty sites have been offered to the St. Olave's Guardians for the erection of cottage homes to accommodate the 700 children thrown on their hands by the dissolution of the Sutton schools.

A MEMORIAL turret quarter-clock with four large external dials has been given to the parish church, Normanton, Yorks. The clock has all the latest improvements inserted by Lord Grimthorpe.

A NEW central Hebrew synagogue, in Templar Street, Leeds, was consecrated recently. The cost of the building is about £4000. The premises include a synagogue with accommodation for 750 persons, and a schoolroom to accommodate 250.

THE foundation stones of the new Meersbrook Park Congregational Chapel, Sheffield, have been laid. The Architecture is Renaissance. Messrs. Hemsoll and Paterson, of Norfolk Row, are the architects, and the contract price is £3100.

PLANS of a Young Men's Institute, which is to be erected at Crossstone, at a cost of nearly £4000, have been passed. Mr. Alex. Cullen, F.S.A., is the architect, and the plans show a building, with gymnasium, lecture-hall, and reading and other recreation rooms.

THE workmen of Messrs. Marshall, contractors, of Rotherhithe, have commenced the destruction of an historical block, opposite Lambeth Palace, known for many years as Bunyan's Place, and in old times as the Archbishop of Canterbury's court, for the purposes of improving the southern approach to Lambeth Bridge, which, by virtue of a resolution of the County Council, will not long hence share a similar fate to the now "closed-up" bridge at Vauxhall.

MR. J. C. STEVENS conducted last week, at King Street, Covent Garden, his monthly sale of curiosities, etc., including a curious native club from China, long-handled axe, and carved wand of office—£5; a bronze mask representing a King of Benin—£10 10s.; a similar lot, larger, and of unusually fine workmanship—21 guineas; an antique matchlock gun, inlaid with gold, a fine specimen of early Indian work—£3 3s.; a coral armband taken off the arm of the King of Benin when captured—£3 5s.; and a Maratha Peishwa's State shield, richly decorated, from the collection of the late Admiral Seymour—£3.

FOUNDATION stones were laid on the 8th inst. at the new Sunday school which is to be built at Forde, near Saltash, and also of the enlargement to the Wesleyan Chapel attached, which is also to be re-seated and renovated at the estimated cost of £1312. Mr. Edgar M. Leest, of Saltash and Devonport, is the architect, and Messrs. Taylor and Mutton, of Jessamine Cottages, Saltash, the contractors for the work.

NEW county schools have been opened at Llangollen. Mr. H. Teather, architect, of Cardiff, has prepared the plans, and the contractor has been Mr. W. H. Thomas, Oswestry. Provision is made for 120 scholars. There is a large assembly hall, which may be extended so as to include two classrooms, which are shut off by folding-doors. Two other classrooms, a science lecture room, laboratory, cookery room, lecture room, and workshop complete the accommodation. Total cost of the land has been £1270, of the building £1040.

SECOND EDITION

NEARLY EXHAUSTED.

Specification.

No 2.

The following are some of the unsolicited testimonials received from well-known Architects, Civil Engineers, and Contractors:

"A perfect storehouse of information for Architects."

"Your very serviceable book."

"A Grand Number."

"The more one looks into 'Specification' the more useful does it appear to become."

"We are very pleased to have it in our Library."

"A splendid number of an invaluable work."

"I am greatly pleased with its appearance."

"Unique in English Technical Literature."

"In common with everyone else we cannot but admire your publication."

"Such enterprise as yours is worthy of every encouragement."

"A very excellent production."

"I trust the enterprise shown will be fully recognised."

"I wish you every success in so useful a publication."

"I consider it a very useful publication."

"We congratulate you on the issue, which is very good."

"The publication is well timed, and I trust it will meet with the appreciation it deserves."

"We are bound to say it is a wonderful production."

"'Specification,' appears to be a most invaluable work and one excellently arranged and printed."

BRITISH ASSOCIATION.

THE British Association concluded its annual meeting last week. We have culled from The Times reports, accounts of proceedings of the Mechanical Science Section and of the Anthropological Section when such proceedings seemed likely to be of interest to our readers.

PREHISTORIC ANTIQUARIES NEAR BRISTOL.

Professor Lloyd Morgan, in a paper on "Pre-historic Antiquities in the Neighbourhood of Bristol," illustrated by lantern slides the early camps and megalithic remains of the surrounding country. Of those at Clifton and Stoke-Leigh, just opposite on the Somersetshire side of the Avon, new and careful plans had been made under his own supervision. And in Stoke-Leigh the "dry-walling" which crowned the inner rampart had been exposed by special excavations. This was shown by means of photographs. Its character was compared with that described and figured by Mr. Dymond, at Worlebury; and the nature of the burnt lime and so-called mortar found in the Clifton and Burgh walls camps was discussed. Professor Lloyd Morgan then illustrated and explained the scheme of construction of the megalithic stone-circles at Stanton Drew, which will be visited by some of the excursionists on Saturday under his direction. These stone-circles of Stanton Drew were more fully detailed by Mr. A. L. Lewis, who showed that the diameters of the circles and the distances between them and the other stones forming this group of monuments were in carefully-measured proportions.

PALEOLITHIC CONDITIONS IN AUSTRALIA.

Professor E. B. Tylor read a paper on "The Survival of Palæolithic Conditions in Australia." He showed that the stone implements from Tasmania, the making and use of which by the natives came under the observation of the colonists during the first half of this century, have a character which may be called *quasi-palæolithic*. They were fragments or flakes of stone, in no case ground, but edged by chipping on one face only, and trimmed so as to afford a grasp to the hand, no haft of any kind being used, and correspond to some extent with scrapers, &c., belonging to the drift and cave periods in Europe, but their general rudeness, and the absence among them of symmetrical double-edged and pointed implements like the flint picks of the Old World palæolithic times, place the modern Tasmanians at a distinctly lower stage than the Europeans of the mammoth period. The stone implements found in Tasmania indicate a state of the stone age in past times not essentially different from that found in actual existence before the disappearance of the native population. The purpose of the paper was to offer evidence making it likely that the early stone age condition characterising Tasmania extended within no distant period over the whole Australian continent.

A NATIVE AUSTRALIAN HATCHET.

Professor Tylor exhibited a native Australian hatchet, hafted with gum on a stick-handle, lent by Mr. W. Ayshford Sanford, of Nynehead Court, Somerset, who brought it half a century ago from the Perth district of West Australia, and said that the blade of this instrument, with its unsymmetrical edge formed by chipping along one side of the original flake, was simply indistinguishable from the ordinary Tasmanian form placed beside it. Unwilling to judge hastily from a single specimen, he had for years been in correspondence with anthropologists in Australia as to the presence there of such implements, and had lately, through communications from the Bishop of Tasmania and Mr. Alexander Morton, of the Hobart Museum, received intelligence that the latter had on a late journey to the little-known Murchison district in West Australia, while not meeting with ground stone axes, found the natives using chipped stones quite similar to those used by the Tasmanian aborigines, as shown by photographs sent for comparison. These *quasi-palæolithic* implements not having yet been discovered in this district by the ground stone hatchets, which apparently were

introduced from the Torres Straits region, it would seem that this neolithic invasion was of no remote date, and that the vast area including Australia as well as Tasmania may have been till then peopled by tribes surviving at a level of the stone age which had not yet risen to that of the remotely ancient European tribes of the drift gravels and limestone caves.

ANCIENT EGYPT.

Professor W. M. Flinders Petrie gave an address, illustrated by many beautiful lantern slides, on "Egypt under the First Three Dynasties, in the Light of Recent Discoveries." His object, he said, was to give a summary of the principal discoveries during the last five years that had revealed the rise of Egyptian civilisation. It had been said that the beginning of the fourth Egyptian dynasty—the age of the pyramids, about 4000 B.C.—was the furthest back that we could go. The puzzle was that there had been no trace of this high civilisation. But now entirely new discoveries during the last three years at Koptos, Nagada, Abydos, and Hieracopolis, and various excavations had discovered remains belonging to the ages before 4000 B.C., which had hitherto been the starting point of known history. Beginning with the Libyan stock, with some negro mixture, which occupied Egypt in its earliest civilisation, he showed some of the objects he had found at Nagada—statuettes, games, slate palettes for grinding paint, beautifully ribbed flint knives of extreme delicacy, forked lances and arrows, carved spoons of ivory and bone, harpoons, bracelets, and combs. These were at first temporarily assigned to a new race, as we knew nothing more about them; but now they could be safely assigned to the pre-dynastic stock about 5000 B.C., and even earlier. In the graves of this aboriginal race were found

BOWLS OF BLACK CLAY

with patterns imprinted upon them. They were of great importance in considering the relation of this civilisation to that of others in the Mediterranean. In each of the countries where this had been found—Spain, Bosnia, Egypt, and Hissarlik—it was contemporary with the introduction of metals. Metals had just been introduced, and therefore in all cases this pottery was associated with the same state of civilisation. The proximate date of this was the close of the Neolithic period and the introduction of metals—viz., 5000 B.C.—and that accorded very well with the time necessary for arriving at the high culture attained by 1500 B.C. Therefore these discoveries were of great value in giving the relative state of Egyptian civilisation to that of the rest of the world at the introduction of dynastic rule. There was a wide difference between the people of 5000 B.C. and those of 4000 B.C., but no difference between those of the latter period and modern times. This showed that a different race entered the country about that period. Next came the earliest dynastic remains of the

PRESUMED TOMB OF KING MENA,

the founder of the dynastic history of about the date of 4700 B.C., then the remains of other royal tombs found at Abydos belonging to the first three dynasties. The skill of flint working had undoubtedly gone down, and was fast dying out. The gradual decay of flint working between 4500 B.C. and 1500 B.C., as metals came into use, and copper was gradually hardened into bronze, had no parallel in the world. Professor Petrie showed diagrams of cylindrical seals as used by the kings of the first three dynasties, and impressions of such cylinders which were vastly more frequently found than the seals themselves. He then showed a vase exhibiting the earliest representation of Egyptian mythology and other vases, tablets, and slates showing animals and birds, such as the hawk, bull, lion, and leopard, which manifested a well-acquired knowledge of these animals, as well as of the ibex, gazelle, and antelope. Large numbers of animals, such as the calf, monkey, and dog, had been found modelled in green clay, together with a model of

A LION IN RED POTTERY.

These finds were very important, as they showed the skill of clay modelling of the

earliest dynasty, the rise of the art of modelling, and the Egyptian ideas and appreciation of the forms of animals and of the human body. These important monuments of the civil life of the early kings proved that glazing was a speciality of the original people, and that Egyptian art reached its high-water mark somewhere before B.C. 4000. Other finds showed the kings in triumph over their enemies, receiving captive kings, opening the public works, or reclaiming the marshes. Others were vessels with dedications written upon them, and stone jars with chambers as storehouses for the king's soul. The handled copper vessels showed the most advanced metal work found of the first three dynasties. The population of the pre-dynastic age was different in type from that of historical times, and in the early monuments the presence of diverse types was very clear, some being shaven, some bearded, some long-haired. We had at last before us evidence of the close of the period previously considered prehistoric, showing the

DEVELOPMENT OF THE ART,

writing, and civilisation of Egypt and the composition of a race which had since maintained its character during 6000 years. The puzzle was how this civilisation arose and we had discovered evidence to solve this puzzle. Egypt was then an originator in the arts and not a borrower, but ever since then most of the nations of the earth had been borrowers and not originators. Here we were studying the history of a country not borrowing but developing a vast and complex civilisation on its own resources.—Sir John Evans said that during the last few years, as Professor Flinders Petrie had shown, we had been able to unveil the progress of civilisation in Egypt over 1500 years. The wonderful flint knives shown by slides had been the most important discoveries ever made in Egypt, and must have been the culminating point of an art stretching over a vast series of years. He asked himself, Where was all that civilisation of

B.C. 5000

developed? He hoped that the recent conquests in Egypt would materially assist us in investigating that matter, and discovering more of the wonderful history of which we were now only on the threshold.—Mr. Arthur Evans thought a comparison of the pottery of Crete and Malta and other parts of the Mediterranean basin with that of Egypt helped to form a bridge over the gap which separated Early Egypt from the dawn of civilisation in Europe. In respect of chronology, he considered that Professor Flinders Petrie would be safe in assigning his discoveries even to an earlier date than he had done.—Professor Flinders Petrie, in his brief reply, said that he himself thought that he was well within the mark, but he chose the date he had fixed in order to be absolutely safe.

ELECTRIC POWER IN WORKSHOPS.

Mr. Siemens, in reading a paper on "Electric Power in Workshops" before the Mechanical Science Section, pointed out that the first development in this direction took place in connection with the small line exhibited in Berlin by Dr. Werner Siemens in 1879, and in the present day there is, he considered, little doubt that in the near future horse and steam tramways will disappear everywhere. In overcoming heavy gradients the ultimate triumph of electricity is assured. Although even the heaviest goods train can be drawn by electric motors, Mr. Siemens pointed out that it would be a fallacy to deduce that it would be advantageous to replace the steam locomotive on all existing railways by electric motors as economical factors have to be considered as well as technical features. Electric transmission is best applied where the demand for power is constant rather than intermittent. The paper next dealt with the losses that must be met in carrying out a system of power transmission by electricity. The first point to consider was that the available mechanical energy had to be converted into electrical energy, and such a transformation involves loss. The ease with which electrical current can be carried and other advantages more than counterbalance

this loss, which is not excessive, 84 per cent. of the i.h.p. of a steam engine being available at the terminals of a dynamo in the form of electrical energy; whilst electric motors will produce over 90 per cent. of the electrical energy supplied to them in the shape of mechanical power. The art of insulating conductors has improved to an extent that, whereas a short time ago currents of 2000 volts were considered a limit, there are now a number of successful electric systems employing currents of 10,000 volts pressure. The use of alternate currents, the employment of transformers, permits the use of low-pressure generators and motors, high-pressure currents being used in the conductors, but in this there is the loss of double transformation. The author was of opinion, however, that were a trustworthy alternate current motor invented this system of transmitting power would be the dominating one. Unfortunately alternate current motors refuse to start without being first synchronized by external means, are liable to stop when overloaded, and their speed cannot be varied. A continuous current system is simpler and cheaper at first cost and cheaper in maintenance. The installation of electric power transmission for working the machine tools and other appliances in the works of Siemens Brothers and Co., at Charlton was next described in detail, the author giving some very valuable figures as to cost, &c. He states that six years' work has shown that the system is perfectly trustworthy, and that an expected great saving in the cost of attending to the motive power has been fully realised. The total cost of motive power during the year 1897 was £9900, or 2d. per Board of Trade electrical unit, and 1.71d. per brake-horse power per hour exerted by the motors.

EXCAVATIONS AT GLASTONBURY.

Mr. A. Bulleid read the third report of the committee appointed to investigate the excavations of the Lake Village at Glastonbury. He observed that since the presentation of the last report much progress had been made with the exploration of this lake or marsh village. Twelve more dwelling mounds had been examined, as well as the ground between and around them. The southern end of the settlement had been completely explored, and the investigations had yielded much of importance. The timber substructure in this locality was in a better state of preservation and more massively made than in any part of the village hitherto examined, the arrangement of the logs being exceptionally clear. The recent finds included brooches and rings of bronze, adzes and billhooks of iron, leaden whorls, blue glass beads, gouges and needles of worked bone, combs and hammer heads of horn, much pottery, some jet and amber, portions of twenty-five human skeletons, including four complete skulls, and tubs, cups, and ladles of worked wood. A new village had been partly excavated this year.

GLASTONBURY'S ANTIQUITY.

Mr. Arthur Evans supplemented this report with an interesting paper on the "Place of the Glastonbury Lake Village in British Archaeology." He insisted upon the homogeneous character of the culture here revealed, and showed that it belonged entirely to the pre-Roman period and the first and second centuries B.C. It represented a distinct phase of a form of culture introduced into Britain by the invading Gaulish tribes. It was possible to trace back various forms of vases, safety-pins, and other relics, to prototypes in the old Venetic regions about the head of the Adriatic. The glass-working industry of the Glastonbury lake folk was probably derived by the same overland route from the old Venetic region where recent discoveries showed that this art flourished already in prehistoric times. The name Glastonbury itself was a translation of the Celtic Ynis Witrin—Glass Island—and there might be more in the appellation than had hitherto been suspected.

A GREAT ARCHAEOLOGICAL DISCOVERY.

Professor Boyd Dawkins said he thought that this lake village was one of the most important archaeological discoveries recently made in Western Europe. The inhabitants of that

village had most probably introduced both glass making and lead mining. At first sight Mr. Arthur Evans' derivation seemed of the old-fashioned dictionary sort, but he had no doubt that it was correct. He remarked that the fact of those prehistoric people having had such amusements as cock-fighting and dice games showed that they had arrived at a very high stage of civilisation.—Sir John Evans expressed his admiration of the manner in which the excavations had been conducted. The mere fact of the dwellings being in that unsuitable position seemed, he thought, to point to the probability that the constructors were lineally connected with other lake dwellers on the Continent of Europe. Some hereditary connection with those Europeans must have been the cause of the choice of marshy places for village building, since near at hand there were other sites far more suitable for dwelling places. It was only by the careful use, he urged, of spade, trowel, and knife that we could hope to become acquainted with the civilisation of that important and interesting prehistoric time.

TERRAMARE SETTLEMENTS IN NORTHERN ITALY.

Professor W. M. Flinders Petrie then read an interesting paper, illustrated by diagrams and plans, on "Traces of Primitive *Terramare* Settlements in the Modern Towns of North Italy." He showed that recent clearing at Castellaro di Fontanellato had disclosed the fact that the marsh towns of North Italy in the Bronze age were arranged on a strictly square system of crossing roads, and that this type of town was that perpetuated in the regular plan of the camps of the Roman army. On examining the present plans of the cities of Lombardy, the outline of the original square settlements could be plainly traced. This was illustrated by plans of Florence, Bologna, Parma, Cremona, Pavia, Piacenza, Milan, and Trent. The characteristics of the old boundaries were the ditches yet remaining and the parallel roads that ran along the sides of them, the roads radiating from the gateways, which afterwards became streets in the enlarged towns, and the surviving names of streets referring to the walls and gates which had long since been swallowed up in new buildings. Professor Petrie observed, in conclusion, that thus the view of primitive Italy, before even the Roman age, could be traced in the pages of the familiar Baedeker.—A short discussion followed, in which Sir John Evans and others said that they must take Professor Flinders Petrie's conclusions with a certain amount of caution, for the existence of square forms of towns did not itself prove that those forms were of pre-Roman date.—Professor Flinders Petrie, in briefly replying, said that was not really his argument. His view was that, granting or assuming the pre-Roman date, the square forms of the towns would indicate the presence of *Terramare* settlements.

MEGALITHIC MONUMENTS OF DARTMOOR.

Mr. P. F. S. Amery then exhibited, with explanatory remarks thereon, a series of lantern slides showing the Megalithic monuments of Dartmoor. The slides indicated huge stone structures and monoliths in different positions, and Mr. Amery pointed out the curious results of disintegration produced by water, weather, and earthquake tremors during the lapse of many centuries.

THE SILCHESTER EXCAVATIONS.

Mr. J. L. Myres read the report of the committee appointed to co-operate with the Silchester Excavation Fund Committee in their explorations of the old Roman town. The excavations, covering nearly eight acres, were begun on May 3rd, 1897, and continued, with the usual harvest interval, until November 3rd, and were renewed in the spring of the present year. The objects found were exhibited, as in former years, at Burlington House.

STANDARDS OF PURITIES FOR SEWAGE EFFLUENTS.

Dr. S. Rideal, discussing "Standards of Purity for Sewage Effluents," pointed out that the majority of these standards are arbitrary and artificial. But a calculation of the proportion of nitrogen in its oxidized forms, which are

harmless, and its unoxidized forms, which are odorous and sometimes deleterious, would denote the extent to which the sample has been purified. The number obtained is termed the "percentage of purification," and ranges from nothing in raw sewage to 97.6 for a deep well in chalk. Moreover, with the aid of bacteria, the oxygen combined with nitrogen, that is in the form of nitrates and nitrites, is capable of supplementing the free dissolved oxygen in the destruction of the organic matter. From these considerations a formula is deduced embodying all the natural data for the conditions of discharge of an effluent into a stream, including the flow and aeration of the latter, the volume of oxygen required, and the "available oxygen of the effluent," the result being a "factor of safety," which must never be below unity. It is concluded that an effluent which has been properly prepared and is in an active state of wholesome bacterial change under the above conditions of free and potential oxygen, is clear and nearly free from odour, and may be safely discharged into any river of moderate volume.—Some discussion followed.

CONCERNING CAVES.

The Rev. G. C. H. Pollen gave an account of the "Further Exploration of the Ty Newydd Cave at Tremeirchion, North Wales." He said that in the upper portion of the newly explored part a stalagmite floor had been found *in situ*, completely sealing up the local gravels. Over this were found 5ft. of clay with broken limestone, which was all that was left to represent the strata in which the former roof of the cave was situated. The whole was now overlaid with boulder clay, containing many specimens of northern and western drift, with striated stones of more local origin. No trace of erratics or of glacial stones had been found in the lower cave materials.—Mr. Thomas Plunkett followed this with an account of the "Further Exploration of the Fermanagh Caves." In his previous explorations he had formed the opinion that the caves contained no mammalian remains; but he had now discovered an entire cranium of what he believed was the great cave bear (*ursus spelæus*) in one of the Knockmore caverns that penetrated a cliff not far from the formerly explored caverns. The height of this cave was about 40ft., and its length 90ft.

THE first year's working of the Dover Corporation's electric tramways, after allowing for payment of interest and instalments of the loans, had resulted in a profit of £1300 being earned. This is equivalent to a 2d. rate.

VERY few churches are so charmingly situated as Christ Church, Fulwood, Sheffield, yet the interior of the building is altogether out of keeping with its artistic surroundings. The members of the congregation have embarked upon a scheme to renovate the church, and within a short time about £350 will be spent in beautifying the building. Ten new windows of cathedral design, with stained glass, will replace windows sadly in need of repair, and four others will be repaired. The lighting arrangements will be specially attended to, and instead of several gas standards dotted about the church, a corona will be placed in the centre of the roof. Extensive work in the way of repainting and redecorating will also be carried out.

THE directors of the Sheffield and Hallamshire Bank, having purchased a site at the corner of Sitwell Road and Sharrow Lane, Highfield, Sheffield, have commenced the erection of a branch bank thereon. The new building will form a conspicuous feature as seen from London Road, and will make a capital central piece in the open space at the junction of Sharrow Lane and Sitwell Road. The building, which has been designed by Messrs. Flockton, Gibbs and Flockton, will be in the modern French style, and will be composed of brick, with a large quantity of stone dressing windows, and other architectural features. There will be a Mansard roof, and the main entrance, facing London Road, will be under a semi-circular portico, and will have Swedish granite columns and pilasters. In the pediment above the portico will be placed a clock.

Professional Items.

ABERTILLERY (Mon.).—The new girls' school recently erected here has just been opened. The school is built of blue pennant stone, with Forest of Dean dressings. It is fitted with all modern conveniences, the cloak-room being especially good. The floors are laid with pitch pine blocks. The building is heated by hot-water on the high-pressure system. The contract has been carried out by Mr. A. P. Williams, builder, Abertillery—the architect being Mr. George Rosser, Abercarn.

ALDEBURGH.—A new bridge has been erected over the Haven at Aldeburgh. Exclusive of the approaches, which are each 20ft. long, the bridge is 280ft. across. It is bowed out at the centre to a width of 20ft. for the provision of the passage of vehicles, and its general width is 15ft. It is built upon 15 piles on either side, and a concrete foundation for the roadway is supported by iron girders 3ft. apart. The surface of the roadway is formed of burnt shingle, tar, and crag, but owing to the heat this is at present in a very soft condition, and it is unfortunate that there have been no showers to assist in its solidification. At present there is no good approach to the bridge, but the Corporation are having constructed a road, though it is yet only in a very crude state, and does not extend the whole of the distance. The entire work has been carried out by Messrs. Dewsbury and Sons, bridge builders, Wisbech.

ASTON.—The foundation stones of the Aston Manor Baptist Chapel were laid last week. The new building is designed in the Old English period of Architecture, and, roughly speaking, measures about 55ft. by 40ft., and will seat 400 persons. It is situated at the corner of Thomas Street and Yates Street, and will have an imposing entrance with side lobbies, opening directly on to the floor. There are also a gallery, which will accommodate between 80 and 100 persons, choir, and baptistry. The heating and ventilation and the light have received special attention, and the acoustic properties of the chapel have also received the architect's consideration. The actual cost of the work itself is £1600.

BARRY.—The Barry School Board has considered tenders for the erection of the proposed Hannah Street School at Cadoxton. The following were the tenders received:—William Britton, Barry Dock, £14,694 14s. 9d.; Samuel Shepton and Son, Cardiff, £15,365 10s.; Watkin Williams, Pontypridd, £14,535; Mainwaring and Davies, Llanbradach, £12,905; John Linton, Newport, £14,700; Alban Richards, Barry Dock, £13,500; James Allen, Cardiff, £15,460; E. R. Evans, Cardiff, £15,405; Chubb and Co., Cardiff, £13,797; Lloyd and Tape, Barry Dock, £14,713; J. Prout, Barry Dock, £15,092 11s. 10d.; Jones Bros., Barry Dock, £14,470; W. Thomas and Co., Cardiff, £14,941; Turner and Sons, Cardiff, £15,450; J. L. Hockridge, Cardiff, £15,290; George Rutter, Barry, £12,275. Mr. George Rutter's tender, being the lowest, was accepted. Mr. H. Budgen, Cardiff, is the architect of the building, and his estimate was stated to be £14,631.

BELFAST.—The foundation stones of the George Thomson Memorial Hall, which is being erected in connection with Broadway Presbyterian Church, Belfast, have just recently been laid. When completed, the new building will add much to the appearance of the church, as it is being erected at the rear of the edifice, and arranged so as to have direct access to it and to adjacent streets. Provision is made on the ground floor for a large minor hall, with committee, vestry, and cloak rooms attached. Access is gained to the large lecture hall on first floor by a spacious staircase opening off the vestibule. At one end of the main hall, which is 64ft. by 32ft., is a cloak room, and at the other is a platform raised six steps from floor level. There are a series of Gothic-headed windows, filled in same style as the church. Underneath the sills of the windows

in front gable a deep panel of stone will bear the inscription, "Thomson Memorial Hall." A date stone occupies the centre space above. The roof is a king post with carved ceiling. All the internal work, including wainscotting, will be varnished. The contractor for the work is Mr. Thomas M'Millon, and the architects Messrs. Young and Mackenzie.

BRADFORD.—The Bradford School Board has accepted tenders for the erection of the new Carlton Street Higher Grade Girls' School and the junior teachers' central classes, amounting to £10,660 10s., including mechanical ventilation. The higher-grade school will have accommodation for 713 scholars, and the junior teachers for 135. The new premises will occupy the north-west corner of the present school, and will be 146ft. long by 69ft. wide. There will be practically four floors—sub-basement, basement, ground floor, and first floor. The sub-basement will be used wholly for the mechanical ventilation apparatus, boiler, and engine.

FARSLEY.—The corner-stones have been laid of a new Constitutional Club at Farsley, Yorkshire. The building, which is to cost about £2000, will be in Norman Gothic style of Architecture, with a commanding tower. The architect is Mr. G. C. Gamble, of Bradford, and the following are the contractors:—Mason, G. A. Walker, Farsley; joiner, John H. Robinson, Farsley; slater, Frederick Thompson, Stanningley; plumber, Edward Pearson, Farsley; plasterer, Wilfrid Busfield, Farsley; painter, H. Grimshaw, Farsley; iron-founders, Whitehead Brothers, Farsley.

GLASGOW.—The Water Committee of Glasgow Corporation have accepted the offer of Messrs. Robert MacLaren and Co., Glasgow, for the supply of 995 tons of cast-iron pipes. Messrs. MacLaren's tender was £4958 8s. 4d. A Philadelphia firm, Messrs. R. D. Wood and Co., offered to fulfil the contract for £4892 1s.; but in view of the slight difference between the contracts, the committee decided not to place the order out of the country.

LONDON, E.—A new block of business premises has been erected in Boundary Street, Shoreditch. The new building contains a superficial area of 19,000ft., and is constructed so as to secure the maximum of light, whilst ample ventilation throughout is obtained by means of large "well holes" placed in the centre of each floor.

LIVERPOOL.—It is proposed to build a new Church House for the diocese of Liverpool. The proposed building will occupy the site at the corners of Lord Street and South John Street, now known as the Clarendon Buildings. It will probably be built in sections of terra-cotta, and will be lighted electrically throughout. The main entrance, leading to lift and staircase under the tower, will be from South John Street, as also a second entrance with lift and staircase from the same side. The Lord Street section to the tower entrance from South John Street, which is to receive the first attention, has been estimated approximately to cost £10,000 without the tower, and with the tower about £14,000. The whole building, Lord Street and South John Street sections, when completed is estimated to cost from £30,000 to £35,000.

NOTTINGHAM.—The memorial stones of a new Congregational Sunday school at West Bridgford have just been laid. The style adopted by the architects is Late Decorated, somewhat freely treated. The building is of red brick with stone dressings, and in the front gable is a large five-light tracery window, flanked on either side by massive buttresses. There are four entrances to the schools, with lobbies—two will be approached from Muster's Road and two from Millicent Road. When the church is built there will be an additional entrance, with large lobby connecting the church with the schools. Advantage of the necessarily deep foundations has been taken to provide large store rooms and a heating chamber under the schools. The roof of the schoolroom is of open timber work, with wrough ties and principals. The whole of

the windows will be glazed with cathedral glass, and a portion of each window will be made to open for ventilation. Every attention has been paid to the warming and ventilation, which will be of the most approved type. The contract for the buildings is about £2200. The architects are Messrs. R. C. and E. R. Sutton, Bromley House, Nottingham; the contractor, Mr. W. Maule.

PETERBOROUGH.—The new electric light works for the town of Peterborough have been started, so far as the foundations are concerned, on a site in the Albert Place Meadow, adjoining both the River Nene and the Great Northern Railway. At present, however, the full plans for the superstructure, by Mr. J. C. Gill, the borough electrical engineer, are not quite completed. The scheme, nevertheless, having been generally approved by the Local Government Board, it only remains for the engineer's plans to be passed by the Corporation and the construction thrown open to competition by tender.

RIPON.—The excavators, bricklayers, and masons' work in connection with the erection and completion of new banks at Ripon for the Knaresbro' and Claro Banking Company has been entrusted to Mr. Anthony Lyons, contractor, of Norton, Malton. The designs are by Mr. Arthur A. Gibson, architect, Harrogate.

STRATFORD-ON-AVON.—A meeting of the subscribers to the fund for a proposed technical institute was recently held at the Stratford-on-Avon Town Hall. The Mayor said the meeting was called to take into consideration a scheme proposed by Mr. Edgar Flower. A statement as to the work done by the committee was given by Mr. A. D. Flower, who said they had three sites in view. Of these, however, one was practically out of the question, one the owner refused to sell at any price, and he was prohibited from doing a deal for the other as it was Corporation property. The scheme then looked like falling through, but he was glad to say they had secured a site which was suitable for the purpose. If that site were adopted the proposed reading-room must drop out, as there would be no room for it, and he could not see that there was any means of endowing it. The site was in Henley Street, and, although the frontage was small, it would allow of a large room, 40ft. by 30ft., for the School of Art, offices, and one good room for modelling, carving, or other purposes. It was ultimately decided that the committee should be empowered to prepare plans.

WHITBY.—Building operations have been brisk here of late, and mention should be first made of the very large Hotel Metropole, just opened this season, built for and by Messrs. Whittaker, of Horsforth, from the designs of Messrs. Chorley and Connon, Leeds. The hotel is of brick and stucco-faced, with four large towers, and has an imposing appearance from the cliffs. A new café and dining room, of which Mr. E. H. Smales was the architect and Mr. J. Brain the builder, has been opened. Mr. Edwards also has just entered on his new premises, also café and dining room. Mr. J. Cabel Petch, of Scarborough, was the architect. Some land on the West Cliff is being built on, semi-detached villas with half-timbered work being erected from the designs of Mr. G. Scarfe French. Some bungalows at Sleights, near Whitby, have also been designed by the same architect. Several villas are shortly to be commenced on the West Cliff Estate, belonging to Sir G. Elliot, Bart., from Mr. Hy. Walker's plans. A new bank for the York Union, now in course of erection in Baxtergate, will be a fine building. Mr. Wm. Gwyther, Temple Chambers, London, is the architect, and Mr. J. Brain the builder. A new post-office, Mr. Hy. Tanner, architect, is an imposing building with a stone front. The Urban District Council is making several fine roads, and laying out the present Royal Crescent Green into a miniature park. At Sandsend, adjoining Whitby, several new and picturesque bungalows have been built on the Marquis of Normanby's land.

Views and Reviews.

KENSINGTON PALACE.*

This little work is apparently intended as an ornamental booklet for the drawing room table of residents in that fashionable suburb. From the purely architectural and artistic point of view the subject is, of course, not a very interesting one, though one or two entertaining books or chapters have been written upon or around it. Mr. Loftie has corrected the more important (and not very recondite) dates and facts concerning this familiar "pile," suggestive to the ordinary English eye of comfort (leaving out of view the State apartments), but rarely of beauty. He has even included a description of the oft recounted accident to the youthful Princess Victoria at Highgate! and the opening in 1830 of the Victoria Park at Bath. But he has not succeeded in writing an interesting book. It is not, of course, his fault that nothing of any particular importance seems to have happened at Nottingham House, which in 1690 became Kensington Palace, either before or after that date. For the birth of Queen Victoria, "the most important event" in the building's history for the past two centuries, is scarcely of so much local significance that the Palace has any bearing upon the happiness of the English people in 1898. A volume of this size, which could not pretend to be a history, had much better have wasted less of its space in rehearsing well-known or uninteresting facts and given us a few original "notes" of the odds and ends of beauty and picturesqueness scattered about the Palace, and its surroundings illustrated with a few bright and forcible drawings. The so-called "illustrations" to the book are, for the most part, commonplace reproductions of commonplace photographs and views of Pyne; and the frontispiece—the Princess Louise's statue of Her Majesty—would be a distinctly bad and tasteless illustration, whatever the merits of the work of Art placed so exactly in the centre of it in the worst of lights. The sketch of the Queen's birthplace (the barest view of three blank walls, a ceiling, and a window) might be a scrap from any builder's notebook, and is not made more exciting by the reflection that it is not quite certain that our beloved Sovereign was born in that particular apartment. The photographic views of Kensington, where not already familiar to our readers, are in no sense worthy of reproduction; the muzzy drawing by W. Luker, jun., of the "Orangery" is ludicrously out of perspective, and the engravings (or whatever they may be) "After Pyne" are mostly too small to give the only satisfaction attaching to such laborious and detailed work. On the whole, it is a thousand pities that some capable modern draughtsman has not displaced the local photographer in a work which could only by such means have been endowed with any real interest or importance.

* "Kensington Palace," by W. J. Loftie, F.S.A. Farmer and Sons, High Street, Kensington.

THE Local Government Board has sanctioned the necessary loan for the erection of a new town hall at Colchester, at a cost of £36,000, and the work will at once be proceeded with. The tower and chimneys for the new building, estimated to cost £2000, will be given by the Mayor. The borough member (Sir Weetman Pearson) has contributed a new organ for the assembly room, and gifts of stained-glass windows, statuary, and paintings, are promised by leading townsmen.

THE question of increasing the hospital accommodation, by extending the eastern hospital in Mill Lane, Old Swan, has for some time been under the consideration of the Liverpool Corporation committee having charge of that portion of the city's administration. The matter has now so far advanced that plans of the proposed scheme have been prepared, and should these meet with the approval of the City Council, an application will be made to the Local Government Board for sanction to the borrowing of £40,000 for carrying out the work.

Enquiry Department.

A CLIENT'S DILEMMA.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am thinking of getting up a design for shop premises, to contain draper's shop on ground floor, solicitor's offices on first floor, and curator's lodgings at the top; also a storing cellar. If you could tell me what accommodation would be most convenient for each floor I should be greatly obliged.—I remain, sir, yours faithfully,

PUPIL.

We should have thought this a query to be put to the client rather than to the editor of THE BUILDERS' JOURNAL; in fact, a general answer cannot be given, so much depending upon the site and the extent of the various businesses to be carried on. Were we to reply at greater length we are afraid we might become rather caustic.

INGLE-NOOKS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you oblige me with some information as to the manner of treating old-fashioned ingle-nooks, when it becomes necessary to do away with the open hearth and substitute a modern grate? Is it necessary to carry up an entirely new flue in brickwork to reduce the size of the very large, old-fashioned chimneys? Also, how should the ceiling to the ingle-nook be formed when closed in?—Yours faithfully,

"ANTIQUARIAN."

The treatment of such a fireplace must depend on the circumstances of the case, the present construction of ingle-nook, the style of work wanted, the cost, &c. As a general rule, it is necessary to fill up the large flue at the bottom, or provide a new one of smaller section, to prevent the fire smoking. You might, perhaps, be able to turn the new flue in over the ceiling of ingle-nook into an iron one carried up the old flue. For the ceiling—could you throw a light brick arch across, and decorate the soffit?

FUMIGATING OAK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Some time ago I wrote asking for information on staining oak other than fumigating, and I had a specimen of oak sent me by a north country firm which was simply perfect; it was stained right through the whole thickness, and could therefore be worked after it was stained. The colour was the same as is seen in old chests, &c., a dark brown, and just such an one as I required for the work I was about—a chimney-piece and overmantel in carved oak. The firm refused to tell me how it was done, therefore their information was utterly useless to me. "Aberdeen" requires the same knowledge which I am anxious to obtain myself, but how are we to solve the riddle? Ammonia merely stains the skin, and, like all stains, will wear off at the edges, and show white if subject to much wear and tear.—Yours faithfully,

J. K.

If the firm referred to are in possession of a method for staining oak of any thickness of an uniform colour throughout, easily applicable to joiners' or cabinet work when made up, they have a good marketable commodity, and can scarcely be blamed for refusing to give away the information gratis. It is, however, extremely doubtful that such is the case. The specimen sent was probably of small size, and had been steeped or boiled in stain, as is done with all coloured veneers, but the process is obviously inapplicable to wrought work. Again, oak, rich in gallic acid, may be stained a considerable depth by exposing it for a long time to the fumes of ammonia; the outer surfaces will become nearly black, but the required tone may be obtained by planing to a sufficient depth. If the oak is of a suitable kind for staining (and all are not American, for instance), and the work is polished or waxed immediately after staining, the colour will not fade, either at the edges or elsewhere, any such places that may have been observed were probably sapwood, surface coloured.

TO ABATE A NUISANCE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Close to my works there are some small cottages, and a villa where the landlord resides. The owner and the tenants of the cottages persist in throwing their rubbish against my building, which is on a by-road; therefore the rubbish is left on the roadside as well as against my wall, which I consider to be a nuisance to me. I have written several times to the Clerk of the Rural District Council, and have failed to get a reply from him. I shall esteem it a favour if you can advise me what steps to take to prevent a continuance of this rubbish accumulation.—Yours truly,

G. D.

Complaint should be made to the Inspector of Nuisances, and not to the Clerk of the Urban District Council, unless the Inspector neglects to do his duty, when the Council could interfere; but if the nuisance is a real one, and prompt action, on complaint to the Inspector, is not taken, it would be well to appeal in person to the magistrates.

Correspondence.

THE SORROWS OF JERRY BUILDERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In reading your article on the East London Water Supply, I was struck with your remark that the water trouble was caused principally through the jerry builders neglecting, for their own ends, to provide cisterns for storage. I was under the impression that I had read during previous droughts that the Company had previously compelled cisterns (already fixed) to be taken out before the constant supply could be provided; at any rate, I do not think the practice of the water companies allow builders to do just as they please in the matter—their rules and regulations have to be adhered to, cisterns or not. So why the poor jerry builder (whoever he may be) should always come into it and have to bear the brunt of everybody's errors, I cannot understand. Shortly after reading your remarks, I happened to notice in the London Daily Chronicle, of September 9th, a leading paragraph confirming my impressions. A good many builders build houses and may not put storage cisterns; that is no reason why they should be classed as jerry builders, especially as of late years (whether right or wrong) the tendency has been to discontinue the use of same on constant supplies.—Yours, &c.,

WM. DRAKE.

3, Lechmere Road,
Willesden Green, N.W.

COASTGUARD PATHS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—You note the risk that is being run of rights of way being lost. Will you permit me to suggest that the question of coastguard paths is one which might be taken up with advantage to the community?

What is the origin of the coastguard path? From the earliest times it has been the duty of some man, or body of men, to watch the coast (probably the earliest title in England was "Count of the Saxon Shore"). It is, I think, clear that the coastguard paths have been used for nearly 1000 years. If this is not a good title by user I don't know what is. But it is always admitted that "once a highway always a highway" is good law; therefore, there should be no difficulty in obtaining the re-opening of the coastguard paths and public access to the sea at all points. In some places the insolence of private owners has gone so far as to claim a right to close the path, and as a matter of grace to permit the coastguard to have a key, so as to pass through the grounds.

On one portion of the Devon coast I found that quite two-thirds of the sea-front is blocked to the general public, and the finest scenery either reserved for a Lancashire manufacturer and his friends, or forbidden to all by a farmer.—I am, Sir, yours &c.,

H.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ANNFIELD PLAIN (Durham).—Accepted for the construction of conveniences, for the Urban District Council. Mr. T. J. Trowsdale, surveyor, Council Offices, Annfield Plain.

BELEVIERE (Kent).—For erecting two small houses, providing drainage to laundry, &c., for Mr. Wm. Smith. Mr. John H. Willis, architect, 18, Dagmar-road, Camberwell, S.E.:

	Houses.	Retaining Wall.	Drainage Laundry.
H. E. Chandler, Belvedere	£585	£75 0	£52
T. Freeman and Son, Camberwell	600	52 10	35
L. L. Leeder & Co., Chiswick	487*	50 0*	50*

BOSTON SPA.—For the execution of drainage and outfall works, for the Wetherby Rural District Council:—

	Contract No. 1.
H. Wilson	£6,173 8 0
W. Brigg	5,935 8 0
M. Arundel	5,822 15 0
Graham and Son	5,700 9 0
A. Braithwaite and Co.	5,444 17 6

CHIGWELL.—For the erection of ophthalmic buildings at Chigwell, Essex. Mr. A. E. Pinder, architect:—

F. V. Carter	£5,004
W. Keefe	5,590
George and Hosking	5,537
H. Reed	5,765
W. M. Norton	5,747

CHINGFORD.—For the erection of factory at Hale End, Chingford. Mr. J. Rookwood, architect:—

W. Shurmur	£23,528
Harris and Wardrop	3,519

DEVONPORT.—For the construction of a public convenience, Northcorner Quay, for the Town Council. Mr. J. F. Burns, Borough Surveyor, Municipal Offices, Ker-street, Devonport:—

J. Healy	£264
T. Jenkin and Son	229

EWELL (Surrey).—Accepted for the erection of villa at Ewell, for Mrs. Omar. Messrs. Richards & Co., surveyors, 15, Wallbrook, E.C.:

L. L. Leeder and Co., Chiswick	£157
--------------------------------	------

GLEN PARVA.—Accepted for the erection of six small villa residences, for Mr. W. H. Simpson. Messrs. Simpson and Harvey, architects, Leicester:—

D. Halford and Sons, Blaby	£1,830
----------------------------	--------

KILKENNY.—For additions to workhouse, for the Union Guardians. Mr. J. F. Reade, C.E., John-street, Kilkenny:—

W. K. Cleere, Kilkenny	£252
John Dowling, Freshford	£243

LEICESTER.—For the construction of new roads and sewers on the Grange and D'Oyley Estates, for Mr. William Elliott. Messrs. Simpson and Shardlow, architects and surveyors:—

T. Philbrick, Leicester	£28,090 0 0
Bentley & Loch	8,271 2 3

LEIGH-ON-SEA (Essex).—Proposed additions to girls' school, for the Leigh-on-Sea School Board. Mr. Frank E. Smee, architect, 12, West Smithfield, London, E.C. Quantities by Messrs. Goodchild and Son, 81, Finsbury-pavement, E.C.:

Watts and English, Southend	£1,451
Davey and Sons, S. Ockendon	1,295
A. E. Symes, Stratford and Southend	1,285

LONDON.—For alterations at "The Caledonian Tavern," Stoke Newington-road, N. Mr. Herbert Riches, architect, 8, Crooked-lane, King William-street, London, E.C. Quantities supplied:—

P. Hart	£23,320
C. Deering and Son	3,189
J. C. Richards and Co.	3,150
G. E. Todd and Co.	3,147

LONDON.—Accepted for additions to the "Eagle Hotel," Snarbrook, E. Mr. Herbert Riches, architect and surveyor, 8, Crooked-lane, King William-street, London, E.C. W. Mundy:—

W. Mundy	£240
----------	------

LONDON.—For alterations and additions at No. 13, The Parade, Upper Clapton, for Mr. W. Finch. Mr. A. J. England, architect:—

Goodall	£447
---------	------

LONDON.—For additions to 23, Rockmead-road, South Hackney. Mr. John Hamilton, architect:—

Snewin Bros. and Co.	£177
----------------------	------

LONDON.—For pulling down and rebuilding the "Blenheim," Cale-street, Chelsea. Mr. H. W. Budd, architect:—

Simmons Bros.	£4,393
Prestage and Co.	4,025
Martin, Wells and Co.	3,958

LONDON.—For rebuilding the "Alexandra Hotel," Wood Green. Mr. A. E. Pridmore, architect:—

Beer and Gash	£2,697
Knight & Son	2,650
J. Tennant	2,386
L. R. Lambie	2,381
F. Waller	2,290
Kilby and Crayford	2,280

LONDON.—For erecting two blocks of artisans' dwellings at High-street, Shadwell. Mr. G. Drew, architect:—

Holloway Bros.	£210,910
Clark & Bracey	9,997
B. F. Nightingale	2,683
Calman and Sons	9,396

LONDON.—For erecting a Mission Church, Chatsworth-road, Clapton. Mr. B. Crewe, architect:—

CONTRACTS OPEN.**TO BUILDERS AND CONTRACTORS.**

The London County Council is prepared to receive TENDERS for the ERECTION and COMPLETION of a NEW BOTHY and ALTERATIONS to CONVENIENCES at Parliament Hill, and the ERECTION and COMPLETION of a NEW CART SHED, BOTHY, OFFICE, &c., at Southwark Park.

Persons desiring to submit Tenders may inspect the drawings and obtain the specifications, bills of quantities, form of Tender, and other particulars, at the Architect's Department, County Hall, Spring-gardens, S.W., upon payment of the sum of Ten Shillings for each set of particulars.

This amount will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the Tenderer, provided he shall have sent in a bona-fide Tender and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions therein must be strictly complied with.

The Contractors will be bound by the contract to pay to all workmen (except a reasonable number of legally-bound apprentices) employed by them wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the Contract by way of schedule.

Each Tender is to be delivered at the County Hall in a separate sealed cover, addressed to the Clerk of the London County Council, and marked "Tender for the Erection of a Bothy, &c., at Parliament Hill," or "Tender for the Erection of a Cart Shed, &c., at Southwark Park," as the case may be.

No Tender will be received after TEN a.m. on TUESDAY, SEPTEMBER 27th, 1898.

Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,
Spring-gardens, S.W., Clerk to the Council.
September 3rd, 1898.

COUNTY of SOUTHAMPTON.

COUNTY LUNATIC ASYLUM, KNOWLE,

near FAREHAM.

EXTENSIONS, &c.

CONTRACT No. 3.

TO STEAM AND HOT-WATER ENGINEERS.

Persons desirous of TENDERING for the SUPPLY and FIXING of THREE High-Pressure LANCASHIRE BOILERS, ECONOMISERS, CALORIFIERS, RADIATORS, and HOT-WATER MAINS, together with all the necessary Pumps, Valves, &c., required in the centralisation and increase of the heat and power generating plant at the County Lunatic Asylum, Knowle, Fareham, may obtain copies of plans and specification of the scheme and any other information on application at the Office of Mr. W. J. TAYLOR, County Surveyor, The Castle, Winchester, between the hours of NINE a.m. and FIVE p.m. (Saturdays, between NINE a.m. and ONE p.m.).

A deposit of one Ten Pound Bank of England note will be required for each set of plans and specification. The deposit will be refunded on the return of the plans and specification, together with a bona-fide Tender.

Tenders, strictly in accordance with forms supplied by the County Surveyor, to be delivered to me on or before OCTOBER 11th next.

The Committee do not bind themselves to accept the lowest or any Tender.

JOHN R. WYATT,
Clerk to the Committee and Visitors.

TO BUILDERS AND CONTRACTORS.

The London County Council is prepared to receive TENDERS for the ERECTION of TWO BLOCKS of DWELLINGS to be known as Benson and Abingdon Buildings, respectively, on the Boundary-street area, Bethnal Green, and also for the ERECTION of COTTAGE DWELLINGS at Brook-street, Limehouse.

Persons desiring to submit Tenders may inspect the drawings and obtain the specifications, bills of quantities, form of Tender, and other particulars at the Architect's Department, 17, Pall Mall East, S.W., upon payment of the sum of £5 in cash in each case.

These amounts will, after the Council or its Committee has come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide Tender and not have withdrawn the same.

Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. As regards all work to be done at the sites, or elsewhere within a radius of twenty miles from Charing Cross, the contractors will be bound by the contract to pay to all workmen (except a reasonable number of their legally-bound apprentices) employed by them wages at rates not less and to observe hours of labour not greater than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule.

Tenders are to be delivered at the County Hall in sealed covers addressed to the Clerk of the London County Council, and marked "Tender for Benson Buildings," "Tender for Abingdon Buildings," and "Tender for Brook Street Cottages," respectively.

No Tender will be received after TEN o'clock a.m. on TUESDAY, OCTOBER 4th, 1898. Any Tender which does not comply with the printed instructions for Tender may be rejected.

The Council does not bind itself to accept the lowest or any Tender, and it will not accept the Tender of any person or firm who shall on any previous occasion have withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

C. J. STEWART,
Spring Gardens, S.W., Clerk to the Council.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"Iowa" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

The Cremation of Sewage.

ARCHDEACON SHERINGHAM'S letter on sewage disposal has called forth a lengthy commentary on the subject by "Non-Pollution," who has written to *The Times* as follows:—"Your correspondent, Archdeacon T. W. Sheringham, Canon of Gloucester, calls attention to the failure of our present methods of sewage disposal in England and the scandalous pollution of our rivers and sea coast, and pleads for 'the erection of huge furnaces at the outfalls of our drains' and the cremation of sewage. No one who travels in England can fail to agree with Archdeacon Sheringham as to the disgraceful state of things at present, or withhold sympathy with him in his desire to render the rivers and sewage farms more pure and less offensive. But the improvement of these matters is not a simple problem, but one calling for much study and special knowledge, as will at once be apparent from a consideration of the circumstances under which the existing conditions of our rivers and sewage farms have grown up. So far back as 1875, when the Public Health Act of that year was passed, the disposal of the sewage of our towns was sufficiently important to call for legislative action, and in the following year the Rivers Pollution Prevention Act of 1876 was passed, under which Act, no one, neither a sanitary authority dealing with the sewage of a district nor a private manufacturer dealing with the trade waste of his business, was allowed to discharge any polluting matter into a stream unless he could show that he was using the

'BEST KNOWN AND AVAILABLE MEANS

of rendering such polluting matter harmless.' Here we find an authoritative admission of the difficulty to be overcome, and a loophole of escape for an offender which has naturally been made the most of during the past twenty odd years. But the Government of that day, recognising how real were the difficulties to be overcome, appointed a special Commission to investigate the subject and assist with advice, which they did in a report issued in 1881. In that report, the Commission having ascertained the very great intricacy of the problem and the insufficiency of our scientific knowledge at that time to deal satisfactorily with it, declined to fix any definite standard of purity which should be legally considered unpolluting, and uncertainty and considerable variability on that point exists to this day. The only practical result arrived at by that Commission was that no treatment of sewage by chemical precipitation and filtration was good enough to give an effluent sufficiently pure to be discharged into a stream, but that the safest method of purifying sewage was to irrigate land with it, trusting to the nitrifying action of the micro-organisms in the soil to dispose of the nitrogenous organic putrescible matter in the sewage. This rather vague and uncertain finding of that Commission has formed the basis of what may now be considered as the law in England, viz., that all sewage be treated on land before it can be allowed to flow into a stream; hence the universality of the sewage farm. At the time this ruling of the Special Commission was published the action of the bacteria in different soils had not been carefully or sufficiently studied; it had not been considered how slow this action is under natural conditions at different seasons of the year, even in suitable soils, and how practically useless such treatment is on many soils. The elements of

FAILURE BY LAND TREATMENT

are too numerous and too important ever to make this method a safe and satisfactory process of sewage disposal. The unsuitability of the soil, the great difficulty of proper and even distribution of the sewage, the fall of the temperature below 37° F., when bacterial action is practically suspended; all these are elements of failure, which are more than sufficient to account for the state of our sewage farms, which, as Archdeacon Sheringham points out, are, in most cases 'miserable subterfuges.' Though the sewage farm, in 99 cases out of 100, may be admitted to be a failure, we see

there was some good reasons for its adoption, and in principle it is sound. Can as much be said for Archdeacon Sheringham's suggestion of huge furnaces in which to cremate liquid sewage, and is such treatment likely to effect the object sought for—viz., the purification of our rivers? Any one who has had experience of the evaporation of sewage, or even the burning of dry-pressed sewage sludge, knows what fearful offence is caused. Such works can be felt for half a mile at least. The nuisance could, no doubt, be minimized by the construction of lofty chimneys and the use of chemical ingredients as suggested, and the introduction of scientific and costly destructors, but will not the great cost of such treatment prevent its being used or enforced? To hang a man for sheep-stealing is not the readiest way to put an end to the stealing of sheep, it would in these days only make it impossible to get a conviction; and, in the same way, to make

THE COST OF THE SEWAGE PURIFICATION

practically prohibitive would make it impossible to put pressure on an offender. The difficulty of enforcing the law would seem to be great enough now when our large cities like Manchester, Salford, Leeds, Bradford, and others, are allowed to continue to pollute because the sums of money involved in purification are so great, and the influence brought to bear to avoid such heavy outlay is so powerful. I fear the only effect of Archdeacon Sheringham's suggestion would be that, while the water of our rivers and the land of our sewage farms remained polluted much as at present, we should in addition foul our air as well. To put a stop to the scandalous pollution of our rivers is perfectly feasible, and to do this at such a trifling cost as shall afford no excuse for non-performance of their duty on the part of any sanitary authority, or the non-enforcement of the law on the part of any county council or river authority, is also within easy reach, and it is to be hoped that the Royal Commission now sitting to consider this very important subject will, in the light of the knowledge of to-day, give a more certain sound than could be obtained in 1881. The principle laid down by the Commission in 1881 was correct. Sewage can practically only be purified

BY MEANS OF MICRO-ORGANISMS

as proved and designed by Nature; but to suppose that man may convert millions of pure water, stored and collected for the use of crowded communities, into foul sewage, and then on whatever land may be within reach reconvert this into pure water again, is to expect too much. The requirements of civilized man have created certain artificial conditions which can only be met by corresponding artificial treatment, but the law of Nature need not be transgressed or departed from. In the working of Nature it will be found that the purification of sewage on land is effected only in the upper few inches of the soil where air in the necessary quantities can penetrate, and that the land itself must be open and porous, and under such conditions the area of land required must be large, and the distribution of the sewage on it must be regular and even. Now, if an artificial filter be prepared in which the interstices in the filtering medium be sufficiently open to allow a free passage of air, and the sides of the filter be made porous so that air can enter throughout the entire depth of the filter, we have the same condition as Nature works with, only the operation, instead of being confined to the upper few inches, can be continued through a depth of many feet, thus enabling the area of treatment to be greatly curtailed, whereby accurate distribution of the sewage can be effected at little expense, artificially warmed air can be supplied in winter, and all the conditions of Nature can be complied with. The operation of such an aerated bacterial filter as above described has been tested for a considerable time at the sewage farm at Hendon on the Brent, within an hour's drive of London, and should be seen by all those interested in the non-pollution of our rivers."

"NOISOME EXHALATIONS."

A second letter on the subject utters a protest against sewage farms. "Cheltonian,"

writes:—"Archdeacon Sheringham, in his letter, hits the nail on the head when he says that the turning of fair streams into foul drains is 'not only a hideous blunder but a hideous crime,' and he drives it home when he calls attention to the 'miserable subterfuges' called sewage farms, which 'at their best result in the spread of noisome exhalations over fair fields instead of fair rivers.' Let me take an example in the archdeacon's own county, viz.,—the town of Cheltenham. By means of its sewage, Cheltenham has partially surrounded itself with hundreds of acres of land which has become simply rotten through excessive saturations with foul liquid, and the various brooks running ultimately into the Severn (of the state of which the archdeacon complains) are nothing more or less than open sewers. Various landowners and farmers, for the sake of individual gain, have from time to time either sold their land to the Cheltenham Corporation or allowed it to be used for irrigation purposes, whilst their neighbours—and especially the poorer classes—have, without compensation, had the air which they breathe polluted, and in some cases their water supply contaminated. And this, forsooth, is done by the sanitary authority of a town calling itself a health resort! There are, no doubt, other towns worse than Cheltenham, and it seems certain that, if Parliament much longer allows corporations and manufacturers to go on acquiring as it were prescriptive rights to pollute the fields and streams of England, the evil will have grown beyond control. In the meantime, Archdeacon Sheringham has done a public service by calling the attention of our legislators to it. There are many of us who would prefer that the attention of Parliament should be directed more to the social welfare of the people and less to political quackery."

THE chancel of All Saints, Bristol, has recently been restored. The alterations to the chancel have been well carried out. The roof, which for some time previously had been in a somewhat dilapidated condition, has been entirely re-erected with beautifully carved oak, and the walls on either side have been thoroughly restored. Another feature of the work is the large window that has been made in the tower wall, this having been carried out with a view to the organist being more in touch with the choir. The organ is at present also in the repairers' hands, it having been resolved to thoroughly overhaul the instrument.

In the course of the excavations for the new main drainage works in Dublin, some finds of antiquarian interest have been made. There is in the old records of Dublin, mention of a supply of pipe-water to the city as early as the twelfth century, and notifications have been brought to light of the prices charged. There were no taps or stop-cocks. The water appears to have been constantly running, and the price was a sort of rent, the amount of which was regulated by the diameter of the pipe, "the breadth of a quill" being apparently the unit of measure. In the course of the excavations in Patrick Street, the pipes of these ancient waterworks were discovered. They were made of rough beams of oak, squared, and a foot or more in thickness, and of various lengths, with a three-inch bore, which appeared to be burnt through the log. The ends of these rude pipes were fastened by iron couplings. In Upper Ormond quay, at a depth of 18ft. below the surface, the workmen came upon boats. The boats were of different sizes, and were built of oak on a strong oaken frame, the peculiarity of their construction being that there were no iron fastenings, the timbers being fastened together with nails made of hard oak. In every portion of the city where the excavations were made, small clay smoking pipes were found. These are what are known as "Danish pipes." They are, however, assigned to the time of James I. They are only two or three inches in length, with a small bowl, into which the little finger would scarcely fit.

Surveying and Sanitary Notes.

FOR some time past Messrs R. H. Dorman and Henry Shillington, civil engineers, have been conducting experiments at Portadown in the treatment of sewage by a new and novel system of filtration. It is now about twelve months since the first experimental filter in connection with the septic tank at Obin Street depot was laid down. During dry weather nearly the whole of the sewage reaching the works is passed through the septic tank, when the solid matter contained in the sewage is thrown into solution by the agency of micro-organisms, and the sewage is thus brought into a suitable state for passing through the filter beds.

THESE beds are, however, very small and shallow, while the material contained in the bottom layers is too coarse, and, as a consequence, the best results are not produced, the filtrate discharged from the beds being faintly coloured, while there is a perceptible smell from it. Still the results obtained from this simple process are wonderful. The sewage is delivered daily into the tank, and the effluent discharged into the two small filters alternately, and finally discharged into the Corcain River in a clarified condition, and in a totally different state from the crude sewage which formerly entered the river. These experiments have been carried out at a very small cost, and for a very little further expenditure the works can be made capable of dealing with the whole of the dry weather flow, and a filtrate discharged into the river nearly equal in quality to the river water itself. A committee of the Town Commissioners has been appointed to watch the results that are being obtained, with power to expend a small sum on the laying out of the ground and the enlargement of the filter bed area.

THE Sanitary Committee of the Bradford Corporation have just now in hand an excellent work. It is the abolition of slums. The Medical Officer of Health has declared a considerable area on the west side of Westgate as insanitary, and under the Housing of the Working Classes Acts the Corporation have power to demolish the property condemned. In awarding compensation to the owners, account is taken of the fact that the property is insanitary, deduction is made if overcrowding has occurred, and, moreover, the usual 10 per cent. for compulsory purchase is not allowed. The legislation affecting the question attaches much importance to the report of the Medical Officer of Health, and if the Corporation should decline to take action it would be possible for ratepayers to petition the Local Government Board. However, there seems no reason to doubt that the Sanitary Committee has the welfare of the city at heart, and its action so far certainly gives promise of good work in the future. It may be noted that it often happens after condemnation of an area in this way the improved dwellings are let at rents which are too high. The Sanitary Committee contemplate the erection of through houses in substitution, which will be let for 4s. 6d. per week.

At the Berkshire Petty Sessions at Newbury last week, the Thames Conservators took proceedings against the Newbury District Council for an alleged pollution of a stream in the parish of Donnington, the same being a tributary of the River Thames. In support of the complaint two Conservancy inspectors and Professor Groves gave evidence, the latter proving that the water taken from the stream in question was badly polluted with sewage matter; indeed, far above the average. In defence, Mr. Pinniger said the district council had been doing their best to remedy the evil, but had met with a number of obstacles. They had employed an engineer, who had prepared a scheme, but the council had been unable to obtain a site for a pumping station, and it seemed likely they would be driven to

put compulsory powers in force. The justices said they were of opinion that the complainants had made out their case, and therefore the district council must pay a penalty of £3 and £5 costs. The justices said they considered the conservators should give a longer notice than three months.

In the blue-book just published, containing a report of Mr. W. N. Shaw, F.R.S., to the Local Government Board, on the ventilation and warming in certain of the Metropolitan Poor Law schools, to which we refer elsewhere, the author states that he has kept in view the intimation contained in the letter of the Local Government Board, dated Jan. 4th, 1897—namely, that it was proposed to cause the inquiry to be made "with a view to obtaining practical suggestion for the improvement, where necessary, of the ventilation and warming of each type of room in each of these schools in such form that general principles might be laid down in respect of such types, to which the guardians or managers to whom the schools belong might give effect, with the assistance of their respective architects." The various aspects of the problem of ventilation and warming are fully considered, and plans and tables are furnished to illustrate the text and make it clear in its technical bearings. Recommendations are given at the end of each section as to the best means of ventilation and warming for adoption in the various apartments of the institutions under consideration.

THE chairman and the members of the sub-committee of the Leeds Corporation, under whose direction the meat market and abattoir are being erected, have visited Birkenhead and Birmingham for the purpose of inspecting the overhead gearing at the meat markets and abattoirs in these towns before making a final selection. They had an opportunity of seeing in operation the latest improvements in overhead gearing, which have only been adopted within the past few weeks, and they were very favourably impressed by what they saw. Tenders are now invited.

THE law calls upon the owner of a house, and not upon the tenant, to open and clear choked drains. If the drain has collapsed, the owner does not grumble at being required to rectify the mischief, but he finds it hard when, as in a recent case in Liverpool, he is required to bear the cost of restoring to the negligent tenant an umbrella, a broom, and a Bible. Another grievance on the part of houseowners as against careless tenants is found in the tearing of lobby papers and plaster by means of bicycles especially and bassinettes generally, the pedals of the one and the wheels of the other being very destructive. An elastic, or at least a wider, lobby may be found in the house of the future, but only care will prevent damage in the house of to-day.

THE Town Council of Retford has received the formal sanction of the Local Government Board to the borrowing of £40,000 for carrying out a sewage scheme.

A PIER of the Ottawa and New York Railway bridge over the St. Lawrence River fell recently, carrying two spans. Thirty workmen were killed and twelve injured.

THE Stockport Corporation is about to make an effort to acquire the property of the Waterworks Company which supplies Stockport and a surrounding district, in which the total population is over 200,000.

MESSRS. BELL, of Liverpool and Nottingham, the contractors for making the new railway bridge across the estuary between St. Issey and Padstow, have succeeded in reaching to the foundation in the fourth and last cylinder in over 54ft. of mud, below low-water mark. This work has entailed a considerable amount of labour, skill, and anxiety, both by night and day, and entailed the use of special machinery to carry it out.

Builders' Notes.

THIS is an exceptionally active era of bridge re-building on the Thames. Vauxhall, Lambeth, and Kew bridges are coming down, to be replaced by others more suited to the enormously increased traffic of these later years; while already, within the last decade, Battersea and Putney bridges have been reconstructed. It is now being discovered that the old bridge at Richmond is too narrow and has too steep a roadway for the very busy suburban traffic, including lines of omnibuses which now cross the Thames at this point. Preliminary discussions are arising about the expediency of replacing it with a newer and more commodious edifice. The existing bridge was built between 1774-7, and, architecturally speaking, is a fine and interesting object in the river scenery, so that a proposal which has been made locally to build a new bridge rather lower down the river and to preserve the old one as a promenade is rather a happy one.

WILLIAM WHITE MORGAN, carpenter, was killed at Newport on Saturday week by being impaled on iron railings. The deceased was assisting another joiner in fixing in place a large piece of timber to support rafters on the roof of the extension to the Alexandra Dock Hotel, Newport. Cann, the other joiner, was standing on the top of a wall a brick and a-half thick, holding one end of the piece of timber known as the purlin, the other end resting on another wall 20ft. away. He had the end on his shoulder, and asked deceased, who was on the scaffold 3ft. below the top of the wall, to cut a length of strut shorter, as the one put in was too long. Then Cann took the shorter piece and held the notched end to the purlin, directing deceased to knock away the longer strut, and to be very careful about how he did it. Deceased used the 2½lb. hammer too vigorously, or the strut was not fixed as he supposed, and he lost his balance and fell backwards as the strut came out. The drop was 28ft., and deceased fell on his chest on to iron railings, three of the spikes of which penetrated his body and killed him almost instantaneously.

THOUSANDS of Londoners have gazed inquiringly at the curious structure that has been slowly emerging from the Thames at Charing Cross during the past four months. The structure is connected with the forthcoming electric railway from Waterloo to Baker Street. The fact is that one of the excavating stations of the electric railway is to be formed in the river at this point almost under the shadow of the South-Eastern Railway viaduct. The sinking of piles for the staging began about Whitsuntide, and the timber frame structure, which is 226ft. long by 50ft. broad, is now nearing completion, being surmounted by a derrick and two steam cranes. It projects at a right angle from the first pier of the railway bridge in a westerly direction, and is parallel to the Embankment. From the centre of the staging a caisson will be sunk, and by its means the excavation will be carried on, and the iron-work for the electric line will be conveyed below the surface. As the work is estimated to take five years, the public will have ample time to grow familiar with the somewhat ungainly structure that is now one of the most prominent objects at this part of the Thames. There are, of course, certain advantages in the site from an engineering point of view. For instance, the excavated material can be conveyed directly to barges alongside the staging. The work is entrusted to Messrs. Perry and Co., of Tredegar Works, Ordell Road, Bow.

THE Maidstone Corporation is inviting plans for a combined scheme of electric lighting and dust destruction for the borough. The idea is to utilise a portion of the Lock Meadows as a site for the electric lighting station and dust destructor, and to erect stables, &c., for the Town Council's horses and appliances on the same spot.

MASONRY.

By JAMES WILDING.

(Continued from page v.)

No. VII.—TRACERY WINDOWS.

BEFORE a mason can hope to grapple successfully with the work entailed in setting out tracery windows he should be familiar with plane geometry. Often is a well designed window spoiled because the setting out is faulty. Very accurate squares and trammels are needed for the work on the large drawing board—a very slight error soon becomes much magnified by repetition. Usually the drawing supplied by the architect is one to the scale of one-twelfth, and is nearly always drawn completely—it has often been

should be treated as though it was the voussoir of an arch, and the beds placed parallel to the joints. In all laminated rock this is very necessary. The mullions are usually set with the beds to the reveal—if set on the natural bed the expense of working is much greater—the result is, however, more satisfactory.

The example chosen to illustrate this article is a simple one. The window has, as its underlying construction, three circles placed inside one circle. This is shown as follows: Divide the circle A, B, A, into six equal parts, viz., A, 1, 2, B; 3, 4, A; produce 2 4 indefinitely in length; produce a line from point A to the right horizontally to cut 2 4 in C.

Bisect this angle as follows, with C as centre and any distance, in this case CK, describe the arc KF, with F as centre, radius KF, describe KM, with K as centre, radius KF; describe FN, intersecting KM at R; produce line from

i.e., must give the same result when applied from either face. Nearly every mason will differ slightly in the way of working—the essential point aimed at in each case is accurate squaring through of the face mould which gives the containing lines. The “nose” lines are put on by means of straps or are “trammelled” round, where this can be done with advantage. Much nicety is required with the mullion mould as it is carried round, the grooving for the lead lights needing very delicate handling.

A very useful guide to masons when working a large window, required to be as much as possible on its natural bed, is to place the large scale drawing in the shed, with each stone lettered and numbered on the drawing.

All tracery windows have to be “handed,” i.e., the right and left hand side have to be worked to suit their respective positions. Usually the method of working is to work with the “line-up” (i.e., the nose lines and cusp lines) for one side and “lines down” for the other. A little examination of the window used as an example will make this matter clear.

(To be continued.)

SKETCHES OF FACE MOULDS IN POSITION TO NATURAL BED.

Trade and Craft.

DUCKETT'S SLOP-WATER CLOSETS.

Some time ago the Lincoln Corporation gave notice to an owner of property to remove several of Duckett's slopwater closets, and to substitute closets which entailed the use of Corporation water. It was alleged that the existing closets were not sufficiently water-closets and were insanitary. The owner declined to comply with

observed by men who have to make the working or full-size drawings that if one-half was left so as to show the generating lines many mistakes and much time might be saved. On a smooth well-chalked board the window is set out full size—that is one-half fully, and so much of the central portions as are needed. The positions of the joints are then decided upon and so arranged that each joint is directed from the point which is used to describe the arc of the circle from which it starts—it often happens that two or more circles will be intersected by a joint—hence it is seen by examining the simple example shown that the striking points of the various curves are also the points to which or from which the joints should be directed. The occasions where the joints are not so directed are very rare indeed. The forms of traceried windows are very varied. It should be clearly understood that they all have a geometrical basis. The triangle and polygons with the circle are the main underlying structural features.

To set out a tracery window well the following simple directions will be found of much value:—

(1) If the window is a very large one, a drawing made to, say, the scale of one-sixth or even one-fourth full size will give greater facility for the study of constructional difficulties.

(2) The production of such a drawing will fix in the mind of the setter-out the geometrical forms underlying the design.

(3) The said enlargement submitted for the approval of the architect with the joints marked thereon will settle any difference of opinion there may be as to joint position.

(4) The enlargement to full size is a simple matter calling only for extreme accuracy. Many set out the centre line of each nose, and allow them to form the network of the design.

(5) One-eighth of an inch should be allowed for joint room.

All dowels should be of slate or copper.

All joints should be grouted with cement. Wherever a trammel can be used for fixing purposes it should be so used.

The vexed question as to the position of the natural bedding of stone in tracery is always to the front. Many hold—and rightly so—that so far as is possible each piece of tracery

TRACERY WINDOWS.

C through R, to cut centre line of main circle at S. S A is the radius required.

Mark the centre of the main circle with the letter E, with E as centre and E S as radius; set off V W on lines 2, 4, and 1, 3 respectively. With the centres S V W describe the three circles, which should just touch, but should not cut each other. By careful examination of the figure, the joint line will be easily followed. The left hand side shows the face moulds only. The stone is sawn to a proper thickness, and the several moulds arranged on the “tooth” of the slab, so that waste may be avoided. The sketches show the face moulds applied to the slab, with the direction of the natural bed indicated in each case. Great care must be taken in squaring the lines through from face to face—the square must “turn”—

the notice, and the Corporation therefore carried out the work, charging £17 as the cost thereof. Payment was refused by the owner, and an appeal was made by him to the Local Government Board. A local inquiry was held in March last, and evidence taken by the inspector. The decision of the Local Government Board has now been given, and an order has been made that the owner be not called upon to pay the charges of the Corporation or any portion thereof, and that the Corporation pay the Local Government Board's costs in the matter. The closets referred to were examples of Duckett's well-known patent closet arrangement B. The Local Government Board evidently considers this closet is sufficiently sanitary for outside use in connection with cottages.

VENTILATING AND WARMING SCHOOLS.

THE Local Government Board has just issued an elaborate report by Mr. Wm. N. Shaw, F.R.S., of Emmanuel College, Cambridge, on ventilating and warming in certain Metropolitan Poor Law Schools. It gives the opinions of an expert on both questions; and we, therefore, give some passages of general interest. He first lays down the

GENERAL PRINCIPLES upon which his criticisms are based. First, as to the amount of air required for ventilation. Since the rooms can be thoroughly aired by opening the windows fully in the "recess," after about an hour's use we may restrict the amount of air to that required for keeping the air within the limits of respirable impurity for an hour. This consideration enables us to reduce the supply from that required for ventilating with a view to continuous occupation in the ratio of two to three. Dr. de Chaumont fixed it at 2000 cubic feet per hour for an average audience. If we allow some deduction on account of the members of the audience in our case being smaller than the average, we may, perhaps, put down 1500 cubic feet per hour per child as the amount required. Dr. Carnelly, in his "Report on the Heating and Ventilation of Schools," wherein he supported the view that

MECHANICAL VENTILATION by propulsion is the best method in practice for ventilating schools, quoted quantities between 800 and 1400 cubic feet of air per head of accommodation as supplied by mechanical arrangements in good order at certain schools reported upon, so that 1500 cubic feet per hour would seem to be a good allowance. This allowance per head implies, however, an enormous flow of air through the windows or other openings by which air is supplied for ventilation. We require for classrooms more effective cross ventilation, and a greater window opening than in the case of dormitories. At the same time there is need for quite as great, or even greater, care to protect the children against draughts, for they are more exposed to the cold than when they are under the bedclothes. It is not, therefore, a matter for surprise that when schools are to be ventilated, the mechanical method, by which a certain definite volume of warmed air can be delivered where it is wanted, should gradually gain ground as the most effective method of

SOLVING A DIFFICULT PROBLEM. As regards temperature, Morin gives 59 deg. F. as the proper temperature for schools. Some latitude may be allowed, but the temperature ought not to be allowed to fall below 57 deg. F. In order to maintain the temperature, closed stoves, open fires, fires with fresh air supply, hot water pipes, steam pipes, or steam radiators, are used in different school-rooms. Closed stoves cannot be regarded as a permissible form of heating for rooms that

require warming and ventilating for a number of persons distributed more or less uniformly over the whole floor space. Their numerical efficiency as warming agents is very high, but they afford very little assistance to the ventilation. The most serious practical difficulty arises when the warming has to be combined with ventilation for a large number of persons. All the air inlets are cold. The stove distributes most of its heat by combustion, the direct heating is very local, and is associated with a rapid upward current of very much heated air all round the stove. The cold incoming air reaches the stove by coming through floor ventilators, or by dropping down to the floor and moving along it towards the vertical rising column round the stove. Before it becomes warm it has already performed its ventilating. There is, therefore,

NO SATISFACTORY DISTRIBUTION OF HEAT and air together. A room heated by closed stoves is always close if it is warm. Open fires are themselves very active ventilators; they are unsuitable for warming and ventilating rooms occupied by a large number of persons, because they distribute their heat mainly by radiation, and in a schoolroom it is practically impossible to distribute the desks so that each occupant gets an equal share of the radiation. The ventilating grates with fresh air supply afford considerable improvement, if the supply of warmed air can be successfully distributed over the room. The warmed air naturally rises at once to the ceiling, and there is danger of its passing into extract flues without having been used. In a room warmed by an open fire there is an upward current of air near the grate rising to the ceiling and passing along it. The warmed air from behind the grate should be delivered into this current. The system is very much disturbed when a room is lighted by gas jets unprovided with separate flues, for in that case a reservoir of air

VITIATED BY THE GAS collects at the ceiling and must find its way out at the top of the room, otherwise the whole air of the room becomes very heavily loaded with impurities due to the gas. To deliver warmed fresh air into this reservoir of heated and vitiated air is simply to waste it. It is from this point of view an advantage to have the amount of air delivered from behind the fires as large as possible and only slightly warmed, and to have it delivered not higher than the top of the grate. One open fire will provide ventilation for about fourteen children in a classroom under the conditions indicated. A good deal of supplementary ventilation will therefore be required in the way of cross ventilation, where a classroom for sixty children has only a single open fire. Hot-water pipes and steam pipes distribute the heat satisfactorily, and they diffuse the air of the room by the local air circulation which they produce, but, as applied to schoolrooms, they are open to the objection that of themselves they give rise to so little head for ventilation that it is difficult to get the necessary amount of air through the rooms.

FELLING A CHIMNEY.

A HUGE, solidly built, circular chimney, some 80yds. high, and containing, on a rough estimate, about 3500 tons of bricks, has just been razed to the ground at Preston. There is something fascinating in the spectacle of a big building, which has taken perhaps several months to erect, being levelled to the ground in as many seconds. The work of felling this huge stack had been entrusted to the renowned "Lancashire Steeple Jack," Mr. Joseph Smith, of Rochdale, who has had a unique experience as a repairer, straightener, and feller of chimneys. Of course, a good deal of careful preparatory work is necessary before the coup de grace is given which brings the towering giant to the earth. On Monday week Mr. Smith's experts and the contractor's workmen began the process of cutting away a portion of the base of the chimney stack and inserting stout timber props, which, at a given time, are to be burnt away, with the result that the chimney collapses. The principle is simplicity itself, but its application requires the exercise of great skill and judgment, and the nerve and control of a master mind. The great gap cut in the bottom of the stack was neatly filled with 160 props, 5ft. 6in. long, 6in. wide, and 6in. deep. The combustibles employed consisted of 6½ tons of coal, four tons of coal pitch, four barrels or 168galls. of tar, three barrels or 126galls. of paraffin, 40 bags of shavings, and 6 tons of firewood—material for quite a respectable bonfire. Mr. Smith had arranged that the chimney should fall along a vacant plot of land in the direction of Strand Road, and a rope was carried round this enclosure. The chimney had

CANTED DURING THE UNDER-PINNING. Its declination from the perpendicular was, of course, infinitesimal and undiscernible, but Mr. Smith pointed out some slight, almost microscopical, rifts in the mortar joints at the back of the square base of the chimney, which told their tale to the practised eye. When the match is applied the flames spread with amazing rapidity; the combustibles crackled and roared fiercely, and dense volumes of smoke rolled to leeward. Mr. Smith remained behind, intently watching the progress of the fire, and feeding it continually with bucketsful of paraffin. The flames mounted higher and the furnace roared with redoubled fury. Ten minutes had elapsed. The steeplejack went round to the rear of the chimney and minutely scrutinised the surface. He listened for the characteristic "groan"—weird sounds which echo in the chimney, and which announce that the structure is about to collapse. A few more bucketsful of paraffin are dashed into the furnace. A few more moments elapse, and then the huge structure topples, and with a grinding crash descends to the ground along the track prepared for it by the "steeplejack."

THE Hampstead Guardians have accepted a tender for £1025 for fitting up their work-house with the electric light.

Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

GILLOW AND CO.

(Waring and Gillow, Ltd.),

406, OXFORD STREET, W.

(Established at the above address over 100 years),

HAVE a large and most desirable selection of all the best Shooting, Fishing, Hunting, and Winter Quarters in the Market, and will be pleased to submit a list of same free on application. Telephone No. 30, Paddington.

BERDEENSHIRE (24,158).—An excellent SHOOTING BOX, very nicely furnished, modern sanitation. The accommodation includes eleven bed rooms (making up fifteen beds), large nursery, bath room, w.c.'s and lavatory, and four reception rooms. Complete domestic offices. Three-stall stable, coach-house, harness room, loft and rooms over. Well laid out grounds, with two tennis lawns. Greenhouses and kitchen garden. September and October, 100 guineas inclusive.

BERKSHIRE (3122).—In lovely scenery, looking on the Downs and extensive Commons close at hand. In 3 acres of grounds, well timbered on all sides except the south, to which the house fronts. Contains dining room, drawing room, kitchen, three large bedrooms, one smaller; store cupboards, larder, &c. Stabling for three horses. Trout fishing in River Embourne, also good winter fishing. Shooting to be had in the neighbourhood. Plate and linen nearly new. Comfortably furnished.—Terms and full particulars as above.

South Foreland Estate, St. Margaret's Bay, two miles from Martin Mill Station, a little over two hours from London, five miles from Deal, and four from Dover.

MR. F. G. WHEATLEY has been instructed by the National Land Corporation (Limited) to offer for SALE by AUCTION, in a Marquee on the Estate, on THURSDAY, OCTOBER 6th, 1898, at 2.30 p.m., 97 plots of FREEHOLD BUILDING LAND, suitable for the erection of marine villas and bungalows of every size. The estate occupies a splendid position on the verge of the cliffs, and commands magnificent views over the Channel and Goodwin Sands. The climate is bracing, rivalling that of Margate. Good boating, fishing, and bathing. Arrangements have been made with the East Kent District Water Company to supply the estate with a constant service of pure water. No law costs, good roads, free of tithe and land tax. Payments by instalments extending over ten years if desired. The sale will be preceded by a luncheon at 1.30. A special train leaves Holborn at TEN a.m. on the morning of sale. Tickets 5s. each.

Particulars, plans, and conditions of sale may be obtained of the NATIONAL LAND CORPORATION LTD., 18, Adam-street, Adelphi, W.C.; and of the AUCTIONEER, 263, Strand, London, W.C.

Woking, Surrey.—Coxhill-green Estate, situated on rising ground, 1½ miles from Woking Station, from which there is a splendid train service to Waterloo.

MR. F. G. WHEATLEY has received instructions from the National Land Corporation (Limited) to offer for SALE by AUCTION, in a Marquee on the Estate, on MONDAY, OCTOBER 10th, 1898, at Two p.m., about 20 PLOTS of FREEHOLD BUILDING LAND, suitable for the erection of detached residences of a superior class. Payments by instalments, extending over 10 years (if desired). Deeds free of law costs.

Particulars, when ready, may be obtained of the AUCTIONEER, 263, Strand, W.C.

FOR SALE.

FREEHOLD.—SANDFORD HOUSE and ESTATE, Godshill, I.W.

Six rail stations within one to four miles. Matchless beauty, splendid views and soil, mild climate, majestic, rare evergreen trees, &c.

Either as one property, or in portions to suit buyers, viz.:

1. The HOUSE, with a beautiful cottage and any portion of gardens and grounds.

2. The FARM, with 60 acres good land, part adapted for building development.

3. The BUILDING LAND, skirting the High-road to Godshill.

4. The SEVEN perfect STONE COTTAGES.

An Architectural Causerie.

The Poetry of Stairs. PERHAPS no architectural image has become so popular with poets and painters as the representation of stairs. From the rude ladder by which primitive man climbed to his "garret" or "bewareing-place" to the luxuriously-carpeted staircase down which the modern heroine sweeps in silken gown, few structural features lend themselves so well to pictorial treatment, or have been so frequently associated with poetic ideas. In the Architecture of ancient Egypt, as we know, the conception of the symbolic beauty of stairways took splendid and permanent form:—

The mighty pyramids of stone
That wedge-like cleave the desert airs,
When nearer seen and better known,
Are but gigantic flights of stairs.

In the history of religions, "Jacob's ladder" stands as the favourite expression of that idea of different planes of being, and of actual and helpful communication between them, to which, apart from all theology, humanity returns with perpetual joy. In epic and in lyric again we find the simile used to illustrate the ascent of man, and his painful gropings. "on the great world's altar-stairs that slope through darkness up to God." Then, in the realm of imaginative painting, we have Burne-Jones's "Golden Stairs"—whose construction may seem dangerous, and even impossible, to the cold professional eye, though they serve so well their decorative purpose, and give its name to the most popular of the artist's works. And passing to humbler levels of fancy and sentiment, how many memories and associations gather round the common structural necessity of stairs! Alike in life and in romance, they are the scene of some of the most vividly remembered moments in the history of the home. With such traditions as cling around it, and therefore such scope for poetic treatment in Architecture and furnishing, it is sad to see the neglect of the staircase in the average home, and the failure to turn it to picturesque account. Often, indeed, it is nothing but a straggling lumber store, a refuge for ornaments rejected by the rest of the house. Here are assembled the third-rate pictures crowded out from the living-room walls; old-fashioned diploma studies from the antique, and the young ladies' copies of Sir Edwin Landseer; hither is exiled the stuffed canary, a melancholy and moth-corrupted bird; here the sportsman of the household may display samples of his miraculous draught of fishes; here the relics of the summer holiday may linger on until the next "spring clean." Here, if there be an alcove, we shall find the condemned easy-chair, so placed between the window and the water-tap that no one would ever be likely

to engage it for an after-dinner doze. The staircase window, too, in most old-fashioned London houses, would debar any sensitive person from loitering on his upward way, being fashioned of frosted stars, with the crudest coloured squares at each corner, through which the angles of the cistern, like the charmed sea in the "Ancient Mariner," "burn blue and green and white." Happily the newer generation of architects are restoring the staircase to its former place in the structural scheme; not as a mere convenience to be grudgingly included in the plans, but as an integral and interesting feature of the dwelling, to be decoratively treated in relation to the whole. This, of course, was the mediæval ideal; and it is only during the present century (largely no doubt through the increased price of building land) that the staircase and entrance hall have shrunk to the mean dimensions they now occupy in town and suburban terraces. Roughly speaking, there are two methods of arranging the stairs. They may either rise openly out of the central hall, which itself may partake more or less of the nature of a living-room, or they may be enclosed—in the distinctively mediæval fashion—in a chamber of their own, square, spiral, or turret-like, as the case may be, and approached by an archway or door similar to that of a private room.

This method is, perhaps, the more refined and romantic of the two; but the idea of letting the staircase spring from a central hall, sufficiently sheltered and furnished as to afford a reception-room and general *salon* for the household, may commend itself to many as a more dignified and sociable way. It also gives a certain breadth and variety to the ground floor, and a pleasant sense of space above it—the qualities which one misses most in a modern "flat." In the more commonplace of the Victorian houses the staircase is an ineffectual compromise between these two plans; the entrance hall is too meagre to sustain an air of hospitality and ease, while the stairs themselves are not housed with any snugness or seclusion. The different methods of setting the treads—whether with a closed or open string—are but the carrying out in miniature of these alternative principles; and in the arrangement of them round a centre—whether wall, well, or newell—there will of course be ample scope for diversity and ingenuity of design. The main contention of the critic is that the staircase, recently neglected and abused, should be brought more within the decorative scheme of the whole dwelling, and should have shed upon it more of the spirit of hospitality and beauty which should pervade the dwelling-rooms around it. E. W.

MARKET CROSS, EDINBURGH. RESTORED BY MESSRS. MITCHELL AND WILSON

"SOME LATTER-DAY PROCLIVITIES."

To the Editor of THE BUILDERS' JOURNAL.

SIR.—The article having the part honour of your front page in last week's Journal has moved me to question the omniscience of the writer, and his conclusions and denunciations on "some latter-day proclivities."

I had some little consolation when reading it, for I realised that the writer was not at present armed *cap-à-pie* and was riding atilt at the world in general. He confines himself at first, with moderation marvellous to behold, to denunciations of "the insect which gives itself up to inordinate self-applause." I wonder who would recognise in this the harmless and most necessary barn-door fowl! From the contemplation of this "insect" destroying the "smiling peace of mind" of the hen-loft, which he informs us is so essential to the laying of eggs, he leaps with an agility, which cannot but be admired, to the contemplation of the modern architect and the "whole brood of latter-day artists."

Who the whole brood of latter-day artists are I cannot imagine from the characteristics he gives us with such lavish hand. I am completely in the dark as to their identity, yet have a vague conviction that they are some new "insect" whose fame has not come down to us.

The sincerity of his attack upon English art of to-day cannot be doubted. Yet I cannot help thinking that its great fault to him is its present tense. The ease with which he takes up the cudgels against it imply a want of sympathy with the newer ideals of to-day; and because they are of to-day, because he sees the travail of their birth, he doubts of their genuineness and sneers at their self-consciousness.

War! plague! revolution! he cries, with the abandon of a child who knows not consequences, would bring about an ascendancy, a reformation in the arts. This, no doubt, is true, but what an awful price to pay for a mere momentary flame of vigour and revival in the arts.

Enthusiasm, passion, living activity; all this would doubtless come about, but above it all would be heard the voice of wailing which could not be comforted.

His attitude here seems that of asceticism run mad. He must be reminded that there is a world of men outside the ascetics who have to go through an unchanging round of toil without the consolation of his quaint conceits.

He is in a petulant mood with to-day; it is natural enough when the great masters come before one, but he should use of that self-examination he so hates, and he would see how irrational his point of view is to a man of action.

Many reading his attack would say "Here is a writer of capability and power, but where are his actions?" Ah! indeed; where are they? Is he adding to the necessary vitality of the age?

It is always safe to kick the labouring present century; call it bad names—degenerate, unproductive, &c.; but when it is gone the mellow halo of distance transforms into beauty that which was seeming vile. This will doubtless happen to the writer, and when the twentieth century is well on its way, he will then transfer his kicks and cuffs to the new detestable present, while the old nineteenth will gain his applause.

It requires little to refute his arguments that consciousness in art is degenerate. We have only to consider the old-time giants to see how false it is. Who was more divinely conscious in his art than Shakespeare; more convinced of his genius, and conscious in his composition than Wagner. Bright, in his greatest flights of eloquence, had still some of the "tricks that speakers use"; while Raphael in his cartoons was splendidly confident of his power and completely conscious of his art. Michael Angelo in his sculpture ventured even into the grotesque in the consciousness of his genius, yet that same consciousness helped to bring about the wonderful beauty of the Giotto Tower.

It seems the writer is confusing mere common personal egotism with that wide consciousness great men must possess. The artist truly great, the writer truly superb, know each the extent of their greatness, providing always that they are sufficiently great to do so. The men on the middle rung of the ladder of genius are troubled with doubts, but the truly great have their heads above the clouds and see the heavens undulled by vapour. Having mastered that height, they have first mastered themselves, and pass to that sphere in which they know all things thoroughly, even their own genius.

This the writer must some day acknowledge if he would help in the great period of art which must one day burst upon England. He is at present a stranger to his own imperfections, which I think is but one degree less harmful than being "a stranger to his own perfection."—I am, sir, yours faithfully,

F. B.

COUNTRY COTTAGES.

CORRESPONDENCE has appeared in The Times during the last few days under the heading "Town and Country Life," dealing with the subject of the depletion of our village populations. One correspondent, a lady signing herself "Chairman of a Parish Meeting," assigns as one of the causes of advancing depopulation the lack of suitable cottage accommodation. The correspondent proceeds: "I have never yet known a comfortable cottage with a good garden that was allowed to remain empty. During the late years of agricultural depression fewer cottages have been built, and a certain number of the worst have fallen into decay and been pulled down. In very many districts the farmers and others cannot get enough men to do their work because there are no houses for them. And not only are cottages scarce, but in many country villages they are in a wretched state of neglect and overcrowding, whole families being still reared in the single bedroom, while it is an exception to find good water and sanitary arrangements. The parish councils cannot do much, for reasons that are obvious to all who are familiar with village life; and medical officers of health and inspectors of nuisances are never seen in most agricultural villages. For advice as to the appointment of these officers, and for plain facts as to the

STATE OF COTTAGES GENERALLY,

both good and bad, all over the country, see the last Blue-book, 1894, on 'The Agricultural Labourer,' to be obtained from Eyre and Spottiswoode for 2s. 1d. Village life is not nearly as dull as it used to be. Concerts, amateur plays, sports, libraries, cricket, bicycle, and workmen's clubs are now universal, as well as lectures and classes of all kinds arranged by county councils and local committees. Every village now has its post-office, and oftener than not its second delivery and telegraph. If some means could be devised for building cottages at remunerative prices the inventor would earn the lasting gratitude of country mankind, and in my opinion do more than anything else to keep the people in the country." This view is also taken by other correspondents. Mr. T. Roger Smith, of Llan-drindod Wells, is one of them, and he suggests the use of wood in cottage construction. He says: "Why not try building them of wood? We are all familiar with wooden railway stations, and now that the most serious drawback to the employment of wood as a building material—namely, its liability to burn—can be got over, is would surely be worth while to try whether the employment for the walls of a wooden framework such as the

SO-CALLED IRON BUILDINGS

start with, covered outside with good weather boarding and lathed and plastered inside, would not so far reduce the cost as to make cottage building a less hopeless investment than it now is. Such a wall is probably as warm as and drier than a one-brick wall, and with care the building would be fairly durable—e.g., the railway station buildings at Reading, which were pulled down this summer, after

standing ever since the Great Western Railway was begun, proved to be still in good condition." This idea of wooden cottages is commented upon by "A Would-be Builder and Occupant," who says: "With regard to the erection of wooden v. iron buildings as cottages, I fancy many landowners would willingly put them up if allowed to do so. Unfortunately, some district councils—that of Uckfield, Sussex, for example—refuse to permit their erection for human habitation. The reasons for disapproval are inscrutable, as from personal experience one knows them to be inexpensive, sanitary, and perfectly comfortable as dwellings." And as a cause of the lack of cottage accommodation "the inflexible and often unreasonable local by-laws" is, in the opinion of another correspondent, important. He gives an instance. "In altering part of a commodious

BARN INTO A COTTAGE

it was necessary actually to diminish the accommodation in order to comply with the requirements. One reason was that a large and airy upstairs room could not be used because, being partly in a roof, it was not 9ft. high for two-thirds of its floor space. The medical officer made a special trip to see if the by-law was satisfied as to 15ft. clear space in front and rear. There are no buildings within half a mile on two sides and a large open yard on the third. Lastly, although there only wanted a ventilator to a drain, already unduly costly, the surveyor could not give a certificate, and is now away on his holiday. Should the tenants be put in from their present inconvenient quarters, a technical offence will have been committed. Can you expect owners to build cottages when so hampered—to say nothing of the fact that they will be immediately rated for their improvements?" "W. M. A." raises an interesting point in the controversy—the thatching of roofs. He says: "One of your correspondents points out that the model by-laws of the Local Government Board prevent the erection of wooden houses. I may add that they also prevent

THE THATCHING OF ROOFS,

though, as everyone who has had the advantage of sleeping under it knows, thatch is vastly cooler in summer and warmer in winter than the flimsy slated—to say nothing of corrugated iron—roofs with which the urban wisdom of Whitehall is disfiguring our country lanes. In a close-built village the prohibition of wooden buildings with thatched roofs is at least intelligible, but the almost universal custom when a rural sanitary authority makes by-laws under the Public Health Acts is for these by-laws to be applied wholesale to the entire district. It would be a good thing if some member of Parliament, who cares for the comfort and picturesqueness of rural life, would take the matter up. If building by-laws are wanted at all for detached houses and cottages they ought at least to be drawn up from this point of view. It is absurd that rural buildings should be restrained by rules made to deal with urban or even village requirements."

A NEW girls' school and pupil teachers' centre has been opened at Smethwick. Mr. F. J. Gill is the architect, and Mr. J. Harley the builder.

THE Corporation of Aberdeen has entered into an agreement with the Rubislaw Granite Company to widen Queen's Road, at an estimated cost of £1640.

THE City Council of Liverpool has approved of plans for the extension of the City Fever Hospital, East Mill Lane, Old Swan, and an application to the Local Government Board for sanction to borrow £40,000 for that purpose.

IN reply to a question put by Mr. Parnwell, at a meeting of the City Corporation last week, the Lord Mayor promised to unveil at an early date the two panel pictures now being fixed in the Royal Exchange, and depicting "The Aldermen and Commoners Offering the Crown to Richard III." and "William the Conqueror Granting the Charter to the Citizens."

Men Who Build.

MESSRS. MITCHELL AND WILSON.

THOSE who can enjoy the spectacle of a beautiful city, rich in fine and true Architecture, and loaded with those subtle appeals which haunt the ancient habitations of man, and who have not yet made the acquaintance of "Auld Reekie," as the Scots have nick-named their capital, should hasten and make an opportunity to do so. The familiarity, "Auld Reekie," is neither just nor appropriate; it is not of the city, but derives from the country round about, whence, from afar, in clear keen air, may be seen the thin plume of smoke wafted leeward from the city's wind-scoured streets and alleys. It is not for nothing, indeed, that Edinburgh has been

These physical configurations of Edinburgh are so curious, and are so closely related to the architectural history of the place, which indeed has been largely influenced by them, that some knowledge of them is almost necessary to a right understanding of the motives which inspire the subjects of this article, who are partners in one of the best known and most esteemed of Scottish firms of architects, who live and carry on their work in Edinburgh, and who have each individually been educated and trained in the practice of Architecture amid those strong appeals of romantic traditions and a noble Art which characterise the Scottish capital. Edinburgh, it should be understood (if we except the wide-spreading suburbs which are springing up upon all sides), is of two divisions, which are as distinct in social style and in the character of their respective Architecture as they are in locality. Each of these divisions is built upon a hill which is separated from its neighbour by a considerable depression, with steeply

left lie a multiplicity of courts and alleys, "wynds" and closes, leading to more gaunt grey frontages and more perspectives of fluttering linen, with glints here and there of the fresh sky between, and of the Forth and the rolling blue country beyond. The backs and sides of these houses in their heterogeneous combinations spring up in firm, strong lines from the steep, green slopes of the public gardens, and look out across to the new town with its rolling carriages and luxurious conventions of fashion and prosperity. The old town, where poverty cowers, rambling and barren of architectural impulse, as it is for the most part, is yet essentially Gothic; but once across the Waverley bridge, where wealth and prosperity sit at ease, and every object betokens the metropolis of a cultivated and refined people, and in all these streets, squares, terraces and crescents in the Renaissance manner which lie about the broad level boulevard of Prince's Street, you shall scarce see a stone to remind you of

"BONALY," NEAR EDINBURGH. MESSRS. MITCHELL AND WILSON, ARCHITECTS FOR ADDITIONS.

called "Modern Athens" and "the Athens of the North." The visitor, widely travelled though he be, commonly admits without reservation that he knows no more inspiring and imposing spectacle than that presented by the city and its environments; and, so far, as a matter of taste and opinion can be decisively stated, it is generally laid down that, excepting only Venice, which has unique claims upon our wonder and admiration such as must ever set it alone and apart from all comparisons, and with reservations perhaps in favour of Constantinople and Athens, Edinburgh stands unsurpassed by any city in the world. Nor is the familiar comparison between the northern city and the Greek capital any mere catch-phrase, nor one of those trivial analogies which the modern fashion of globe-trotting engenders and cherishes. It is not due merely to the fact that the salient, characteristic feature of each bear such a strange likeness as do the Castle Rock and the Acropolis that the saying has arisen, for we may read that from the low spur of the Pentland Hills, just above Colinton some seven miles from the city, the landscape is exactly similar to that in the vicinity of Athens, as seen from the base of Mount Anchemus.

sloping sides. This, which was once partly filled by a lake—the St. Mary's Loch of history—is now laid out in public gardens, and the green grass rolls in a valley between the buildings of the old and the new standing above on either side. These habitable quarters are connected by viaducts and by a sort of embankment called The Mound, which was formed of the earth dug from the foundations of the new town. The hill, upon the crest of which the old town is built, rises in a sloping ridge, which culminates in the famous Castle Rock, whose rugged sides fall abruptly away in precipitous lines, upon its three other sides, two of which formerly sprang from the waters of the loch. This old part of the town consists of a clustering mass of tall gabled dwelling houses of rough grey stone apportioned in flats, and tenanted by the poorer classes of the people. The long declivity of the High Street and the Cannon Gate shows a crowded vista of these towering cold grey walls and chimneys and gables, where the washing of each family hangs from a wooden gear thrust from every window, and flutters of various dingy colours, in the strong breeze which seems ever to attend the dwellers in the high quarters of the city. Right and

the buildings that stand piled above you not three hundred yards away. This Renaissance Architecture is of the best that is in the British Isles, and there is more of it that touches upon excellence than exists in any other of our towns or cities. It may be mentioned that this New Edinburgh was built during the latter years of last century in accordance with the scheme planned by James Craig in 1767, though the designs of much of the Architecture owe to other architects.

From what has been said of these two traditional styles of Architecture in Edinburgh, and the emphatic contradistinction in which the physical conditions of the site of the city has caused them to be placed, it will be perceived that the native of Edinburgh, and, indeed, every good Scot, who would follow the practice of Architecture in his own country, will incline to favour either the mediæval or the Renaissance styles in his work; and although there are men who make, if it may be so said, a speciality of both these manners—as, indeed, may be instanced of Dr. Rowan Anderson himself—the general inclination is for the architect to be associated with one style or another; and it will only need a glance at the illustrations which accompany this

article to determine in which category we shall place the inclinations and proclivities of Messrs. Sydney Mitchell and Wilson. And the Scots, it is to be noted, are much less cosmopolitan in their architectural tastes than are the architects of England. Their patriotism, and a certain exclusiveness of attitude, are well known; and they are content for the most part to avail solely of their own traditions, and to let their Architecture eulogise and commemorate Scottish traditions and conventions, rather than adopt those of alien races. Much may be said in criticism of this conservative attitude towards Architecture; but when the indigenous architectural style of a country is at once so flexible and suggestive as is this castellated domestic style of Scotland, and lends itself at once to dignity and breadth of treatment, and to the needs of the picturesque, while retaining always that rugged archaic impress which links it indelibly to the

"Land of brown heath and shaggy wood,
Land of the mountain and the flood;
The land of its origin; we may excuse and even
admire the prejudice which has fostered and
cherished it.

Those who would study the traditional examples of this noble Architecture, usually known as "Scotch Baronial," will find it drawn in the ample pages of Billing's "Baronial and Ecclesiastical Antiquities," and also in a volume, entitled: "Castellated Domestic Architecture in Scotland." In these pages will be found several instances of the application of this manner to the needs of modern requirements.

The joint architects of these works are both Edinburgh men, and owe their professional training to the opportunities afforded by that city. Mr. Mitchell, who though the senior

member of the firm, is junior to his partner in point of years, graduated, after a private education, at the University of his native town, and thence passed into the office of Dr. Rowan Anderson, to whom he was articled. Here he met Mr. Wilson, his present partner, who was at that time assisting Dr. Anderson, and after spending five years in the routine of the Edinburgh architect's office, he travelled in Europe, occupying himself with a study of the Architecture of France, Germany, Belgium, and Holland before he returned to Scotland to practice upon his own account. Mr. Wilson, who was a pupil of David Bryce, the famous country town architect, who died some ten years ago, also completed his professional training in the city in which he now practices. His architectural studies took him to France and Italy, and before he joined in partnership with Mr. Mitchell he had held the post of chief assistant in Dr. Anderson's large office.

It will be noticed, as has already been said, that our architects' predilections tend in the direction of the field of Mediæval and Gothic Architecture. One of the largest buildings shown illustrated, "Duntreath Castle," lies in a beautiful situation near to Loch Lomond, and overlooking the Blane Valley. It was built for Sir Archibald Edmonstone, and is constructed of a light grey sandstone, and roofed with green slates. The ornamental ridge stones, or finials, set at intervals to break the roof line, are a characteristic feature of this style. The sketch by Mr. Baldwin, of the Edinburgh Town Cross shows a conjectural restoration of an interesting feature. These crosses are common throughout Scotland, and were designed to afford a platform, or rostrum, from which the various Acts of Parliament might be proclaimed. This custom of proclamation still

exists, and is duly observed in Edinburgh at this day. The original cross was pulled down in the last century to relieve the pressure of traffic, the shaft alone being set up to mark the spot, and it is due to Mr. Gladstone that the cross now stands restored. He was staying with Lord Rosebery when he visited the old town, and, noticing the condition of the cross, obtained leave to commission the architects to rebuild it.

"Sanchieburn" overlooks the field of Bannockburn. This finely drawn perspective by Mr. W. E. English loses much of the impressiveness of the design by failing to show the jointing of the stonework. The character of these buildings, with their many quoins, saddle-backs, and brackets, calls for a great deal of skill in the arrangement of the stone joints, and a great deal of the satisfaction which the beholder derives is due to the unconscious recognition of the constructional qualities of the various parts. The best examples of this style do not contain great stones, but rather follow the true Gothic principle of enhancing the scale of the mass by keeping the stones small. To an eye which is all too unfamiliar with this Scottish Baronial tradition, it would seem as though the balustrade upon the tower were an anomaly, and somewhat of an indiscretion of judgment; and the same incongruous note is struck again in the steps to the main entrance. The architects, however, were a good deal hampered by vexatious restrictions in executing their design, and perhaps it is to these difficulties that the points in question may be attributed.

The picturesque little house at "Bonaly," near Edinburgh, at the foot of the Pentlands by Colinton, owes only the wing to the right hand of the drawing to our architects. This house may serve to introduce a curious feature of the style which governs most of the designs. The reception rooms are usually upon the first floor, and the staircase if it does not ascend to that level upon the outside of the house, does so in a stair that opens direct upon the hall door and conducts the visitor up a tunnel to the house proper. This stair is often merely the entry to the house; it has no other purpose.

In mediæval times the retainers, and attendants, and cattle lived below, and their lords above, and now the arrangement is in general use, because it raises the habitable house above the damp cold mists and snow drifts of the climate. Of the churches illustrated in these pages, it should be pointed out that they follow the Scottish traditions. Fergusson says upon this subject of the Scottish Ecclesiastical Architecture: "Though so near a neighbour" (to England), "the Scots never borrowed intentionally, but, owing to the Celtic element, all their affinities and predilections were for continental nations, especially France. Though not entirely French, the spirit is continental." The chief characteristic of the Scottish churches rests in their towers. These have no buttresses, but a plain square stalk showing unbroken lines, and with the enrichment concentrated in the top, thus following the Italian rather than the Gothic model, and fulfilling Mr. Ruskin's requirements of what a tower should be. Another characteristic feature is the corbelled battlement; and, yet another, a wooden slated spire of a stunted proportion, which has many quaint forms, and owes to the influence of the Dutch, who have had much to say in matters of Architecture and furniture in Scotland.

A GREAT fire broke out on Monday week in the Millwall Docks, which resulted in the total destruction of a large flour mill and two warehouses. The property attacked consisted of a series of low-pitched buildings of varying height, which covered an area of close upon an acre of ground. Messrs. McDougall's flour mills and general stores were surrounded on almost every side with stacks of timber and other inflammable material. This accounted for the remarkable rapidity with which the flames spread to every corner of the premises. The damage has been estimated at nearly £100,000.

Improvements at the Guildhall.

THE Guildhall Library has just undergone a thorough and complete renovation. It is an astonishing fact that there have been no substantial repairs to the building since it was opened in 1872, while upwards of thirteen years have passed since it received even the ordinary "spring cleaning." The exterior of the building has undergone thorough repair, and not before it was badly needed. The stonework, which was in sad condition in some places, has been made good, and the roof has also been attended to. The inside of the building has been thoroughly cleansed from floor to roof. Advantage has also been taken of the closing of the library to carry out several slight but much-needed

STRUCTURAL ALTERATIONS,

and not the least of these is the provision of a better system of ventilation. Hitherto the ordinary "swivel" type of ventilation has been used in the clerestory windows in the large reading room, but for years past the result has simply been the admission of large quantities of dust, to the inconvenience of the reader and the annoyance of the staff. Now, however, the new "drop" window system has been introduced. Air is freely admitted at the top, but the entry of dust, except in infinitesimal quantities, is prevented; while the rain, which was a frequent obtruder in the days of the "swivel" ventilator, is now no longer able to find an entry. Another improvement consists of the removal of the unwieldy desk that stood in the middle of the room. This has been divided, and a portion placed on the left-hand side just inside the entrance barrier, where it will be available for the reception of all the new books, cataloguing, and other "working" purposes. This desk will also contain the card catalogue, for which four new cabinets are to be supplied.

THE DECORATIVE PANELS

of the desk have been utilized to make a second enclosure for the use of the senior assistant. Another portion of the desk has found a home in the committee room. The large glass skylights that were placed in the floor of the reading room for the purpose of lighting the museum underneath, and which were rather a disfigurement, in addition to being of no particular use, have been removed, and the space boarded over, so that the floor has now one uniform appearance. The newspaper room has been painted and distempered, and the whole place properly cleaned. They have been arranged in such a way as to allow of the assistant having a thorough command of the room, and have been augmented by several newspaper standing desks. It is interesting to note *en passant* that the old reading-tables which have been removed were originally taken from the old library in 1869. It is hoped that the City Lands Committee will soon be able to draw up a scheme for the provision of a special room for newspapers and commercial and trade periodicals, and this will probably be included in the new plans that are understood to be in preparation in connection with an extension of the library. The lighting arrangements have also been rearranged, and the electric lights in the library and museum have been lowered so as to give more light in both places.

THE foundation stone of St. Stephen's Church, Portsmouth, was laid last week.

PLANS for the erection of a new isolation hospital at Scarborough, at a cost of £15,000, have been passed by the local authority. Thirty-two beds will be provided, sixteen in the scarlet fever block, ten in the typhoid block, two for measles and diphtheria, and two for observation.

THE 1st of October will see the commencement of the demolition of old buildings between New Street and Union Street, Birmingham, preparatory to the construction of the new arcades. The building contract has been let to Mr. E. J. Charles, of Moseley. A feature in the buildings to be erected will be their flat roofs, which will be covered with vulcanite.

Another Old House Vanished.

AT this moment, writes Mr. Percy Fitzgerald in the Westminster Gazette, an interesting old London relic, nigh two hundred years old, is "passing away"—as we would say it of a living person—being dissolved into dust and broken bricks, under the hands of the "housebreakers." Many passing through Whitehall, whence King James has been promoted—will have noted the forlorn-looking and disused late United Service Museum, which seemed to invite speedy extinction. This quaint little building—who would guess it?—was once associated with Dr. Swift, and ridiculed by him in his verses. It was built as a residence for himself by the architect of Blenheim Palace and of a portion at least of Greenwich Hospital. Here the jovial Sir John Vanbrugh, architect, soldier, and successful dramatist, saw plenty of company and many a merry night. The stones that are now being carted away were the actual stones of the old Whitehall Palace, which Sir John, having to do with the public works, obtained leave or gave himself leave, to use. It always seemed a compact and rather well-designed little mansion, laid out with much variety, considering its small size. In the last century the eminent architect Robert Adam added on in front two pavilions with but awkward effect. Indeed, in this instance it was he, and not Sir John, who laid "a heavy load" on earth. Swift likened it to the pattern of a

card-house built by some little miss, two stories high:—

Still at Whitehall it stands in view,
Just in the place where first it grew.
... At length they in the rubbish spy
A thing resembling a goose pie.

Mr. Knight died there in 1726. Thus the little building had interesting memories and associations which will be missed by those who care for such things. But I venture to say that not one in a hundred, or, it may be, thousand, knew anything of the history of this old building. At this moment there seems to be a sort of race as to who shall destroy these old buildings. They are coming down "right and left" with an alarming rapidity. I expect every day to come upon a hoarding set up round Dr. Johnson's house in Gough Square—one of the few sacred things left to us. But 'twill go, and that very soon.

A new hotel is about to be built on Coverack Headland, Falmouth Bay, from plans by Mr Sampson Hill, of Redruth. The estimated outlay is £7000.

THE "bicycle stable" which the authorities of the British Museum had in progress for the convenience chiefly of cycling ticket holders of the reading room, is now completed and in use. Situated under the massive granite plinth of the east block of buildings, it is approached down an incline, and is furnished with between fifty and sixty automatic "penny-in-the-slot" clips.

COMMERCIAL BANK, GLASGOW. MESSRS. MITCHELL AND WILSON, ARCHITECTS.

DEVELOPING A BUILDING ESTATE.

THE birth of a watering place is generally an interesting event. Many of the popular seaside resorts are now becoming too much like grimy old London in the matter of bricks and mortar, to suit the taste of those of a Ruskin turn of mind. New watering places are therefore in demand, and popularity is quickly gained by any and every resort where lovers of both ocean and landscape can find a quiet home, or spend their summer holidays "far from the madding crowd." Telscombe Cliffs, on the Sussex coast, is not yet a seaside resort catering for visitors, but it hopes to be in the near future. At present Nature is reigning there supreme, and the eye gazes upon no habitation of man. Roads, however, are being made for the formation of a coming town, and their names are boldly inscribed at the corners of the "thoroughfares," reminding one somewhat of "the thriving City of Eden," to which Martin Chuzzlewit journeyed. The estate, undoubtedly, has before it a bright future, mainly on account of its charming situation, its high elevation, and its proximity to the metropolis. It is located between Newhaven and Brighton, being some three miles from the former town, and six miles from the latter, or 56 miles from London.

THE PICTURESQUE VILLAGE OF ROTTINGDEAN, one of the popular drives for Brighton visitors, is just two miles distant along the romantic coast; and Telscombe village is about one mile away inland, nestling in downs. The first step towards the development of Telscombe Cliffs was taken a few days ago, when Messrs. Harman Brothers, of 75, Aldermanbury, conveyed down from London by a special train a company of some 250 builders and investors on the occasion of offering for competition 150 freehold sites forming a portion of the estate. At the sale, the auctioneer, in introducing the property, said that there was undoubtedly room for one more seaside resort near London, and a more delightful and healthy spot than that forming the Telscombe Cliffs Estate could not be selected anywhere upon the south coast. Almost all the other watering places there, he said, stood on low ground, but the land upon the estate he was about to offer stood nearly 100ft. above the level of the sea—a fact that ought to attract multitudes of jaded Londoners. In reference to railway communication, the auctioneer expressed his belief that in the near future a station would be

ERECTED ON THE ESTATE,

as it was within two miles of the line from Newhaven to Brighton, so that a branch could be constructed without any considerable outlay. Dealing with the water question, he said

that there would be no trouble in that direction, as an artesian well had been bored on the estate, and a good supply of water was obtainable. The auctioneer, in conclusion, promised the future inhabitants of Telscombe Cliffs entire exemption from rheumatism, in consequence of there being a subsoil of chalk upon the estate. With these cheerful prospects before them, it is no wonder that bidders entered into brisk competition to secure the sites offered, all of which were quickly disposed of at very satisfactory prices. Several of the principal lots were secured by buyers from Brighton and Newhaven, showing the high appreciation in which the estate is held locally. Shop lots in the Brighton Road, having a frontage of 57ft., and a depth of 200, realised £48 to £55 each, whilst corner lots obtained the good figures of from £75 to £80. Sites in the Esplanade (which directly faces the sea, and therefore forms the choicest portion of the estate) went for £57 10s to £67 10s. each, and

CORNER PLOTS

fetched no less than £87 10s. to £100—a good price, taking into consideration the fact that the frontages to these lots are only 30ft., with a depth of from 117ft. to 140ft. In the less prominent roads, named Eastern Avenue, Central Avenue, and Western Avenue, the prices ruled from £29 to £40 each, many of these lots being bought in blocks of six. The chief item of the sale, however, consisted of the hotel site, with a frontage of 125ft. to the main Brighton Road, and a similar return frontage to Eastern Avenue. This lot was offered on a lease of 99 years, at a nominal ground rent of £1 per annum, with the option of redeeming the ground rent on payment of £25 after the premises have been erected. There were considerable competition to secure the site, as it is the only one upon which a licensed property will be allowed. It changed hands at the excellent price of £450, a local property owner being the purchaser. The total of the day's sale amounted to close upon £7000. Other portions of the estate will shortly be offered.

STREET MUD.

THE Western Mail (Cardiff) recently set on foot some experiments with street mud. At Cardiff, it is stated, about 30,000 tons of mud are collected off the streets every year. For the experiments, cubes of various specimens of macadam in common use were submitted to tests by percussive attrition and absorption, as well as ordinary thrusting. The results of these experiments, which were carried out by Mr. Arch. C. Elliott, D.Sc., M.Inst.C.E., Professor of Engineering at the Cardiff University College, Mr. W. S. Boulton, F.G.S., A.R.C.S., furnishing the mineralogical description of each cube, have just been published in a report

signed by Professor Elliott. The specimens included three samples of basalt submitted by the London Basalt Stone Company Limited, and cubes of Penlee and Clee-hill Dhu basalt; Cornish, Clee-hill, Wicklow, Guernsey, and Aberdeen granite; Mumbles, Sweldon, and Cwmynofydd limestone; sandstone, and neat Portland cement. In the thrusting tests the London Basalt Company's three sets of specimens stood a respective average maximum stress per square inch of 9.35, 12.02, and 12.45 tons; the other basalts bore 5.54 and 9.45 tons respectively; the Clee-hill, Wicklow, and Guernsey granites went up to 5.49, 6.41, and 7.99 tons; the Mumbles limestone to 5.96; and the other two limestones to 3.99 and 3.09 tons. The real mud test, however, was that by percussive attrition, the specimens being separately subjected to rapid motion against the ribbed sides of an iron cylinder in a manner calculated to reproduce the action resulting from vehicular and other traffic. The reports on the tests were as follows:—

PERCUSSIVE-ATTRITION TESTS.

Date of Testing, August 18th, 1898.

Material.	Dust or dry mud produced in four hours' test per cent.	Average compressive strength, tons per sq. inch.
Basalt C	3.2	12.45
Basalt A	5.9	9.35
Basalt B	6.5	12.02
Clee-hill granite	7.0	5.9
Penlee stone	7.2	5.54
Clee-hill Dhu stone	7.9	9.45
Wicklow granite	8.0	6.41
Guernsey granite	9.3	7.99
Aberdeen granite	15.7	—
Red brick (hard)	16.9	—
Black limestone, Mumbles	20.0	5.96
Cornish granite	22.1	—
Road metal from Cardiff Gaol Store (Castell Coch)	22.5	—
* Road metal from Cardiff Gaol Store (Ely)	26.4	—
Sweldon stone	30.2	3.99
Cwmynofydd, Tongwynlais	37.7	3.09
Hard sandstone	89.4	—
Neat Portland cement	89.5	—

* Laid down in Plasterton district.

ARCH. C. ELLIOTT, D.Sc., M.Inst.C.E.

ABSORPTION TESTS.

Material.	Hours soaked.	Per cent. absorbed.
Basalt A, B and C	72	More tr. cc.
Penlee stone	78	"
Clee-hill granite	72	"
Clee-hill Dhu stone	72	"
Wicklow granite	78	"
Guernsey granite	72	"
Black limestone, Mumbles	29	"
Sweldon	54	8.7

THRUSTING TESTS.

The following abstract of results shown in the thrusting tests gives the specimens in order from the highest to the lowest:—

Stone.	Max. load. Av. stress, tons, per sq. inch.
Basalt C (submitted by London Basalt Co.)	12.45
Basalt B " " " "	12.02
Basalt A " " " "	9.35
Clee-hill Dhu " " " "	9.35
Guernsey granite " " " "	7.99
Wicklow granite " " " "	6.41
Mumbles limestone " " " "	5.96
Penlee " " " "	5.54
Clee-hill granite " " " "	5.49
Sweldon limestone " " " "	3.99
Cwmynofydd limestone " " " "	3.09

Hitherto very little information has been available as to the qualities of macadam in common use, and it is claimed that these are the first experiments made in this country by means of experimental attrition, and that the machine, specially constructed at the Cardiff University College for these tests, is the first of its kind in the United Kingdom.

"RONALD," NEAR EDINBURGH. MESSRS. MITCHELL AND WILSON, ARCHITECTS FOR ADDITIONS.

CONTRACT CONDITIONS.

AS an instance of the terms that are being imposed on contractors for municipal work, a firm of contractors send a verbatim copy of the general conditions attaching to a certain undertaking for one of the largest Corporations in the country. The firm writes: "The stipulations, or the tenour of them—for we cannot understand the phraseology—are such as no firm of free individuals should agree to. The ratepayers will be without our competition, whatever that may be worth."

"General Conditions.—The contractor shall to the (*sic*) at all times during the continuance of this contract abide by, perform, observe, fulfil, and keep all and singular the stipulations following—that is to say:—

"Wages of Workmen.—The contractor shall

the town clerk, which consent may either be withheld or given, subject to the terms such as the Corporation may determine, and particularly that the person to whom such contract may, or any part of it, share, or interest therein may be transferred, assigned, or underlet, shall abide by, perform, observe, fulfil, and keep the stipulations on the part of the contractor herein contained.

"Book-keeping.—The contractor shall, to the satisfaction of the Council, provide and keep proper books, in which shall be entered from time to time the names of, the wages paid to, and the hours of labour observed by all workmen employed by him, whether in or about the execution of this contract or otherwise, and shall from time to time, when required by notice under the hand of the town clerk, produce the same, or any of them, to him or to the deputy town clerk, who shall be at liberty to inspect and take copies or extracts therefrom.

THE ABBEY MANSIONS
COLLAPSE.

AT Westminster, last Thursday, under the Dangerous Structure Clauses of the London Building Act of 1894 and the Amendment Act of 1898, a summons was heard before Mr. Marsham, addressed to the owners of the building known as Abbey Mansions (North Block), requiring them to take down the cracked and defective portions of the stonework of the angle turret at the corner of Victoria Street and Orchard Street. Mr. F. F. Daldy, instructed by Mr. Seager Berry, appeared for the London County Council, and Mr. Pollard defended.—Mr. Daldy said the building was now in a very dangerous state, and something must be done, though the

Free Church Fort William N.E. View
Sydney Mitchell & Wilson Architects

pay every workman employed by him, whether in or about the execution of this contract, or otherwise, wages and wages for overtime respectively, and at the rate not less than that recognised in the district where the work or any part of it is being done as the standard rate of wages in such workmen's trade.

"Hours of Labour.—The contractor shall observe the, and cause to be observed by each workman, hours of labour not greater than the hours of labour (other than that union men only be employed) usually observed in the trade of such workmen in such district.

"Lock-out.—The foregoing conditions shall not apply to any trade, or trades, during the existence of a general lock-out in such trade or trades. The Corporation shall be sole judges as to whether such a lock-out exists.

"Underletting of Contract.—The contractor shall not transfer, assign, or underlet, directly or indirectly, this contract, or any part of it, share, or interest therein without the written consent of the Corporation under the hand of

"Breach of Contract.—In case of any breach of the contractor, or by any person to whom this contract, or any part of it, may be transferred, assigned, or underlet, of any one or more of the stipulations in this clause contained, it shall be lawful for the Council to determine this contract in the same manner and to the same extent as they have power so to do under the clause 5 in the events therein specified, and if the contract shall be determined under the present power, then all the provisions of that clause shall apply as if the contract had been determined under that clause."

"Tenders to be suitably endorsed and addressed to the Chairman of the Gas Committee, Municipal Buildings."

THE laying of the foundation stone of the new isolation hospital for Southampton at Mousehole Lane, Shirley, took place last Wednesday.

County Council had been placed in a great difficulty by the previous decision of the Court that the building was vested in, and in the occupation of, the Crown. The County Council had been in communication with the Government, and Sir John Taylor, surveyor to the Office of Works, would tell the Court

THE PRESENT POSITION OF AFFAIRS.

Mr. Marsham: Supposing it is Crown property or vested in the Crown, do you say that a magistrate has no power?—Mr. Daldy: No, sir. It is exempt.—Mr. Marsham thought it a pity that what was necessary for the public safety could not be done at once, and the question of liability decided afterwards.—Mr. Daldy said that there had been a promise to strengthen the defective part of the building with steel bands, but only one band had been put up.—Mr. Pollard said that five steel bands would be in position in a few days. Mr. Pawley, who was the owner, while not admitting any obligation, was doing everything he could.—Mr.

Drury, district surveyor, called by the prosecution to testify to the present condition of the building, said that the cracks in the brickwork were widening. He thought that the stonework of the turret was moving, and all the cracks developing. The indications showed the possibility of a very serious accident. On September 14th there was a piece of stone nearly falling from the front of the building.—Mr. Daldy: In your judgment it is necessary for the safety of the public that this building should be shored up at once?—Witness: I certainly think so. The cracks have extended considerably since the 19th. I think the second floor of the building is in a very critical condition.—Mr. Daldy: Assuming that five steel bands are put up, and taking into account what you have seen, would you be satisfied with the bands?—Witness: After my inspection this morning I am of opinion that the steel bands would not suffice.—Cross-examined, Mr. Drury said that during the last few days he had detected a number of

FRESH CRACKS IN THE STONEWORK.

Sir John Taylor, of Her Majesty's Office of Works, said he had nothing whatever to do with the construction of the building, his advice being given only on sketch plans as to accommodation which would be sufficient for certain public departments. On August 3rd last witness made an official inspection of the building, and seeing defects and fractures in the walls, he refused to give a certificate for the Government to take it over. He thought it unsafe for habitation, as unquestionably there was a settlement.—Mr. Pollard denied this. He said that there was no trace of subsidence, and the alarming reports in the Press which had been circulated to that effect were entirely devoid of truth.—Sir John Taylor said the Government had repudiated the agreement to take over the building.—Mr. Pollard said that there was an action pending for specific performance. His contention was that precisely the same circumstances existed as when the court before decided that there was no power to make an order.—Mr. Marsham suggested that the district surveyor and the defendants' surveyor should confer with an arbitrator and try to arrive at an understanding.—After a great deal of discussion the case was adjourned.

VANISHING LONDON.

THE coming demolition of the old Prince of Wales's Theatre, off Tottenham Court Road (its proper address is No. 21, Tottenham Street), may be mourned by those who remember the days when it was one of the most fashionable and crowded playhouses in London, but the majority of people who only know it in its present pitiful condition will hear of its disappearance without a pang of regret. Even in its palmy days the theatre could never lay claim to much external beauty, and nowadays, with its walls a patchwork of ugly posters, and its dirty and squalid surroundings, it is really a most deplorable-looking object. As a playhouse it was closed a decade or so ago. Originally it was the concert room of Signor F. Pasquali; then the directors of the Concerts of Ancient Music bought and enlarged it, and built a magnificent royal box for George III. and Queen Charlotte. Next it became the home of "The Picnics," a body of amateur players, "whose celebrity," writes Mr. Timbs, "rendered them objects of alarm to the professional actors of the day, and exposed them to the attacks of the caricaturist, Gilray." About 1807 it was transformed into a sort of circus, but it could never be compared in this line with Ashley's. Converted into a theatre it passed through many hands, and under almost as many titles. It was a dingy, dirty enough theatre in those days, so much so, indeed, that it was popularly known as "the dusthole." When, however, the house was taken over by Miss Marie Wilton, who improved the construction of the building and gave it its name as the Prince of Wales's, the tide in its fortunes took a decided turn for the better, and the days of its prosperity began.

LEEDS FEVER HOSPITAL.

LEEDS is soon to be in possession of one of the most complete and best equipped fever hospitals in the kingdom. The Manston Hospital is nearly completed. The building is arranged on the pavilion and isolation system, with the application of all the most approved methods in use. When the committee took the work in hand—which has unfortunately been delayed owing to the builders' strike that extended over six months—the estate was practically a green field, with the exception of the fine hall that still stands in the grounds, and which has now been turned into the headquarters of a portion of the hospital staff, with residence for the medical superintendent. Around the mansion, in isolated positions, stand the

LARGE NUMBER OF PAVILIONS

that have been erected. Of these pavilions—which are built of brick, with stone dressings, and concrete floors finished with oak—three are at present to be in readiness for the reception of patients. Each of these pavilions is entered by a suitably designed doorway in the centre, which breaks the building into two wards, and provides waiting-rooms and additional bedrooms. Every pavilion is lighted and ventilated on the most desirable principles. In addition to these three pavilions, which are to be at once in use, there is a fourth, built on precisely the same plan, and also intended for the treatment of patients, but which is for the present to be used as an administrative section. This arrangement, however, is only temporary, for when the number of patients makes it necessary this administrative block can be readily turned into a patient's pavilion, and other arrangements made for administration. These pavilions are roughly about 180ft. long and 30ft. wide. Besides these four pavilions directly intended for the treatment of inmates, there is a fifth of a similar character, which is known as a new isolation pavilion.

ANOTHER IMPORTANT NEW BUILDING

in the hospital is that known as the disinfecting block. This measures about 150ft. square. In its centre are three Lancashire boilers, which, besides providing heat for disinfecting purposes, are to heat the water necessary for wash-houses and laundries, as well as the requisite heat for the cooking for the whole of the building. It is interesting to note here that communication is carried on between one point of the hospital to another under glass-covered awnings supported by iron pillars. An advantage of this arrangement is that the food will be conveniently conveyed from the kitchen to the pavilions scattered over the estate. In another portion of the grounds are two new smallpox pavilions—one for the treatment of patients, and the other for administrative purposes. These supplement the old smallpox and administrative pavilions. Amongst other buildings and improvements on the estate are a porter's lodge and a caretaker's house. There are also six other pavilions which have been adapted for the isolation of families in whose midst disease has occurred. There are likewise two mortuaries. It is needless to say that great care has been taken in the sanitary arrangements. The hospitals may be justly said to be second to none of its kind in the country. The work has been superintended by Mr. E. B. Martin, under the city engineer. The principal contractors have been Messrs. William Irwin and Co., Leeds.

THE Lock Chapel in the Harrow Road has been redecorated and greatly improved.

THE sum of £1500 has just been expended upon the addition of a new wing to the Institute at Lytham. The new wing provides larger reading room, library, additional rooms for technical classes, and a gymnasium.

THE work of laying the electric light cable along the broad walk from the Marble Arch to Achilles Statue in Hyde Park has commenced. The lamps are already erected, and it is expected that in a few days the installation will be complete.

ECCLESIASTICAL ART.

AN Ecclesiastical and Educational Art Exhibition was opened on Monday at Bradford. The Lord Bishop of Richmond heads the list of exhibitors with the church plate from Stanhope; the Rev. E. W. Bereton contributes a very beautiful chalice and paten, set with precious stones, and from the Rev. R. G. Irving comes a silver chalice, 187 years old. The vicar and churchwardens have lent the Bierley communion plate.

AN OBJECT OF GREAT INTEREST

is a cast of the Moabite Stone, lent by Mr. David Parkes, of Sheffield. This contains an inscription of Mesh'a, son of Kemoshgad, King of Moab about B.C. 900, recording his victories over the Israelites, found at Dibon, in the land of Moab. The only other cast similar to this is in the British Museum. Mr. Farris has some interesting loans connected with St. Ethelburga Parish, Bishopsgate Street, London, including a silver flagon, of date 1694; a paten, a silver chalice, 1560; and the beadle's staff, with date 1787. Mr. William Scruton sends a very interesting collection of old views of Bradford and Yorkshire generally. A very noteworthy exhibit is No. 149, a golden chalice. This is to be presented to New York Cathedral, and is a magnificent piece of

PURELY MODERN WORK.

The design is of the fourteenth century period, and it has taken about four years to carry out. It does greater credit to the designer, Mr. W. Keith. The Rector of Whitby sends two engravings of Whitby Abbey as it was 100 years ago and as it is now; also some engravings of his unique church. Mr. J. Eyre Poppleton exhibits a number of casts from pre-reformation bells in Yorkshire church towers. Mr. Samuel Margerison, of Calverley Lodge, near Leeds, sends about 150 photographs, each one illustrating something of "what we see in an old parish church." For instance, No. 348 is a photograph of a bell gable from Howell, Lincolnshire; 389, a doorway from Brixworth, Northants; 412, a poor's box from Wellingore, Lincolnshire; 416, a font from Helpringham, Lincolnshire; 421, a font and cover from Calverley; 429, a pulpit from Hannington, Northants; 436, a lectern from Blythborough, Suffolk; and so on, until each part of an old church is illustrated by photographs of carefully selected specimens. The Ven. Archdeacon Kilner and the churchwardens of Bingley, Yorkshire, lend the Communion plate, and the Mayor and Corporation of Bradford have also placed on view the Corporation plate. A very handsome jewelled chalice of splendid workmanship is lent by the Rev. T. A. Curties, and a silver-gilt chalice and paten are shown by the Rector of Bacton, Herefordshire. This is without doubt one of the oldest pieces of

ENGLISH HALL-MARKED PLATE

known; a white altar cloth of historical interest is lent from the Church of St. Faith, Bacton. Admirers of the Brontë family will revel in the exhibits of Mr. J. Horsfall Turner, the greater part of whose large collection consists of Brontë relics. From the Rev. Hugh Williams comes a communion cup, temp. Charles II. and a curious old poor box from the Rev. W. E. Hancock, Knaresborough. The Rev. G. E. Redhead, of St. Mary Magdalene, White Abbey, and Churchwardens, show some very handsome embroidery; but it is to the Vicar of Bradford that the Exhibition is indebted for one of the finest works of Art in the collection, namely, the celebrated Flaxman tablet. This is universally recognised as one of the great sculptor's masterpieces, and as the church is now undergoing restoration, and the tablet has been temporarily removed, it has appropriately found a home during the Congress week in the Ecclesiastical Art Exhibition.

THE new Grammar School and William B. Barbour Academy at Paisley was opened a day or two ago. The new Grammar School and Academy has been erected, including site, at a cost of over £30,000.

Architectural and Engineering Jottings in the Midlands.

By W. N. TWELVETREES.

THE Institution of Mechanical Engineers, whose Summer Session has recently terminated at Derby, does not consist entirely of those whose interests are confined solely to mechanical appliances. Amongst its members are many eminent men who have been concerned in structural and other work more or less intimately associated with the duties of the architect. In view of the fact that iron and steel take so important a place in the construction and equipment of modern buildings, it is not surprising to find that amongst the visits arranged during the period mentioned there were many having for their object the inspection of public buildings and of public works designed to minister to the domestic necessities of mankind.

Birmingham, the capital of the Midlands, is purposely excluded from these notes, although the writer had occasion to visit that city from Derby on the day before the commencement of the session. The return journey was undertaken by the aid of a bicycle, a pleasant, if somewhat undignified, means of locomotion.

Leaving the noisy and not exceptionally agreeable outlying streets of Birmingham, the ancient city and county of Lichfield was reached, and in the cool eventide its deserted streets, and the quiet of its cathedral close, presented a striking contrast to the turmoil of the great city left behind. Most of our readers doubtless know the beautiful cathedral, with its richly ornamented front, and have admired its three spires surmounting the cool and shaded depths of Pool Well. These features of Lichfield are illustrated on a pictorial map in the possession of the writer, and described in the following terms, "Letch-tulce, their spiers from pool weil." Both the map and the language it is perhaps needless to explain were "made in Germany." Owing to a temporary mishap in connection with the tyre of his machine the writer was afforded an unhoped for opportunity of walking into and through the principal streets of Burton in search of an hotel. The first impression given to the traveller by Burton is that its distinctive characteristics consist mainly of breweries and of level crossings. It is not remarkable for good hotel accommodation, and in this respect there is certainly virgin soil upon which a novel architectural feature in the town might well be created.

To the archaeologist the glory of Burton lies in the past, notwithstanding the fact that a modern muse has applied a similar qualification to one of the staple products of the place, the consumption of which is popularly believed to largely occupy the leisure of some of the community.

Standing on the grand Roman highway—the Icknield Road—Burton was once famed for its bridge over the Trent. Some antiquarians have, indeed, contended that this structure had withstood the hand of time for upwards of two thousand years, and that the Icknield Road must have passed over it on the way to Derby. The present Trent Bridge, opened in 1864, is 460 yds. long, about 30 ft. wide, with twenty-nine arches, and has proved to be of great convenience to the inhabitants. Burton Abbey, founded in 1002, entirely disappeared in the year 1719, when the present parish church was erected on the same site. The only vestige remaining of the original structure is the west gate of a stone wall once enclosing land surrounding the abbey. Perhaps the most pleasant recollection to be taken away from Burton is that of the interesting church, which, charmingly situated on the banks of the Trent, also stands on the highest land in the town, thus furnishing another instance not only of the good taste but of the practical common sense possessed by ecclesiastical architects of the past.

Derby is a place of some antiquity, having been created a Royal borough in 1305 by Edward I. Situated in the immediate vicinity

of iron and coal there are contained within its borders some important industrial undertakings, besides the extensive works of the Midland Railway Company.

Mildly and even increasingly, prosperous Derby has not followed the example of some manufacturing towns, which have succeeded in driving all evidences of Nature from their midst, and the adjoining districts still present a pleasing illustration of the lion lying down with the lamb, in external relative positions—of agriculture and manufacture living together in harmony and peace.

The attention of engineers is naturally rivetted upon the locomotive works of the Midland Railway Company, which cover an area of about eighty acres in extent. In addition to the building of locomotives, however, there are several things of general interest to be seen. The Company manufacture their own gas in works purchased from the Derby Corporation in 1875, and last year the supply to stations, &c., in the district was upwards of 130 million cubic feet. Gas is here also made for the purpose of carriage lighting from shale oil by a very simple and interesting process, and one which might be more largely adopted in some country districts, especially as apparatus to suit very modified requirements is readily obtainable. All water used in the works and supplied to locomotives is softened and purified by the Archbutt-Deeley plant, which is here capable of treating 30,000 gallons per hour, but is also made suitably for domestic application in dwellings, hospitals, &c. In the carriage and wagon department, having an area of nearly 100 acres, the workshops are worthy of notice for substantial construction and exceptional size, their lengths being from 200 ft. to 400 ft., and widths varying from 100 ft. to 300 ft. The largest is the carriage painting shop, 400 ft. long by 300 ft. wide. Timber is here used and stored in enormous quantities; the principal timber yard covers an area of 13 acres, and is traversed for the whole length of 1400 ft. by three lines of rails. One side is used for stacking deals and battens, and the other for American and Stettin oak logs. On a portion stands a shed 600 ft. long and 100 ft. wide, for storing and drying oak scantling; this building is provided throughout its entire length with light overhead cranes.

There are several other timber drying sheds, built of timber, with louvered walls to admit of free circulation of air. The sheds are chiefly stocked with planks and scantling which have been cut into standard sizes, and are allowed to season naturally for an average period of two years before use.

In front of the sawmill is a gantry 350 ft. long and of 50 ft. span, with two 5-ton overhead travelling cranes for unloading, stacking, and otherwise dealing with oak logs, which are, as far as possible, cross-cut and ripped up on arrival. The sawmill is 320 ft. long and 250 ft. wide, and contains, in addition to circular and reciprocating saws, 138 machines for mortising, tenoning, boring, planing, grooving, band-sawing, carving, turning, dovetailing, panel-planing, and sandpapering. Carriage building, upholstering, and finishing are done in other shops of similar dimensions to those already mentioned, and all the castings and ironwork are made in the carriage works, which constitute an entirely self-contained department.

The Siddals Road Timber Mills were entirely rebuilt, owing to a disastrous fire, in July, 1897. They probably constitute one of the most complete establishments of the kind in this country, and are equipped with the most modern types of machinery obtainable. An extensive business is done in timber bending, turning, and joinery work, and amongst the clients of the company are H.M. Government, many leading railway companies, contractors, etc. The mill consists of three lofty and substantial bays lighted by electricity, and contains band saws, one of which, having 8 ft. pulleys, is capable of cutting trees 5 ft. in diameter, vertical log frames, horizontal, cross cutting, rack, and a number of circular saws, automatic lathes, and various forms of planing and other machinery.

There are in Derby a number of foundries and engineering works, in several of which

constructional ironwork forms a leading part of the work carried out.

Messrs. Eastwood, Swingler and Co., of Victoria Ironworks, are largely concerned in the construction of roofwork and bridges, both large and small. Their works cover over 27 acres, and find employment for about 1000 men.

Messrs. Andrew Handyside and Co., of Britannia Ironworks, have erected a considerable number of enclosed markets, winter gardens, drill halls; and are makers of fountains, vases, gates, etc. The number of men engaged here is also about 1000.

The Phoenix Foundry Co. were amongst the first to be associated with constructional ironwork, and assisted in the erection of the Columbia Market, London; Shudehill Market, Manchester; and others at Stockport, Halifax, Rotherham, and Derby. Battersea Bridge was also erected by this firm, who at the present time are interested in contracts connected with the Central London Railway.

To all lovers of Art, the examples of china, exhibited at the Royal Crown Derby Porcelain Works, are especially fascinating. They are also dangerously alluring to visitors, whose impulses are not kept under rigid control. Derby ware was first mentioned in 1750, and in the present works, the traditions of the Bow and Chelsea ware are also maintained. All kinds of ornamental and useful articles are made, and the delicacies of their fine pierced and relief work are only equalled by the exquisite character of the decoration afterwards applied. Egg-shell china, almost as thin, but far more transparent than the shell of an egg, is a speciality of this factory. These apparently fragile articles are mostly decorated in schemes of gold and various bronzes.

In Uttoxeter Road is the wall-paper manufactory of Messrs. W. G. Wilkins and Co. Erected in 1890, the premises have just been considerably enlarged, and further extension is likely to be needed in the near future. Sanitary papers are here produced and form a large proportion of the work carried out.

Following tram rails which extend round the interior of the works the large new surface-printing shop is entered, where ten powerful machines are working. The paper from a roll, nearly a mile in length, passes round a large cylinder, and comes into contact with the printing rollers, which each have a different part of the pattern in relief on their surface. As the wet paper comes off the roll it enters a huge drying machine. In "sanitary" printing the colour is forced by tremendous pressure into the paper. The copper printing rollers are made with sunk patterns, and in this process the colours are made to overlap, so that variously blended shades are artistically produced from prismatic colours. After printing, a wonderfully intelligent automatic machine picks wooden rods from a box and hangs the paper on them, next placing the rods upon chains, which travel up and down long tunnels fed with hot air. As the pattern dries, other machines roll the paper up, and deposit the sticks into the box ready once more for use. In the warehouse, rapidly working machines roll up the paper into single pieces or rolls, which are packed in bales ready for the trucks, which come up by the side of the little tramway station.

The streets of Derby are excellently lighted by electricity, supplied from the Corporation electric light station, whence current is also laid on for a number of private consumers for lighting power, cooking and other purposes. Designed by Messrs. Bramwell and Harris, of Westminster, the buildings containing the plant are of a substantial character, and have an effective ornamental frontage.

The public free library, museum and Art gallery is contained in a handsome building in the Flemish-Gothic style, of red brick, with white facings. On the ground floor are three spacious reading rooms (one being for ladies), reference, lending, and children's library, whilst the upper floor is devoted to a natural history museum. The curator's house and porter's lodge are separate erections.

Connected with the same building, but with a frontage on the Strand, is the Corporation Art Gallery, containing a magnificent collection

of Derby china and a collection of paintings. Three exhibitions of paintings are also held here every year.

As an instance of the wise forethought exercised with regard to the education of the rising generation, the Municipal Technical College is worthy of mention. The college is also an excellent combination of artistic and practical Architecture.

Built in the Gothic style from the designs of Messrs. Waller and Son, of Gloucester, the building is of rectangular form, and of its four elevations those on the south and east are plain and built of red brick. The frontages in Degge Street and Green Hill have Riga pitch face wall stones with Hollington stone dressings. Facing Green Hill, the elevation is treated in a very artistic manner, and has a generally pleasing effect. The principal entrance has a porch projecting about 6ft. from the main building, and there are two other entrances—one for Art students and the other for science students.

From the porch, the entrance hall has a good effect with its polished red granite columns, carved capitals, stone arches, and mosaic floors. The chief staircase from the hall to the first floor has York stone steps, wrought-iron ornamental balusters and skirting with a polished oak handrail. Glazed brick dados line the staircases and corridors to a height of 5ft. The corridors leading to the different rooms are lighted from two open courts faced with white-glazed bricks. The floors include a sub-basement, basement, ground, first and second floors.

In the sub-basement is the heating and ventilating apparatus, which is on the plenum system, having a steam heater and an electrically driven fan 7ft. 6in. in diameter. The basement contains engine rooms, plumbing shop, typography room, and a large room for manual instruction.

On the ground floor are a large Art lecture room, the physical laboratory, several class rooms, the committee room, and secretary's offices. A large antique room for Art purposes, a fine lecture theatre for physical and chemical demonstrations, and a mechanical drawing room are on the first floor, whilst the top floor has exceptionally well-fitted chemical laboratories, class rooms, and a spacious room, used for light and shade drawing.

All the rooms in the building are well lighted and lofty, the floors throughout being fireproof on the Dennett and Ingle system of concrete arches.

Advanced Art is taught with considerable success, and the science department includes the subjects of building construction, chemistry, hygiene, &c.

Occupying a site of over thirteen acres on the London Road is the Derbyshire Royal Infirmary, of which the foundation stone was laid by Her Majesty the Queen. The scheme for the complete infirmary includes seventeen distinct blocks, of which thirteen have been erected, the others being deferred for future requirements. Messrs. Young and Hall, of London, were the architects, and in their designs breadth of effect, rather than meaningless adornment, has wisely been attempted. Viewed from the boulevard-like London Road, these buildings, situated well above the road level, present a bold and striking appearance, pleasingly qualified by foliage in the grounds by which they are fronted. In the centre is the administrative block, through which runs the main corridor of the hospital. From it projecting right and left are the ward pavilions of two stories each, the operating rooms, eye wards, and chapel. At the south-west end is placed the out-patient block, with a waiting hall seating 230 persons, consulting rooms, dispensary, &c. The general wards are 127ft. long, 14ft. high, and each contains twenty-four beds. Each patient has 2066ft. of cubic space. The floors are made of terrazzo, and were the first ward floors laid of the material in this country. The chapel, seating 100 persons, was erected in memory of the late Sir William Evans, Bart.

The operating-room is lined with marble slabs up to a height of 7ft., above which the walls and ceilings are finished in Keene's cement. The floor is of terrazzo, and electric

lighting is adopted in the wards, the chapel, and the operating theatres.

Behind the main buildings are an isolation hut, mortuary, joiners' shop, &c. The nurses' home is completely detached from the remainder of the hospital, and affords accommodation for forty-eight nurses, each of whom has a separate bedroom. Steam laundries, disinfecting house, refuse cremator, and a large water tower are situated at the back of the rear administrative block.

Leaving the immediate vicinity of Derby, the extensive works of the Stanton Iron Company are well worthy of a visit. In addition to working iron stone mines yielding annually some 500,000 tons, and collieries from which about 4000 tons of coal are raised daily, the Stanton Iron Company have works covering some 90 acres, and largely devoted to the manufacture of cast-iron pipes and fittings for gas, steam and water. Machinery and appliances of the most improved modern types are used in this department, and pipes varying from 1½in. to 60in. diameter are made in various lengths up to 12ft. All pipes are tested by hydraulic machinery before leaving the works.

Another class of manufactured articles, applied both for artistic and utilitarian purposes, are those produced at Messrs. Minton's china, earthenware and tile works, near Stoke-upon-Trent. These works were founded in 1793, when the goods manufactured were for the most part plain in design, but neat, serviceable and excellently made. In 1821 semi-transparent porcelain was introduced, and soon afterwards the manufacture of china was commenced. In 1842 Parian ware was produced, followed by English majolica, which the firm were the first to make. The latter product is characterised by the opacity of the surface enamel. Cornish clay, blue clay, flint, Cornish stone and bones are the chief materials used. Cornish clay is mostly supplied from the neighbourhood of St. Austell, and is a compound of silica and alumina in about the proportions of 60 and 40 respectively. Blue clay comes from Poole, and is of a greyish colour, but turns perfectly white when fired. Flint, which is pure silica, can only be used after being calcined and ground to a fine powder. In the manufacture of ordinary earthenware blue clay is the foundation and flint the whitening medium. Cornish or china clay also conduces to whiteness, and renders the mass more porous, while Cornish stone increases the density of the clays and acts as a flux. When the ware is in the "biscuit" state patterns are printed upon it if required. Glazing is the next process, and after being kept for about 15 hours in the "glost ovens," enamel colour may be laid on. The burnishing of gold ornamentation, when this is employed, is the final process. In the studio of M. Solon, who was formerly in the Sèvres factories, is to be seen a process of ornamentation called "pâte sur pâte." In this method the clay is laid on by means of a brush and then worked with tools, and the artist is, of course, his own designer. Upwards of 1000 persons are employed in this establishment.

Nottingham, visited by the writer on the occasion of a garden party given by Mr. S. W. Johnson, President of the Institution of Mechanical Engineers, was not seen under the most favourable auspices. A special train, provided by the courtesy of the Midland Railway Company, arrived from Derby in the midst of a thunderstorm, accompanied by a downpour of rain, worthy of the best traditions of Manchester or of Glasgow. In the station portico a large number of members, accompanied by many ladies in gay attire, sympathised with the heroic efforts made by a solitary cabman to transport the party to Nottingham Castle. The belief was openly expressed by some rash individual that a second cab existed in the town, but this opinion met with very few supporters.

In spite of the unpropitious weather and its attendant difficulties, there was a very successful and enjoyable gathering, and when the sun finally reappeared, it was possible to wander in the charming grounds by which the Castle is surrounded. Standing on a precipitous rock, some 200ft. in height, the Castle commands a fine view of the Trent valley east and west. The

present building, although a good example of classical Italian Architecture of the Jacobian period in England, cannot be said to be appropriate in any way to the splendid position it occupies. Built on the site of an ancient Norman Castle and Fortress, Nottingham Castle was commenced in 1670 by William Cavendish, first Duke of Newcastle, and was attacked and burnt during the Reform riots in 1831. Restored through the energy of the late Alderman W. G. Ward, and with the help of Mr. Gladstone, it was adapted by the Corporation for the Municipal Museum and Gallery of Decorative Art, and opened in 1878. The collections consist of pictures in oil and water colours, drawings, engravings, pottery, metal work, textile fabrics, sculpture, classical antiquities from Greece, Italy, &c.

University College, Nottingham, erected by the Corporation in a central position, is probably one of the finest piles of public buildings in the provinces. In design it is Gothic, and built of Ancaster stone. The college consists of a principal façade in Shakespeare Street with a central block containing lecture theatres, laboratories, &c. Technical schools and a Natural History Museum are connected by a corridor with the remainder of the college buildings, the whole of the structures being of uniform style. In the basement of the college are the carpentering shops and boiler house, on the ground floor mechanical workshops, testing, dynamo and lace rooms, plumbers' and smiths' forges; on the first floor a commodious lecture theatre, mechanical laboratories, hosiery and professors' rooms; on the second floor, drawing office, class rooms, and an industrial museum.

The Central Free Libraries and Reading Rooms are situated in the east block.

Electric light is used in the whole of the buildings, and from the Corporation Electricity Supply Station, opened in 1894, the lighting of the town is effected. In addition, there are upwards of 500 private consumers.

Welbeck Abbey formed the object of the final visit, and, after inspecting the new collieries at Cresswell, a large number of members drove to Welbeck, where they were hospitably received by the Duke and Duchess of Portland.

In conclusion, it may be remarked that the session is considered to be one of the most interesting and successful known in the history of the Institution, and that the liberality of the Midland Railway Company in connection with the meetings generally was thoroughly appreciated.

An interesting historic mansion is offered for sale at Versailles—that formerly occupied by Madame Elizabeth, the sister of Louis XVI.

The Liverpool School Board has instituted a limited competition of local architects for new schools to be built in Lawrence Road and Bowler Street. Ten firms of architects have been invited, five for each group of buildings, and the Clerk to the School Board will act as adjudicator on the designs submitted.

Memorial stones of Rhyddings Chapel, Swansea, have been laid. Mr. P. J. Thomas, of Bridgend, prepared the plans, and the contract was let to Messrs. Weaver and Co. The cost of the new chapel is to be about £1550. It is being built in the Gothic style of Architecture, and will seat nearly 550 persons.

Two new hotels are about to be built at Southwold. One, to be called the Marlborough, will be built on the North Cliff. Mr. Pells, of Beccles, is the architect, and the cost is £7000, without furniture. The second hotel will be situated near the railway station, and will cost about £2000. Mr. T. Key is the architect for this, and also for a south wing to be added to the Cliff Hotel in the same town.

An accomplishment has been made of the decoration of the vestibule and the dome of the Liverpool Town Hall, in accordance with Professor Simpson's designs. One of the finest pieces of sculpture in Liverpool is Francis Chantrey's graceful statue of George Canning, which occupies a pedestal which is placed on the first elevation of the grand staircase leading to the beautiful suite of upper rooms of the Town Hall.

The . . .
OCTOBER NUMBER
of the . . .
Architectural Review

is unique in the
Interest of its Contents.

So strong a Series of Articles and
Illustrations for the
Architect and Craftsman
has never previously been brought
between the covers of a Magazine.

One of the timely features
of the October Number
is the Second Supplement of
"THE COLLECTOR" Series
containing a special article on the

Rembrandt Exhibition

at Amsterdam:

"In Honour of
Queen Wilhelmina's Accession."

A fine reproduction of
Rembrandt's famous Painting
"THE NIGHT WATCH,"
adorns this Number.

A Second Plate
entitled

AN AUTOGRAPH LITHOGRAPH,

By Oliver Hall, R.E.,
is also presented; and
Other Features of the Number are:

WHAT IS ART?

By Count Leo Tolstoy.

**LONDON AS DICKENS KNEW
IT.**

**THE RENAISSANCE OF THE
ART OF ENAMELLING IN
ENGLAND:**

By Alexander Fisher.

**THE ROCK-CUT CHURCHES OF
INKERMANN:**

Letterpress and Illustrations by William
Simpson, R.I.

THE WORK OF G. F. WATTS:

Illustrated:

Written by W. E. F. Britten.

**17th CENTURY PLASTER-WORK
IN BARNSTAPLE:**

Illustrated.

**THE ROMAN STONES IN THE
HUNTERIAN MUSEUM:**

Illustrated.

THE WORK OF JOHN BELCHER:

Illustrated: Written by C. G. Harper.

The October Number of the REVIEW
is the most interesting Magazine ever
offered to the Profession.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
September 28th, 1898.

"I know what it is to live in a cottage with a
deal floor and roof, and a hearth of mica slats;
and I know it to be in many respects healthier
and happier than living between a Turkey
carpet and a gilded ceiling, beside a steel grate
and a polished fender. I do not say that such
things have not their place and propriety; but
I say this, emphatically, that the tenth part of
the expense which is sacrificed in domestic
vanities, if not absolutely and meaninglessly lost
in domestic discomforts and incumbrances, would,
if collectively offered and wisely employed, build
a marble church for every town in England;
such a church as it should be a joy and a
blessing ever to pass near in our daily ways and
walks, as it would bring the light into the
eyes to see from afar, lifting its fair height
above the purple crowd of humble roofs."—JOHN
RUSKIN.

NEARLY every Londoner has caught a glimpse
of the Elizabethan mansion lying amongst the
trees of Holland Park, and just visible from
the tops of the omnibuses plying along
Hammersmith Road. But very few have seen
the inside of Holland House. It is a fine
country house that has been swallowed up by
the all-devouring City; standing yet in the
midst of its own lovely grounds, and holding
its treasures intact. It has changed hands
repeatedly, and for years now has ceased to be
a social centre.

It dates, says an article in the new Pall
Mall Magazine, from the beginning of the
seventeenth century. It was a Royalist house
in Stuart times, but for a few months it was
the residence of Cromwell and Fairfax, then
of Addison in his last years, and, later still,
of William Penn. It passed into the hands
of the Fox family in 1749, and thenceforward,
for a hundred years, it was the fount of
Whiggism pure and undefiled, and it reached
the height of its fame under Macaulay's Lord
and Lady Holland, the Whig potentates of
the Reform epoch. The house is packed with
treasures of art and objects associated with
half the famous people of Europe during the
days of its prime. Macaulay, to whom it was
almost home, might well write of all its
memories, "mixed with all that was loveliest
and gayest in the society of the most splendid
of capitals."

SLOWLY, but surely, the officials are effecting
the clearance of the site in Parliament Street
which is needed for the widening of White-
hall and the construction of the new Govern-
ment offices. All the houses are now vacated
up to the corner shop in the occupation of the
Aerated Bread Company, and this will be
handed over in the course of the next few
weeks, together with the adjoining premises
facing Parliament Square. No time will be
lost in demolishing the buildings, so that
probably by the time the next Session opens
the entire block on the north side of Parli-
ament Street will have been swept away,
opening up a clear view of Westminster
Abbey.

PATRIOTIC wall-paper is the latest thing in
the United States, and, but for the decided
strength of the colouring, the designs are by no
means lacking either in originality or in grace.
One of these represents the spread eagle with
the crest of the States on its breast, the laurel
branch and bunch of arrows in its jaws, stand-
ing on a knot of ribbon which forms a festoon,
and from which depends a single star attached

to crossed representations of the Stars and
Stripes, which again serve to hold up more
ribbons, which are again carried in festoons to
smaller stars surmounted by flags. The frieze
represents the same design in an enlarged
form, swords and anchors attached to knotted
cables being artistically introduced, while the
border at the top and bottom represents the
network, which is commonly seen forming the
upper part of the bulwarks of a steamer.

SOME cities boast of being built on a rock,
others of having seven hills for their founda-
tion; but the residents will awake one morn-
ing to the fact that their world-famous
Metropolis is a city built on tunnels. So many
underground means of communication have
been, are being, or will be, made that London
will soon have little geological basis left.
Recently the Mansion House itself showed
several cracks; and now buildings along the
route of the new tunnel for the Central Rail-
way from the Royal Exchange westwards are
following its example. No danger of collapse
or accident is apprehended, the tunnels being
far beneath the foundations of the houses;
but still the fact remains that the cracks are
there. Probably when the strata have got
over the disarrangement caused by navvies,
and have settled down to their normal solidity,
the crevices will be filled up and painted, and
thus obliterated until the leases of the build-
ings expire.

REPORTS that houses and halls in Cheapside
were chipping and cracking on account of the
excavation for the Central Electric Railway
have been current lately. At the top of
Ironmonger Lane stands the Mercers' Hall, a
very old building. Adjoining it, nearer the
Cheap, is one of Messrs. Benetfink's establish-
ments. At the level of the first story of the
hall, just where it joins Messrs. Benetfink's,
there is a zig-zag crack about an eighth of an
inch wide. It was first noticed in July. Some
three weeks ago a piece of thin paper was
pasted across the crack. This paper is still
intact, showing it has not widened recently.

MESSRS. JONES AND LANG, house and property
agents, have their offices in King Street. Here
again cracks are visible. Mr. Taylor, of
Messrs. Jones and Lang, speaking as a practical
surveyor, says he has little doubt a small
subsidence has occurred. After the tunnel
archway is fully completed the ground settles
slightly, and then the harm is done. All the
buildings affected must be carefully watched
for some time longer, but the fact that there
had been no expansion of the cracks during the
last week or two, points, he said, to the cessa-
tion of the subsidence. It is hinted that the
cracks might be due to the excessive drought,
but this theory is disproved by the fact that
they appeared before the drought became
severe. Sir Douglas Fox, the eminent consult-
ing engineer, has been called in. It is under-
stood that he does not regard the matter as
serious now that three weeks have elapsed with-
out any widening of the cracks. The construc-
tion of the subways and underground railways
has caused buildings to crack and chip similarly
in other parts of London. The phenomenon
is familiar to engineers. Under ordinary cir-
cumstances it is not attended with danger.

THE Rector of Croyland, near Peterborough,
in appealing for funds for the preservation of
Croyland Abbey, gives an account of the work
done this year. "The two bays next the tower
rebuild, one entirely so; the north wall of the
north aisle or present parish church underpinned
on the outside face; a cross wall between two
chapels rebuilt, and the east window in the
tower repaired and cemented. I therefore
greatly need pecuniary help," continues the
Rector, "in carrying on this great work. Now
for the reason of the urgency of this appeal.
Last Wednesday the whole north wall of the
eastern chapel moved 3 in. to the north, and
must be speedily taken down and rebuilt from
the foundations, as in the case of the two bays
next the tower. The sum still required is
about £1100. The portion of the abbey which
has caused so much work this year was built
by Abbat Ulketyl in 1061. In 1091 this

READY OCTOBER 1st.

1/- Nett.

portion suffered from fire during the abbacy of Ingulphus the Historian.

"THERE are many reasons for this decay to the fabric besides age and the drainage of the Fens. The abbey has suffered from fire on three occasions, from earthquake (1114), and the walls were built on the peat bed, having no spreading footings. The foundations are perfectly rotten, and how the building has held together for so many centuries is truly a mystery. One relieving arch was embedded only about 1 in., having a projection of 6 in. Dangerous in the extreme. In the peat bed last week we found a cluster of oysters unopened. The underpinning of the abbey proves the statements by Ingulphus to be perfectly correct, and the oak piles may be seen by visitors which have been since 947 A.D. the stay of the foundations. I do pray that the lovers of the ancient monuments of our land may help me by a generous response to this letter."

RAWMARSH Parish Church has been thoroughly restored, and very extensive alterations have, at the same time been carried out. The work of improvement—if improvement it be—was in some degree a matter of necessity, but when the primary work of renovation was begun its incompleteness was very marked, and so the scheme was enlarged, and eventually embraced the erection of a new chancel, the provision of a vestry and an organ chamber in addition to the complete repair of the nave. It is rather more than two years since Mr. J. Platts, the architect who has had the whole of the work in hand, pronounced the roof of the nave to be unsafe, and his investigation proved most of the timbers to be decayed. A new ceiling of pitch pine, roofed with Westmoreland slates, was put in, and during the course of the work it was discovered that the walls of the clerestory were damaged. These were therefore repaired. The old galleries were taken out, and then it was seen that one of the stone pillars of the nave was cracked down its entire length, and a new one had, of course, to be put in its place.

THE new chancel, which is much larger and more elegant than the chancel it superseded, is of octagonal shape, and contains a stained glass window. The floor is laid with encaustic tiles, and new altar standards and rails have been provided. The nave has been newly floored, and seated with pews of pitch pine, slightly stained oak colour, with worked and traceried ends. The hexagonal pulpit is of the same material as the pews, and is supported by traceried pillars, with open work above. All the internal stonework has been cleaned of the whitewash which formerly disfigured it, and new windows of cathedral glass have been inserted. The new chancel arch is of Roche Abbey stone, with old English carved capitals. The alterations have required a rearrangement of the heating system, which has also been renovated, and the total outlay necessitated has been about £2000. A new organ to be placed in the church is being made by Messrs. Abbott and Son, of Leeds, at a cost of £500.

REFERRING to the action of the London County Council with regard to the means of escape from factories in the event of an outbreak of fire, the City Press says:—"The provisions of the Act itself are unobjectionable. In old buildings as well as in new it requires only that such facilities shall be provided as can reasonably be required under the circumstances of each case. What is reasonable under the circumstances is unfortunately left in the metropolis to the decision of the County Council. We say unfortunately, because the Council's ideas as to what is reasonable in old structures are peculiar, so peculiar that in a large number of instances the perfectly legitimate requirement of the Act has been magnified into an oppressive and in many cases intolerable demand. We had hoped that the remonstrances which have been made by persons carrying on business in the City and elsewhere in Central London would have induced the Council to modify its require-

ments, and that we should have heard no more of the 'County Council Staircase,' the insistence upon which without regard to special circumstances has been the ground of complaint.

"It appears, however from the proceedings taken against Messrs. Blades, East, and Blades that it has not yet learned the wisdom of moderation. The firm's premises in Tabernacle Street are, of course, quite modern, and the neighbourhood has been within the last few years the scene of a terrible fire; but we do not think it was the intention of the Legislature that they should be put to the expense of carrying out the alterations now insisted upon. The Council requires two staircases of incombustible materials to be erected, the cost of which, as shown by the contract entered into by the firm, will be no less than £660. To this outlay Messrs. Blades, East, and Blades, after a lengthened correspondence, consented. The summons was taken out by the Council because there had been some delay in commencing the work, and the case has been adjourned for ten weeks for the alterations to be carried out. These, however, are mere details, which are of little interest to anybody excepting the parties immediately concerned. The serious feature of the case is the large expenditure which the London County Council has power to compel firms to incur for alterations, and its apparent disregard for those reasonable considerations which the Act recognises. We have nothing to say against County Council staircases when they are made obligatory in the construction of new buildings. What is objected to, and rightly looked upon as a hardship, is the insistence upon their introduction into existing buildings regardless either of necessity or expense."

THE announcement that the directors of the Grafton Galleries are about to hold an exhibition of Verestchagin's pictures will be of immense interest to English people. It will succeed the exhibition of the Society of Portrait Painters, and is expected to open on January 1st. The Russian soldier-artist burst like a bombshell in the world of Art some years ago. The first show of his pictures in this country made a prodigious sensation, and gave rise to a fury of denunciation, and a corresponding passion of praise. He has painted modern warfare as it has never been painted by any other man. He is an artist of astonishing force, and a realist who shrinks from nothing.

No one who saw Verestchagin's trio of pictures representing what the glory of war means for the private soldier can ever forget them. The first was an expanse of blue sky with a great snow-capped mountain in the foreground. No sign of war—nothing else in the picture save a small brown speck, apparently some sort of bird. The second picture was a lower scene on the same mountain. There is less of blue sky, the snow-capped peak has receded into the distance, and the brown, bare, barren lower slopes, flecked with the shadows of passing clouds, form the foreground. But the little speck has grown into a huge, repulsive-looking vulture. In the third picture we are presented with a dense tangled mass of green tropical jungle. It is at the foot of the vast Himalayas. In the foreground lies a young British soldier—dead. His dead hand still grasps his rifle, and round him sit in grim array a number of vultures, which have just alighted to gorge themselves on the flesh of the soldier lad.

ANOTHER trio, showing how great empires are maintained, was likewise very impressive. Three startlingly realistic pictures of great power showed the world how Rome, Britain, and Russia maintained their hold over their subjects. The first was a picture of the Crucifixion, the second depicted British artillerymen at the close of the Mutiny, blowing natives out of the mouths of guns, the third represented the execution of a Nihilist in a snowstorm. All were grim, terribly grim, and very powerful.

WAR was one of Verestchagin's favourite subjects, especially the Russo-Turkish War of 1876-77, in which he had himself taken part. Who does not remember "All quiet on the Schipka?" The conquest and retention of the vast domain of India, with all its glories and its wealth, and its millions of inhabitants by a mere handful of an energetic western race also appealed powerfully to Verestchagin's wonderful imagination, as it does to most Russians, whose eyes are on the Orient. The coming exhibition of Verestchagin's works will teach many Londoners somewhat of the new literary and artistic forces that are struggling to express themselves—the product of the emergence of a race from barbarism and childhood to civilisation and maturity. To have produced Tolstoy, Tourgenieff, Marie Bashkirtseff, and Verestchagin is to have challenged comparison with the Elizabethan age.

MR. ARTHUR HODGSON, Chairman of the Executive Committee, Shakespeare's Birthplace, has replied to the Times correspondent "W. L.," who, in speaking of Shakespeare's house and Anne Hathaway's cottage, remarked: "When I last saw the birthplace the great danger of its being burnt was in consequence of the hot-water pipes resting on the very old and very dry timber." "The boiler which feeds the hot-water pipes," Mr. Hodgson explains, "is fixed in a separate building at a distance of 80 ft. from the birthplace, and is worked by low pressure, seldom, or ever, at boiling heat. Iron rollers are used for the hot-water pipes, they avoid the woodwork made of solid oak. Last year the pipes were thoroughly overhauled and the circulation perfected by an experienced tradesman. The lightning conductors were at the same time tested and put in order. In answer to another correspondent in your issue of the 13th inst., I may say that the hot-water pipes do not affect the plaster, upon which some thousands of visitors' names have been pencilled (this custom no longer is permitted). It is true that the limewash on the plaster surface is liable to peel off with age, but the equal temperature produced by the hot-water pipes assists to preserve it.

"In regard to Anne Hathaway's Cottage, the dear old lady who is the custodian, and who is a lineal descendant of the Hathaways, has lived there fifty years, and under present arrangements resides in the cottage, which last year was thoroughly and carefully restored at a considerable cost. The birthplace and Anne Hathaway's Cottage are under the management of an executive committee, consisting of the mayor, three aldermen, and six prominent residents in the borough, who are appointed at the annual meeting of the trustees on the anniversary of Shakespeare's birthday (old time). Since the lamented death of Mr. Charles Flower in May, 1892, I have had the honour of having been elected annually chairman of the executive committee, who meet monthly on the first Wednesday in the month, the birthplace being constantly visited by myself and other members of the committee, who take the deepest interest in the sacred trust committed to their care."

It is not easy to think of the long-lost Gainsborough—the discovery of the missing Duchess in a Chelsea cellar was reported by the Daily Mail the other day—as anything but a kind of sea-serpent, whose outlines "fade for ever and for ever" as we come nearer. The mystery of the Chelsea cellar makes a pretty story of a find: so pretty that it ought to come true. The painting, we are told, "has been floated from canvas to paper." Has it, indeed? Here, at least, is a curious and instructive point, which we are pleased to note. "Floated" is an original word in this connection. It seems to imply that the author of the tale is sufficiently unacquainted with pictures to be tricked by a mare's nest. That flotation from canvas to paper is odd. The re-lining process is common enough; not, however, from canvas to paper, but the other way about.

THE N.A.P. Windows.

IMPORTANT ANNOUNCEMENT.

THE thorough and unanimous satisfaction which has now been expressed by Architects, Builders, and Users on behalf of the N.A.P. Windows, in most cases after prolonged trials, is causing them to be almost generally specified, and to make preparations for promptly executing the orders already in hand and shortly to accrue as the result of the N.A.P. Specialities having been specified for a long list of important buildings now in course of erection and being designed, arrangements have been concluded for acquiring the undertaking from the *Development Syndicate* (The N.A.P. Window Co. Ltd.) by a *Trading Company* possessing a working capital suited to the importance of the business.

THE PROSPECTUS OF THE (NEW) N.A.P. WINDOW COMPANY Ltd.

Will be next week published in the Daily Press on the 4th, 5th, and 6th October.

EXTRACTS FROM THE PROSPECTUS:

There are seventeen British Patents included in the purchase, the principal of which, and their respective advantages, are as follows:—

SLIDING WINDOWS.

- (a) "The N.A.P. Sliding and Revolving Sashes," which (hung with lines and weights in ordinary hollow sash frames) slide as usual, and when their outsides have to be cleaned or repaired, can be instantly reversed for the purpose.
- (b) "The N.A.P. Weightless Frame," for hanging either the N.A.P. Revolving Sashes or ordinary sashes in solid frames without the use of the ordinary lines and weights (one sash counterbalancing the other), or for hanging therein ordinary sashes in basements, &c.
- (c) "The N.A.P. Top Bolt Patent," which consists of an ordinary window, the sashes of which, by the application of certain inexpensive fittings, can easily be drawn inwards by a domestic servant, when it is desired to clean the outsides.

CASEMENT WINDOWS.

- (d) "The N.A.P. Wood Casement," which not only opens outwards for Ventilation, but also inwards for Cleaning.
- (e) "The N.A.P. Metal Casement" (6 different methods) each of which also open outwards for Ventilation and inwards for Cleaning.
- (f) "The N.A.P. Passable Hopper Cheeks," which enable bottom-hung fanlights, fitted with side-glazed cheeks for the prevention of lateral draught, to be inwardly swung down to a vertical position for convenient cleaning of the outsides of the Fanlights.
- (g) "The N.A.P. Accessories," which consist of a number of useful inventions connected with the details of windows; and all of which are capable of producing handsome profits.

Full size examples of the above can be seen at the Company's Showrooms, 159, VICTORIA ST., WESTMINSTER, and 65, GRACECHURCH ST., E.C.

Although the Patents have for some time been introduced to the Building World, no question of validity has been raised. The favourable opinion of Mr. Fletcher Moulton, Q.C., M.P., has been obtained with reference to the principal inventions, which are designated by the letters (a), (c), (d), (e), and (f) in the above list. Mr. Moulton's opinions were based upon an exhaustive search (extending from the year 1617) by Messrs. Alexander Browne and Co., Registered Patent Agents, 9, Warwick Court, Holborn. The originals of these reports, and the opinions as above mentioned of Mr. Moulton, can be inspected, together with all other legal documents, at the offices of the Company's Solicitors. Both the United States of America and Germany have granted patents; facts which are strong confirmatory evidence of validity, having regard to the fact that the Patent Authorities of these countries search the Patent Records of the World for inventions which anticipate current applications.

The Company will also take over, at the expense of the Vendors, their rights in the following Foreign and Colonial Patents, which have either already been granted, or in respect of which instructions to the Patent Agents to apply for patents have been given; and it is proposed almost immediately to form a Subsidiary Company for their purchase, upon terms which should provide this Company with an immediate substantial profit.

Copies of the Prospectus, with forms of application for Shares, can be obtained at the Offices of the Company, or from the Bankers, Brokers, Solicitors, or Auditors.

Professional Items.

ABERAYRON.—The Aberayron school buildings, which have just been opened, are built on a commanding site near the Feathers Hotel. They are unpretentious. The buildings consist of a spacious central hall, two class-rooms, master's and mistress's rooms, workshop, laboratory, music room, &c. The architect is Mr. L. L. Bankes Price, B.A., of Lampeter, and the contractor Mr. E. Evans, of Llanybyther.

CARDIFF.—The Mayor of Cardiff has just opened the new premises in George Street for the Free Library for the Docks district. The building has been erected on the site of two cottages in George Street, and has been designed with a red brick front and a simple treatment in the Tudor style of Gothic Architecture. The roof over the back part of the library is vulcanite, manufactured by the Vulcanite Roofing Company, Belfast, under the supervision of Mr. W. Allen, of Cardiff, the top of which, covered with sand and gravel, forms a good drying-ground for the caretaker. The buildings have been erected by Mr. W. T. Morgan, contractor, Cardiff, from plans prepared by and under the supervision of Mr. W. H. Dashwood Caple, architect, Cardiff. The floor of the library is formed of wood blocks. The furniture has been made and supplied by Messrs. Turner and Sons from the drawings of the architect. The buildings are lofty and well lighted, and simple and excellent arrangements are made for the supply of fresh air and the extraction of the vitiated atmosphere. The total expenditure on the buildings was £1400, and the acquirement of the cottages cost £800.

CHARLEVILLE.—The foundation stone of the new Church of the Holy Cross, Charleville, was laid a few days ago. As the result of a limited competition, the design of the new building was entrusted to Mr. M. A. Hennessy, architect, of Cork; the contractor being Mr. Denis Creedon, of Fermoy. The style of Architecture is that of the thirteenth century, pointed Gothic, which lends itself with peculiar charm to the plan, which includes nave, aisles, transepts, and chancel. The main front is enriched by a moulded and recessed doorway, with two rows of pillars, and a statue of St. Colman, the patron of the diocese. The tower and spire, which are 150ft. in height, flank the nave gable on the left hand. From the belfry springs a graceful octagonal-pointed spire, flanked at the base by four spire-capped pinnacles, and the summit by a floriated wrought-iron cross, richly gilded and decorated. On the right-hand side of the north gable rises a pinnacled buttress. The tower door is on the side, deeply recessed, giving a good shadow. On the opposite side, leading to the adjoining aisle, is a graceful porch projecting beyond the walls of the church, with gabled frontages. The masonry throughout is of local white limestone, and the dressings, also of limestone, are from the famous quarries of Liscarrol. The total cost of the building is estimated at £14,000.

EARLS COLNE (Essex).—A new grammar school has just been opened at Earls Colne, Essex. The building is of red brick, faced with "Sible Hedingham" bricks, and covered with "Perfector" roofing tiles, obtained from Messrs. Thomas Peake, of Tunstall, Staffordshire. The windows are of the Elizabethan style, with leaded lights. Half-timbered work is employed under the eaves and in the gables. The floors are nailed into breeze concrete. The ceilings are of panelled plaster. The floors are carried on two iron girders, cased, placed on elaborate carved stone corbels. There are several winding staircases, with French polished handrails. The work has been carried out by Mr. Zach. Rogers, contractor, of Earls Colne. The figures of the original contract were £3700, but the extras, &c., will bring these up to upwards of £5000. Mr. Henry A. Cheers, of Twickenham, was the architect.

GILSLAND (Cumberland).—The new stone bridge over the Irthing at Gilsland has been completed. The bridge is built on the skew principle, and has cost £1400, including road diversions. The erection is in substitution of a narrow bridge with a square span and a very awkward approach on the left bank of the river. The bridge has been designed by Mr. G. J. Bell, Cumberland county surveyor, and built by Mr. Thos. Telfer, Langholm.

GLASGOW.—A new nurses' home has been added to the Gartloch Asylum, Glasgow. The new building will accommodate about fifty, and is to be of three stories, and built of red stone in the Francois Premier style of Architecture, similar to the main asylum buildings. It is quite detached from the asylum, and situated at a rather lower level in a pleasant part of the grounds. On each floor there will be sitting rooms, bedrooms, and bath rooms, while in addition on the ground floor will be matron's rooms, visitors' rooms, and kitchen. A sick room for invalided nurses will be found on the first floor. To ensure quiet for the night nurses, their quarters, reached by a separate staircase, have been placed in the top flat. The bedrooms will be of two sizes, and every nurse and servant will have a separate room in addition to sharing with others a parlour. The entrance to the home is placed so as to be equally convenient for asylum and hospital, and opening from it on one side is a parcel and enquiry room. The parlours, which have large bow windows, are placed at the corners, and the lavatories and bath rooms are in the wings. The ground behind, forming part of the old pleasure, will be laid out for nurses' recreation. The architects are Messrs. Thomson and Sandilands, and the contractors:—Messrs. Messrs. Paterson and Baldie; joiners, Messrs. Hutchinson and Grant; slaters, Messrs. A. M. Ross and Sons; plasterer, Mr. Mackenzie; plumber, Mr. J. L. Arnot; painters, Messrs. McCulloch. The total cost, including furnishings, it is estimated will be about £20,000.

GORSTY HILL.—The new schools at Gorsty Hill were opened on Tuesday week. The buildings, which can be used as day-schools and a mission church, have been erected at a cost of about £2000. The builder was Mr. W. Willetts, of Old Hill, and the architects were Messrs. Prothero and Phillott, of Cheltenham.

GOVAN.—The ceremony of laying the foundation stone of the Public Halls and Municipal Buildings in Govan Road, Govan, took place last Saturday week. The buildings are divided into two sections: first, the Burgh Building, comprising the Council Chamber, committee rooms, &c., and the offices for the various officials; second, the Town Hall, consisting of a large hall to accommodate 2000 persons, and a small hall to accommodate 500. The main entrance to the Burgh Buildings is from Govan Road, and placed in the centre of that frontage. On the left, immediately on entering, is the burgh officer's or enquiry offices, and on the right is a small waiting room. On entering the buildings a corridor is reached 8ft. wide, which joins the various departments of this floor to each other and to the Council Chamber. Immediately behind the corridor, in the centre, are two stairs: one leading to the right reaches the Burgh Surveyor's office, on the first floor facing Merryland Street; while the other, to the left, reaches the Sanitary Inspector's office, &c., fronting Summerton Road. The Council Chamber is placed at the rear of the main building, and directly in the axis of the main entrance door. This position was decided upon, after careful consideration, as being most convenient to the main entrance, and placed at the back the noise from the street will not disturb the business of the Council. Double doors have also been provided to keep out the sound. A retiring room, lavatory, and ante-room have also been provided, whilst space has been set aside for the Press, and also a gallery with separate entrance for the public. Along the Govan Road frontage are placed the Provost's room, committee rooms, library, and waiting room. The Town Clerk's office faces the Summerton

Road, while the Weights and Measures office has a frontage to Merryland Street, and in the basement under the office connected to the street by a hoist is a workshop, measure-testing room, and a fire and damp-proof room. The Burgh Treasurer's office faces Summerton Road, and is provided with a separate entrance for the public, and is also connected to the other offices by a corridor. The Town Hall extends along Carmichael Street from Summerton Road to Merryland Street, the main entrance being in Summerton Road and the artists' entrance in Merryland Street. There is a wide corridor along each side of the hall, with sufficient exits to allow the hall to be emptied in a few minutes. There is also a cloak room, smoking room, and lavatory accommodation over the entrance hall and in the gallery. There are no columns on the floor of the hall, and therefore no obstruction to the view or circulation. The small hall is on the first floor. The public enter by a wide and easy stair at one end, and the artists by a stair at the platform end, where there is also two dressing rooms. The idea aimed at in the exterior of the building is to give it a plain but dignified appearance without lavish expense and ornament, the style adopted being a free treatment of the Classic. The detail of the large hall is a little different from the rest of the building, so as to make it distinctive. The estimated cost of the new buildings is £30,000.

KILMARNOCK.—The foundation stone was recently laid, at Kilmarnock, of a public library and museum. The building is being erected at Elm Bank, and is estimated to cost upward of £11,000. The style of Architecture adopted is Italian, the leading feature of the design being a portico at the main entrance, surmounted by the figure of Britannia and the Kilmarnock coat of arms. The frontage is 138ft. in length, with a depth of 114ft. On the ground floor are the reading room, library rooms, and lecture hall. On the second floor the main staircase leads to a spacious vestibule with dome of coloured glass, to the right and left of which are the wings of the museum, each having a total area of 1750 square feet. The architect is Mr. R. S. Ingram, and the principal contractor ex-Bailie Calderwood.

KESWICK.—A new High School and hostel erected at Keswick at a cost of £6000 has just been opened. The new buildings, which are adjacent to Greta Hall, the former residence of the poet Southey, have been erected in accordance with the designs of Messrs. Austin and Paley, of Lancaster, the contractor being Mr. Isaac Hodgson.

LEEDS.—The contract for the new premises of the London and Midland Bank, situate in North Street, has been let to Messrs. Craven and Umpleby. The work is being carried out from the plans and under the supervision of William Bakewell, F.R.I.B.A.

NEWCASTLE.—The new Presbyterian Church of England at Benwell, Newcastle, has just been opened. The building stands with its side to Armstrong Road, the west front facing Hugh Gardens. The hall occupies the eastern portion of the site, and between the church and hall the class rooms and vestries are placed. The church is planned with nave and aisles, the aisles and west end having galleries, the whole providing seating accommodation for 650. The entrances are placed in the west front. The whole of the block of buildings is designed in the Early English style; the walling is of local stone, in coursed rock facing, with chiselled stone dressings, the bays of the nave having buttresses at every principal, and the alternate bays having the upper windows carried up as dormers. The west front has two projecting porches with mullioned and traceried window in gable over the same, and to the north a small octagonal turret breaks the line between the gable and staircase roofs, a buttress marking the southern division. Internally, the nave is divided from the aisles by an arcade of five bays on either side, and the east gable has a traceried rose window. The architects are Messrs. Badenoch and Bruce, of Newcastle. The estimated cost of the new building is £5500.

Enquiry Department.

LEGAL.

Enquiries involving legal points are dealt with below. These enquiries have been submitted to counsel (whose opinion we give in each case), and as the wheels of the law proverbially grind slowly, we are sure our correspondents will pardon the slight delay that has occurred in replying.

A PARTY-WALL NOTICE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly say in your next issue who has, in the case of a party-wall notice, to pay the adjoining owner's architect's fees—the adjoining owner or the building owner?—Yours truly, H. B.

"H. B." has not explained what he means by "a party-wall notice," but speaking generally, the adjoining owner must pay his own architect's fees.

TENANT'S RIGHT TO REMOVE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you inform me if I can legally remove a wooden erection, put up by me and used as a cycle shed? The structure is a lean-to, and is secured to the property by means of six holdfasts, and the door cheeks are dowelled into flagging of yard. It is cement flashed on two sides, and has been erected some twelve months ago, having first obtained the landlord's permission to do so. Thanking you in anticipation.—Yours faithfully, "CYCLIST."

If "Cyclist" is engaged in trade and put up the shed for the purpose of his trade, it is legal for him to remove it during his tenancy, but not otherwise.

AN UNFULFILLED ENGAGEMENT.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—A short time ago I prepared plans for some houses for A. Since then I find he has placed the work with B, and denies ever having engaged me. As he called at my office and we went to measure up the site together, is not that sufficient evidence of his having engaged me, and could I not sue him for expenses in preparing preliminary plans and surveying site?—Yours truly, "YOUNG ARCHITECT."

If A requested "Young Architect" to prepare plans without any stipulation that they were not to be paid for unless adopted, "Young Architect" is entitled to sue for the value of his work. His case will be corroborated by the fact of A having called upon him at his office, and having gone with him to measure up the site, but these circumstances, though strong evidence of A having engaged him, will not be sufficient evidence of the terms of the engagement.

REINSTATED WORK.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should be much obliged if you can give me legal advice on the following matter: In April, 1897, I contracted to erect some buildings, the amount of the contract being nearly £19,000. When the buildings were in construction and nearly completed a fire occurred which did damage to the extent of £3000. Of course the building was insured jointly with myself and the proprietors, and the insurance company paid the claim (I may mention that I paid the premium for insurance), the proprietors receiving the amount from the insurance company. I also took out the quantities for the fire claim, and, together with an assessor, who has to be paid out of the amount received from the insurance

company, dealt with the insurance company assessor in respect of same. In the interval between the commencement of the contract and the time of the fire materials had advanced in price, and the schedule for the fire claim was, therefore, of course higher than the original schedule of the contract. No arrangements were made with regard to how the reinstatement was to be paid for, and I assumed I should receive the amount the insurance company paid, less any expenses incurred by the proprietors. I have reinstated the work and completed the contract, and the architects wish to measure the work damaged by fire and price the whole on the original schedule. I should like to know if they can legally do this; if so I shall lose money on the reinstatement, while the proprietors will have a good balance in hand after paying all expenses.—Yours faithfully, J. D.

In the absence of anything in the contract to the contrary, "J. D." having paid the premiums out of his own pocket, would be entitled to the amount received from the insurance company; the proprietor would be a trustee for him of whatever the property received from them unless the policy, "J. D.," would be bound to reinstate, and entitled to be paid only the price as regulated by the original schedule.

AN UNJUSTIFIABLE DEDUCTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As readers of the "Builders' Journal and Architectural Record," we should be much obliged if you could give us a legal answer to the following:—

We undertook a contract of £1400, to be completed by December; it was not completed until February—the end of the month. The proprietor set the stonework in a separate contract, causing us to wait for stonework, as we had no control over it. The proprietor also sank two wells and fixed two pumps and water-pipes over our house, also added a water-closet, which caused us to wait both for plans and plumbers. He also added a considerable amount of work to contract, making a bill of extras considerably over £100. Four of the houses were occupied on February 3rd, two on February 19th, and one on March 12th (this was waiting for shop-fittings extra to contract), and one in February (21st); this one could have been occupied earlier, but they had it papered and colour-washed extra to contract. When we came to settle up, the architect and the proprietor wanted to deduct us £20 for not being completed by time. We should be extremely obliged if you could answer legally whether the proprietor has the power to do so or not.—Yours faithfully, THOS. ORTON & SON.

In the absence of something special in the contract, the proposed reduction is quite unjustifiable.

A QUESTION OF COMPENSATION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A, the contractor for B, is carrying out extensive building operations to property adjoining that which belongs to C, and A, in working to the drawings, excavates on B's premises and close down by C's wall to such a depth as to cause the wall belonging to C's establishment (the foundations of which are only about 4ft. below floor level) to crack, damaging plaster framing of windows, sills, etc., owing to the foundations settling. A has promised to make all good. Cannot C claim compensation for depreciation as well as make A put the drainage right? If the extra depth of excavations on B's property had not been done, there is no doubt the drainage to C's property would not have taken place. The architect for B holds the contractor responsible for all drainage to adjoining property. A has been told that compensation would be required, but he will not entertain the idea. Please say if C can compel A to give a reasonable amount for compensation.—Yours truly, "REVIEW."

If A is liable at all, he is liable for the depreciation. But in general such a liability

does not arise unless the building in question has been in existence for twenty years before the settlement takes place.

GENERAL.

VENTILATING ROOFS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A building, 70ft. by 26ft., is to be covered by a hipped roof, 45 degrees pitch, boarded, felted, and tiled. There will be a plastered ceiling at the plate level. The interior of the roof will not be made use of. How can I ensure sufficient ventilation for the preservation of the timbers in a thoroughly concealed manner? There may be no projection beyond the ridge line or plain of the roof.—Yours faithfully, "AIR."

Ample ventilation may be secured in a hipped roof with visible eaves by leaving a space between the top of the wall (in line with the underside of plate) and the under surface of the boarding. Should fascia and soffit boards be used to cover the ends of the rafters, bore a few $\frac{1}{4}$ in. holes through the soffit boards or insert a small iron grating flush with the face. In the case of parapet fronts, omit the boarding below the gutter, and insert an "air brick" in each parapet wall. Leave an inch space on each side and end of tie-beam, and an "air brick" is sometimes built in opposite as additional precaution. It is advantageous to the boarding to batten on top of the boards, and stretch the felt on the battens instead of laying it directly on the boards. If the above is not clear, write again; a sketch shall be prepared.

Views and Reviews.

CITY OF LONDON COLLEGE.

The student of engineering, surveying, or sanitation, in need of a school in London wherein to pursue his studies during the coming session, may be recommended to obtain a copy of the recently-issued calendar of lectures and classes in the engineering department of the City of London College (White Street, Moorfields, E.C.). With a successful record behind it, this engineering school is entering on another session full of hope and vigour. Professor Henry Adams is at the head of the department. Mr. Adams needs no introduction to a technical audience. His wide and valuable researches in Engineering and Architecture, of which a small library of thoroughly helpful text-books has been the result, together with his long and successful experience as a teacher, furnish assurance that his lectures during the coming session will be of the utmost value to the student, as lucid as they are thorough. The subjects dealt with may be categorised as under:—Technical drawing, building construction, practical sanitary science, sanitary engineering, civil engineering, mechanical engineering, quantity surveying, valuation, land surveying, engineering field work, town surveying, laying out building estates, and compass traversing. The prizes obtainable as the reward of good work at the City Polytechnic should not only act as a stimulus to the present students, but should swell the number of those who avail themselves of the very excellent facilities offered at this institution.

A STAINED-GLASS window has been placed in St. John's Church, Brooklands, as a memorial. The window has been prepared from cartoons drawn by the late Sir Edward Burne-Jones. The design is symbolical of the Ascension.

It is in contemplation to demolish the modern part of Whitgift's Hospital of the Holy Trinity, in North End, Croydon, in order to improve the thoroughfare at that point. Mr. Alderman Rymer, chairman of the Whitgift Governors, states that the modern part is in a very dilapidated and unsatisfactory condition, while the original building is "as sound as a rock." The latter will in no wise be affected by the proposed demolition, nor will any injustice be done to the almspeople.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BISHOP AUCKLAND.—For levelling, paving, &c., New-street, and Oakley-street, West Auckland, for the Rural District Council. Mr. C. Johnston, surveyor, 1, Cradock-street, Bishop Auckland:—

G. Hetherington ... £494 16 0
S. Walker ... 480 8 0
G. H. Bell ... 416 12 8
T. Hilton, Bishop Auckland (accepted) ... 416 0 0

BLACKBURN.—Accepted for the erection of a palm house and conservatories in the public park:—

Lockerie and Wilkinson, Ltd., Birmingham £1,495

CAMBRIDGE.—For erecting professors' houses at Westminster College, Cambridge. Mr. Henry T. Hare, architect, 13, Hart-street, Bloomsbury-square, W.C. Quantities by Mr. G. Fleetwood, 3, New-court, Lincoln's Inn, W.C.:—

Wm. Sindall ... £4,125 W. Bell and Son ... £3,998
Samuel K. Haliday ... 4,050 Wm. Saint (accepted) ... 3,376

CHELMSFORD.—For the erection of a laboratory and workshops, King Edward's Grammar School. Mr. Charles Pertwee, architect, Chelmsford:—

H. Potter ... £571 2 6 F. Johnson, Chelms-
Bunning and Son ... 536 0 0 ford* ... £528 10 8

CHELMSFORD.—For the erection of a small house in Queen's-road, for Mr. Bickmore. Mr. R. Mawhood, architect:—

W. Samms ... £248 W. Fincham ... £345
F. Johnson ... 345 J. Gowers (accepted) ... 328

CLACTON-ON-SEA.—For the erection of a cottage hospital, for the Committee. Mr. J. W. Martin, architect, Station Chambers, Clacton-on-Sea. Quantities by Mr. J. Kennard, 2, Devonshire-square, E.C.:—

Symes ... £2,475 Everett and Son, Col-
Dixon ... 2,412 chester* ... £2,250
McKay ... 2,380 Green and Hussey ... 2,058

DUBLIN.—For the erection of a residence for the Work-house Master, for the North Dublin Union Guardians. Mr. Denis J. Morris, architect, 24, Cabon-road:—

Pemberton and Son ... £2870 H. J. Monks ... £2800
J. Whelan ... 830 M. Glynn, Dublin* ... 789

ELLON (Aberdeen).—For additions to Gordon Hospital, for the County Council:—

Masonry.—Angus McDonald & Co., Aberdeen £400 0 0
Carpentry.—Wm. Auld, Ellon ... 325 0 0
Plastering.—W. Sivewright, Ellon ... 118 12 0
Slatting.—F. McRae, Ellon ... 65 3 6
Drainage and Water.—Geo. Fraser, Ellon ... 197 0 7

ENFIELD.—For the extension of Bushill Park School, for the Enfield School Board. Mr. G. E. T. Laurence, architect, Bridge House, 181, Queen Victoria-street, E.C. Quantities by Messrs. Campbell and Son, Finsbury-circus, E.C.:—

Jennings & Grenfell ... £10,843 P. Banyard ... £6,995
A. Porter ... 8,260 W. Lawrence ... 6,791
W. Wilmot & Sons ... 8,127 H. Almond and Son ... 6,750

ENFIELD.—For the erection of a school and teacher's house, &c., for Sir Cameron Gull, Bart., M.P. Mr. T. Gambier Parry, architect. Quantities by Messrs. Northcroft, Son, and Neighbour:—

Benfield and Loxley ... £1,659 J. Bottrill and Son, Reading ... £1,475

HAMPSTEAD N.W.—For the erection and completion of a block of residential flats, to be called "Priory-court," Mazenod-avenue, N.W. Messrs. Palgrave and Co., architects, 28, Victoria-street, S.W. Quantities by Mr. Geo. Stephenson:—

Stephens, Bastow, & Co. ... £23,389 F. John Bennett ... £19,945
Allen and Sons ... 22,500 F. T. Chinchin ... 19,590
F. Gough and Co. ... 21,534 Smith and Sons, Nor-
wood, S.E.* ... 19,516

HEXTHORPE (Yorks).—For the execution of street works, for the Balby-with-Hexthorpe Urban District Council. Mr. George Gledhill, Surveyor, Council Offices, Balby, Doncaster:—

S. Roberts ... £1,533 8 2 G. Gledhill ... £1,424 12 1
G. Hall ... 1,471 15 4 G. Ellis, Balby ... 1,356 8 1

LEEDS.—Accepted for additions, &c., to two houses and shops, Nos. 115 and 117, Burley-road, for Messrs. Perkins and Co. Mr. F. Mitchell, architect, Albion-street, Leeds:—

Brick and Stonework.—C. Lucas and Son,
Roberts-place, Burley-road ... £386 6 5
Joinery.—Irving and Bristow, Chorley-lane
Plumbing.—Arthur Britton, Burley-road
Plastering.—Thos. Moore, Concord-street
Painting.—Alfred Roberts, Burley-street

LEICESTER.—Accepted for the rebuilding of shop premises in High-street, Leicester, for Mr. William Hill. Messrs. Simpson and Harvey, architects and surveyors, Leicester:—

Charles Wright, Leicester ... £550

LITTLEHAMPTON.—For the supply of 1,000 tons flints, for the Urban District Council:—

W. Stanbridge, Worthing ... 5s. 2d. per ton

LONDON.—For the erection of two blocks of flats, Trouville-road, S.W., for Messrs. Joyce and Hall. Messrs. Bochmer and Gibbs, architects, 11, Spring-gardens, S.W.:—

Turtle and Appleton ... £2,320 L. Whitehead and Co.,
Britten ... 9,900 Ltd. (accepted) ... £2,250

LONDON.—Accepted for the erection of engine and boiler-houses, for the City and South London Railway:—

L. Whitehead and Co., Ltd. ... £10,749

LONDON.—For the erection of two shops at Roslyn Hill, Hampstead, for Dr. T. G. Munyard. Mr. E. H. Sim, architect, 8, Craig's-court, Charing Cross. Quantities by Mr. J. G. W. Buss:—

Bywaters and Sons ... £3,760 (A. Bush ... £3,277
Holloway Bros. ... 3,580 (L. Whitehead & Co. Ltd. 3,265

LONDON.—For renovations, &c., at No. 3, Arlington-street:—

W. Holt and Sons, Croydon ... £1,907

LONDON.—For the erection of a factory at 17, Albion-street, King's-cross, N., for Messrs. Stephenson, Mager and Co. Mr. H. A. Emmett, architect, Monney-road, Tufnell-park, N.:—

Holliday and Greenwood ... £4,089
Extra for lead roof ... 129

Patman and Fotheringham ... £3,791
Extra for lead roof ... 87

Scriveners and Co. ... £3,129
Extra for lead roof ... 97

Ford and Son (of Brentford) (accepted) £2,985
Extra for lead roof ... 96

LONDON.—For erecting a warehouse at Bayer-street, Golden-lane, E.C. Mr. J. Groom, architect:—

H. Irving ... £5,344 W. Shurmer ... £4,221
Woodward and Co. ... 4,926 Mattock Bros. ... 4,571

Kilby and Gayford ... 4,836 Grover and Son ... 4,546
H. L. Holloway ... 4,793 J. Greenwood ... 4,533

LONDON.—For rebuilding Nos. 70 and 71, Shoe-lane, E.C. Mr. H. Knight, architect:—

Nightingale and Co. ... £4,493 Turtle and Appleton ... £4,000
Woodrow ... 4,370 Chase and Son ... 3,997

LONDON.—For erecting new premises at Hackney for the Hackney furnishing Company. Mr. J. Hamilton, architect:—

Marten and Sons ... £3,910 Snewin Bros. ... £3,393
J. Grover and Son ... 3,650 W. M. Dabbs ... 3,360

B. E. Nightingale ... 3,585 Jarvis and Sons ... 3,127
W. Smith ... 3,529 W. Shurmer ... 3,141

LONDON.—Accepted for the re-erection of houses and shop premises at Nos. 32 and 34, Leman-street, Whitechapel, for Mr. Louis Sampson. Mr. W. A. Longmore, architect, 7, Great Alie-street, E.:—

A. Brown, Commercial-road, E. ... £915

LONDON.—For the erection of a warehouse at Great Arthur-street, Golden-lane, E.C. Mr. J. Groom, architect:—

Woodward and Co. ... £2,494 Grover and Son ... £2,279
Kirby and Gayford ... 2,436 J. Greenwood ... 2,271

H. L. Holloway ... 2,390 H. Irving ... 2,268
W. Shurmer ... 2,366 Mattock Bros. ... 2,259

LONDON.—For wiring for electrical installation, together with electric bells, at Abbey Court Mansions, N.W. Messrs. Metcalf and Greig, architects:—

Sharp, O'Brien, and Co., Minorities ... £403

LONDON.—For heating on the Low Pressure System a house, conservatory, &c., in Carleton-road, N.W., for Mr. C. Cheswright:—

Sharp, O'Brien, and Co., Minorities ... £141

LONDON.—For the enlargement of the Poor Law Offices, Isleworth, for the Guardians of the Poor of the Brentford Union. Mr. W. H. Ward, architect, Paradise-street, Birmingham. Quantities by Mr. F. W. T. Miller, surveyor, 10, Delahay-street, Westminster, S.W.:—

T. Hiseock ... £1,296 Dorey and Sons ... £1,055
W. Wisdom ... 1,087 T. J. Messan, Twicken-
ham (accepted) ... 1,023

LONDON.—For the erection of a block of residential flats Mazenod-avenue, West Hampstead. Messrs. Palgrave and Co., architects, 28, Queen Victoria-street, S.W. Quantities by Mr. George Stephenson:—

Stephens, Bastow & Co. £23,389 F. T. Chinchin ... £19,590
Allen and Sons ... 22,500 Smith and Sons, Nor-
wood, S.E.* ... 19,516

CONTRACTS OPEN.

COUNTY OF HERTFORD.

TO BUILDERS AND CONTRACTORS.

NEW BRIDGE AT TOTTERIDGE.

The County Council are willing to receive TENDERS for the above WORKS.

Builders desirous of contracting for the works may see the drawings, specifications, agreement, &c., at the County Surveyor's Office, No. 41, Parliament-street, Westminster, S.W., between the hours of ELEVEN a.m. and FIVE p.m.

A copy of the bills of quantities and a form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the contractor upon the receipt of a bona-fide Tender and the documents which have been supplied to him.

Sealed Tenders, addressed to the Chairman of the Highways Committee, and endorsed "Tender for New Bridge at Totteridge," must be delivered under cover, to me, here, not later than FIVE p.m. on WEDNESDAY, OCTOBER 12th, 1898.

Such security for the due execution of the works as the Committee may require must be given by the contractor.

The lowest or any Tender will not necessarily be accepted.

URBAN A. SMITH,
County Surveyor.

No. 41, Parliament-street, S.W.
September 22nd, 1898.

THE BOARD OF WORKS for the LEWISHAM DISTRICT.

KERBING, TAR-PAVING, METALLING, and CHANNELLING WORK.

The Board is prepared to receive TENDERS for KERBING and TAR-PAVING the Footpaths and CHANNELLING and METALLING the roadway of Colfe-road (part of), Forest Hill.

The plan and specification of the work and form of contract may be seen at these Offices (Surveyor's Department) on or after the 27th instant, where printed forms of Tender and other particulars may be obtained.

The Tenders must be on the forms issued by the Board, enclosed in an envelope, sealed, and endorsed "Tender for Colfe-road," and must be delivered on or before FOUR o'clock on TUESDAY, OCTOBER 4th, at the Offices of the Board, and placed in the box there provided for the purpose.

The Board does not bind itself to accept the lowest or any Tender.

By order,
EDWARD WRIGHT,

Lewisham Town Hall, Clerk to the Board.
Catford, S.E.
September 1st, 1898.

HANWELL URBAN DISTRICT COUNCIL.

CONTRACT FOR BROKEN GRANITE.

The Council are prepared to receive TENDERS for the SUPPLY of BROKEN GUERNSEY or CHANNEL ISLANDS GRANITE, for the year ending March 31st, 1899, to be delivered free at any place on the roads within their District, i.e., the Parish of Hanwell.

Forms of Tender (on which alone Tenders will be received), contract, and sureties' bond can be inspected at the Council's Offices any day between the hours of TEN a.m. and TWELVE at noon.

Tenders, sealed and endorsed "Tender for Broken Granite," to be sent in to me, at the Offices of the Council, not later than MONDAY, OCTOBER 3rd, 1898.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 12th day of September, 1898.

By order,
WARREN S. JAMES,
Clerk to the Council.

Urban District Council Offices,
Hanwell, W.

URBAN DISTRICT COUNCIL of WOOD GREEN.

WORKS OF PRIVATE STREET IMPROVEMENTS.

The Urban District Council of Wood Green invite TENDERS for the MAKING-UP of King's and Western roads within the said district.

The plans, sections, and specifications may be seen, and forms of Tender and bills of quantities obtained, on application to Mr. C. J. GUNYON, the Surveyor, at the Offices of the Council, Town Hall, Wood Green, upon payment of a deposit of One Guinea, which will be returned on receipt of a bona-fide Tender.

Sealed Tenders, upon the form supplied only, to be delivered to me not later than FIVE o'clock p.m. on FRIDAY, 30th instant.

The Council do not bind themselves to accept the lowest or any Tender, and the accepted Tender will be subject to the sanction of the Local Government Board.

By order,
J. W. BRITTON,
Town Hall, Clerk of the Council.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON."

MONITOR.—"MIANOT."

CRUISERS.—"BROOKLYN," "CHICAGO."

GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING, (each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

SANITARY CONGRESS.

THE HEALTH EXHIBITION AT
BIRMINGHAM.

THE Health Exhibition, which opened yesterday—the 27th inst.—at Birmingham in connection with the Sanitary Congress, contains all the newest forms of sanitary appliances and apparatus and machinery relating to municipal and domestic sanitation. There are four divisions, and in the first science in relation to hygiene is illustrated. This is not one which claims a large representation, though bacteriology, chemistry, demography, geology, preventive medicine, and physics are all well illustrated. The British Institute of Preventive Medicine supply a number of cultures in tubes, and illustrate by their exhibits the different forms and methods of cultivation and specimens of various bacteria. In chemistry the exhibits embrace

CHEMICALS FOR DISINFECTING PURPOSES, and the antiseptic treatment of wood, iron, and building materials are demonstrated. The demography section is a departure at this exhibition which medical officers of health and others who draw and base their conclusions upon statistical information will no doubt find very interesting and helpful. The co-operation of medical officers and of various sanitary authorities in the country was invited, and a very hearty response has been made in the offers of statistics and tabulated diagrams which should prove a special source of instruction. The Geological Society, to turn to another section, has loaned a complete set of maps of local geological interest, and physics, as applied to plumbing and building construction, will be illustrated by the Hygiene Referendum from London with a series of models. Division B, which embraces hygiene and special classes, trades, and professions, is largely covered by the diagrams and drawings incidental to the demography section. Several authorities have sent plans in connection with

HOSPITAL CONSTRUCTION.

The prevention of accidents by means of safety windows, precautions against fire and engine boiler explosions, are also illustrated in this department. The third division, which embraces construction and sanitary apparatus, is really the heavy one of the exhibition, embracing as it does two-thirds of the exhibits in the hall. The division is divided into three big classes, the first taking in its scope building materials, construction, and machinery. Here the Silicate Paint Company and the Duresco Distemper Company are prominent exhibitors of their special materials for wall covering and ordinary decorative purposes. The Adamant Company are well represented, and Messrs. A. R. Dean, Limited, find a fitting place to illustrate their fibrous plaster work. The machinery and mechanical appliances include a variety of inventions in use by municipal authorities, Messrs Shones and Adams giving useful information in this department. In Class 2 there are exhibits to illustrate the methods of sinking artesian wells, deep wells, the filtering, the softening, and the purifying of water, a feature which will be quite up to date, and a very important one at a time when the water supplies of the country are so defective, and the question of

DOMESTIC AND PUBLIC FILTRATION

is so much to the front. The latest forms of water-closets, waste preventives, flushing tanks, and sanitary appliances too numerous to mention are included in this very large class, the leading firms in the country being among the exhibitors. The British Sanitary Company, of Glasgow, illustrate their system of dry earth closets, and in the treatment of sewage all the newest methods will be exhibited, including the septic tank, which is the outcome of the Local Government Board inquiry during the last 12 months. Heating, lighting and ventilation are covered in the third class of the division. Heating by gas, hot water, and steam are demonstrated by exhibits; and cooking apparatus are shown by several of the best known gas stove firms.

POWER PRODUCED FROM TOWN'S REFUSE.

MR. G. F. CHARNOCK, Assoc. M.Inst. C.E., lecturing at the Bradford Technical College on the subject of "Power Production from Town's Refuse," pointed out as a remarkable feature of modern civilisation the increasing ability of science to turn to commercial profit products which, considering the expense previously incurred in their disposal, might be described as worse than waste. As a striking instance, the utilisation of bye-products of gas manufactured might be cited, but even more remarkable were the results of the recent developments which formed the subject of the lecture. The filth and refuse which accumulated in many of the dark and dirty ways of great cities had hitherto been a prolific source of disease. It had now been proved possible not only to make this refuse provide a means of lighting the very darkness from which it was derived, but also contribute to the sanitary improvement of the same district by furnishing a constant supply of hot water for public baths and laundries. After condemning strongly the barbarous practice still adopted by many local authorities of tipping refuse of all kinds on vacant land on the outskirts of the town, the lecturer proceeded to demonstrate the possibility of making at no very extravagant cost destructors which would consume all refuse without danger to health. The history of the subject was then dealt with, and the various systems of furnace critically described, with especial reference to the installations at Hammerton Street and Sunbridge Road, Bradford. It was stated that Bradford was one of very few towns where practically the whole of the refuse has been destroyed by fire for several years past. An interesting account was also given of the destructors at Hamburg, erected by the Horsfall Syndicate Limited, of Leeds, who were also the contractors for the Bradford furnaces. One outcome of the late motor-car agitation was the steam dust-cart introduced by Thornycrofts, the celebrated torpedo-boat builders, several of which carts were in successful use in London. Methods of collection should certainly receive more attention, the present open carts being most obnoxious. Although destructors had been in use in many large towns of this country for fifteen or twenty years, the object had been solely to get rid of the refuse in a hygienic manner, and it was not until 1888 that Professor George Forbes suggested for the first time that the heat produced should be utilised in raising steam for the electric lighting of public streets and buildings. Professor Forbes stated in his lectures that if properly consumed the ash-bin refuse of any population was sufficient to give steam to furnish electric light at the rate of one lamp of sixteen-candle power per head of population for two hours every night of the year. That was certainly a bold statement, and, although it had not yet been realised, there were several towns where a considerable amount of power was being obtained from refuse burned in destructors. At Oldham, for instance, by means of two Lancashire boilers, as much as 300-horse power had been supplied from the destructor works to the borough electric lighting station adjoining. Other similarly successful examples were described, and it was stated that at Plymouth a combined destructor plant is in course of erection for producing power for working the electric tramways. At Shoreditch, London, the experiment had been tried on a very large scale, which had now been in successful operation for more than twelve months. About 20,000 tons of refuse was consumed annually, and, without the assistance of any other fuel, 200-horse power was obtained with ease, and was utilised in lighting the main streets, the town hall, and other public buildings, while, in addition, a quantity of hot water was supplied to the public baths and wash-houses erected by the vestry.

THE Town Council of Bristol has rejected the scheme for providing docks at Portishead, at the estimated cost of £360,000.

Plymouth's Water Undertaking.

WHILST the London County Council has been casting envious glances towards the watersheds of Dartmoor, the authorities at Plymouth have been doing something of a much more practical order, and last week great jubiliations took place there over the completion of a huge scheme for securing to a population of nearly 200,000 for all time an abundant supply of pure water. Not that there is any scarcity of this much-needed commodity at present, for throughout the dry summer of this year there has been no appreciable diminution in the flow of water from Dartmoor. The necessity, however, of

PROVIDING A RESERVE STORAGE

has fully been appreciated, and last week a costly undertaking, designed to meet this necessity, was completed. Though the great Sir Francis Drake was the first to supply Plymouth with water from Dartmoor, he was not the first to appreciate the enormous possibilities in this direction of this vast acreage of hills and valleys and tors, and what he did was to continue as far as Plymouth a leat which had existed for years before his time. In the matter of quality, no less than in quantity, Dartmoor is remarkable for its water-yielding properties, the degree of hardness being only one and a-half. Long ago the town of Plymouth secured rights over a gathering ground of some seven miles in area, and just in a part most prolific in water. At one time the leats which conveyed the water to Plymouth—a distance of about twelve miles—were open, but they are now all piped. The completion has now attained, at the cost of something like £200,000, of reserve storage works which will enable the authorities to impound for the use of the people of the town and neighbourhood

650,000,000 GALLONS OF WATER.

The undertaking has involved the damming up of the neck of a valley three miles long and half as wide, situated at a spot called Barrator. The dam intercepts a well-known moorland river. It is a huge structure built of local limestone, and the surplus water will pass over the top of it. A second dam was found necessary at a spot at the side of the valley where the ground was porous, and this is carried many feet underground to the bed of the rock. The leat, which will in future supply 6,000,000 gallons of water a day to Plymouth, runs from the bed of the lake that commenced to fill last week.

THE Local Government Board has on sanitary grounds refused to sanction the Croydon County Council's scheme for new waterworks at Whaddon.

THE Maidstone Town Council has decided to promote a Bill in the next Session of Parliament for the compulsory acquisition of the Waterworks Company and the extension of the present sources of supply. The undertaking will cost the town, it is stated, about £120,000.

THE Glasgow and South-Western Railway Company are prepared to expend, during the coming half-year, some £300,000 on the extension of St. Enoch Station at Glasgow, and the widening of their line from St. Enoch Station to Port Eglinton Street Junction.

THE Urban District Council of Newmarket has adopted a scheme by Messrs. Beasley and Sons, of Westminster, for providing a main sewer for Newmarket and Exning, the sewerage to be disposed of by bacterial treatment. Application is to be made to the Local Government Board for sanction for a loan to carry out the works.

A MOVEMENT has been set on foot, and is being influentially supported, for promoting a Bill in the next session of Parliament under the Light Railways Act for the construction of a line from Leighton Buzzard to connect the London and North-Western Railway at that place with the Midland at Harlington and the Great Northern at Hitchin, with several intervening stations. The whole length of the proposed line is 18½ miles. The necessary surveys have been taken.

EAST LONDON WATER SUPPLY.

THE work of connecting the Southwark and East London systems by the Thames subway has been completed, and the reserve water store in the suffering East End has been considerably augmented thereby. Mains on both sides were charged up to the commencement of the subway, and during the day water was passed from one to the other. The critical operation, says the special correspondent of the Times, was the filling of the connecting main in the subway. It had to be carried out by degrees, but just before three o'clock the Southwark water gushed out on the northern side in a full stream from the "by-pass" or small pipe screwed into the upper surface of the big main, showing that the latter was full. I went down into the subway a little later, continues the correspondent, when a full stream was passing under pressure, and learnt that all the

JOINTS WERE STANDING FIRM.

The possibility of an accident on such occasions can never be eliminated until the actual trial is made, but happily everything went well, and the new supply now is pouring into the East London system. A good deal will depend on the effect which the withdrawal of so large a volume of water has in lowering the pressure on the Southwark side. With luck, however, an extension of the supply to six hours a day ought to be feasible before long. The work was begun on September 1st, and has therefore taken less than eighteen days. Credit for its completion in several days less than the most sanguine estimates must be given not only to the engineers and the contractors—Messrs. John Aird and Son—but also to the firms which supplied the special materials required at the shortest notice, and to various companies affected, whose hearty co-operation has greatly facilitated the proceedings: lastly, but most honourably, to the men who have toiled day and night in the tunnel throughout the hot weather. On Saturday one of them fainted from the excessive heat.

THE CISTERN QUESTION.

What has been said on the cistern question has aroused some comment. "An Architect" writes that "it is not true, to begin with, that all the discomfort would vanish if the houses had cisterns. Your own report shows that the water, under present conditions, cannot be relied on to reach a tap only 10ft. from the ground, and one 24ft. high is almost dry. A cistern to be of any use must be above the taps, and in two-storied or higher dwellings will be placed at the top. The Company is bound to supply water up to 40ft., but cisterns will not help it if the water never reaches them. It is quite true that most well-to-do houses have cisterns, but their owners, if they are wise, do not drink from them, but from the main, and they usually have the cisterns cleaned at intervals. The danger of pollution to a cistern is real enough; one of our most eminent sanitarians has found a dead rat in one in his own house, and within a small circle I have had two similar cases. In small tenements it is no one's duty to keep the cisterns clean, while they are generally exposed to

WILFUL FOULING,

and bathing in them, if accessible, has often occurred. For these reasons all towns and country districts having a constant service prefer, for such dwellings, the safety and simplicity of direct connection to the mains, and it is very rare, except in East London, that the system fails. The evil there is that a constant service has been promised, fittings have been made to suit it, rates are paid for it, but it is not supplied. In blocks of workmen's dwellings controlled by the various associations and companies it is not unusual to find cisterns supplying the closets and water laid on to the sinks from the main. This is an ideal system, but it involves control of the cisterns, and it fails where, as pointed out above, no water is delivered to them. In conclusion, no whitewashing can get over the sad fact that the Company, and the Company alone, are to blame for whatever inconvenience exists from the shortness of water in the East End."

Surveying and Sanitary Notes.

A SCHEME has been under consideration by the leading inhabitants of South Bedfordshire for the construction of a new railway in the southern portion of that county for the purpose of opening up the principal market towns. The London and North-Western Railway, the Midland Railway, and the Great Northern Railway have been approached, and there appears to be every probability of something definite being done. As the matter stands at present it is proposed to start a line from a station in the centre of Leighton Buzzard, run it to Hockliffe, and thence to Paddington and Harlington, where a junction with the Midland main line will be formed. From there the line will be carried through Barton, Pirton, and Shillington to Hitchin, where it will terminate at the Great Northern station. Steps have already been taken to promote a Bill in Parliament.

THE reclamation of land from the sea has always been more or less an enterprise of a difficult character, but one which has frequently proved successful. As far back as 1678 the expanse of Brading Harbour was first reclaimed, but the sea twice made inroads through the banks. Later an attempt was made by Sir Hugh Middleton, but again the force of water proved too much for the barrier which was built to check it. About twenty years ago Jabez Balfour secured the estate and built a strong sea wall, formed a harbour, constructed a railway, built gas and water works, and erected a fine hotel on the sea front. Since that time about 520 acres of land have been gradually brought under a state of cultivation, and it was this land, together with a building estate of some twenty-eight acres, that was sold by auction by Messrs. Douglas Young and Co. last week. The whole of the lots offered were disposed of, the total sale amounting to £13,890.

THE prizes gained in connection with a competition and exhibition of plumbers' work held in the Manchester City Art Gallery last April were distributed on Monday week. The competition was promoted by the Council for Manchester and district of the Association for the National Registration of Plumbers. Dr. M. Howe (London) delivered an address on the registration of plumbers and domestic sanitation. He said it was upon the efficiency of a system ensuring the qualification of plumbers and enabling the public to recognise the qualified man that sanitary plumbing materially depended. He urged that registration should be provided for by Act of Parliament. If the Plumbers' Registration Bill became law it would be easier than it now was to maintain the good work carried on by the Association. The trade no less than the public desired it. Public health largely depended upon the quality of the plumber's work. The time had come when the trade should be subjected by Parliament to the control of a national council.

MR. LEES KNOWLES, M.P. (who has charge of the Registration of Plumbers' Bill in the House of Commons), said that all parties in the House were committed to the principle of the Bill, the main object of which was to afford additional safeguards to the public health by enabling persons employing plumbers to select, if they so desired, men who had given some evidence of qualification. When it was shown that the creation of a monopoly was not intended, opposition to the Bill was withdrawn. The object was worthy of the support of any Government, and he hoped strong representations would be made by supporters of the measure throughout the country, which would ensure the early passing of the Bill.

Builders' Notes.

THE Admiralty intend keeping the tenders open of the contract for Gibraltar being converted into an up-to-date naval arsenal until the beginning of next month. Three millions of money is to be expended on the new works. Amongst the contractors who are likely to put in contracts for the work are Sir John Jackson, Topham and Co., Sir W. Pearson, Price and Wills, Morrison and Mason, and others.

SOME alarm was caused in Westminster the other day by the discovery of a further settlement in the great building in Orchard Street abutting on Victoria Street, the collapse of a portion of which some few months ago involved the loss of eight lives. An examination of the structure having shown that danger was to be apprehended, the police stopped all traffic through Victoria Street, diverting the constant stream of buses, cabs, and other vehicles going to Victoria Station at the Royal Aquarium. Not even pedestrians were allowed to pass the dangerous structure, but had to make their way along side streets. From the distance at which were gathered the little groups of curious bystanders who lingered about till midnight, nothing unusual was to be seen, except that the front of the block had been secured by heavy tie-beams.

AT the South-Western Police Court a few days ago, Mr. John Brett, A.R.A., residing at Daisyfield, West Hill, Wandsworth, appeared to answer a complaint of the Wandsworth District Board of Works, who sought to obtain the payment of £145 17s. 11d., being a share of expenses for paving Putney Heath Lane.—Mr. Michael Brett, barrister, and a son of the defendant, appeared for the defence, and raised the point that the lane was not a "new street" within the meaning of the Act. He cited cases showing that the judges had held that, in deciding whether a certain thoroughfare were a new street or not, attention should be paid to the general character of the houses in the neighbourhood.—Mr. Rose concurred.—Mr. W. W. Young, who supported the summons, urged that it was a most serious matter for the Board. If the contention of counsel were accepted it would amount to this, that a road lined with small houses could be called a street, while a road sparsely lined with large houses, of rentals of over £100 a year, could not be called a street. Surely his Worship would not say the Board would have to wait till the gaps between the large houses were filled before calling on the owners to pay for the paving?—The summons was dismissed.

A CORRESPONDENT writes to the Daily News from Interlaken: The first section of the Jungfrau Railway is now open, and nearly 500 passengers made the journey up the mountains to the Eiger Glacier on the first day. In the Jungfrau Railway, which starts from Scheidegg, already at an altitude of more than 6000ft. above the level of the sea, the use of steam as an auxiliary is dispensed with in favour of electricity, the motive power being derived from the Lutschina, near Lauterbrunnen. In the project which Mr. Guyer Zeller is pushing on very energetically, the line on leaving the Scheidegg runs on the western slope of the Bodenhübel Fall, making straight for the foot of the Eiger Glacier. Thence the direction determined upon is due east; later it will turn south in a tunnel winding round the solid body of the Eiger as far as the station, nearly ten thousand feet above the sea. The tunnel will then continue in a straight line towards the Mönch and the Jungfrau-Joch, and will finally curve round the uppermost solid block of the mountain, and will complete the journey on a plateau well known to the guides. At this point an altitude between 13,000ft. and 14,000ft. will have been reached, and a huge lift "will carry the passengers" to the snow-capped summit of the mountain. Mr. Guyer Zeller expects that it will be three or four years yet before the work, for which plans and material are well prepared, is finished.

PARIS ABATTOIRS.*

BY R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page xx.)

IN Fig. 23 a view is shown of one of the killing courts, with echaudoirs on either side. These echaudoirs are fitted up with a number of iron brackets fixed to the walls, each capable of supporting three sheep, and in the centre are iron joists with wooden cross beams for beasts. In addition to this many of the echaudoirs have movable wooden stands for sheep, as shown on Fig. 22.

The upper story over the echaudoirs is used for stores and tools, access being obtained by the staircases in the centre of each block; w.c.'s and urinals for the employés are arranged at the corners of the buildings.

These buildings are erected in brick and stone with red tiled roofs and greatly projecting eaves (Fig. 20).

The killing court is covered by an iron and glass roof similar to that over the court between the bouvieries and bergeries, and is paved in granite blocks. The floors of echaudoirs are in cement on concrete.

At G G (Fig. 1) are the large "porcheries," or stables for pigs. These buildings are two stories in height, the ground floor being used as lairs and the lofts for storage and litter.

FIG. 23.

gressoires," or rooms for the preparation of the intestines, and these rooms are fitted with an

a central courtyard, and it is here that the work in connection with the preparation of blood is carried on.

During the process of slaughtering, the blood is all collected in circular bins, and is then placed in circular tin troughs, with perforations in the bottom, allowing the albumen to pass into a lower dish of similar size. The residue becomes a fairly solid mass, which is placed in large iron tins, treated chemically, and finally used as manure.

Adjoining the above is a rectangular building (K K Fig. 1), in which the skins receive the first treatment previous to being tanned and converted into leather.

At M M are cloak rooms and conveniences for the women employed in the abattoirs.

The clock tower N N (Fig. 27) is placed centrally with the entrance gates to the Route de Flandres. At the base of this tower particulars of the number of animals "declared" each market day are posted.

This tower, which is executed in brick and stone, is very pleasing in design.

To the north of the clock tower is the "Vente à la Criée" (O O), which is seen beyond the clock tower in Fig. 27. This consists of an octagonal building, with four wings, and it is here that dead meat is sold by auction. It is a comparatively small building but of sufficient size, as nearly the whole of the meat is carted away direct from the Echaudoirs.

On the opposite side is a building somewhat similar in plan, used as police offices, ambu-

FIG. 26.

They are built in brick and stone with red tiled roofs. A large open court divides the two blocks.

The "Bruloir," or killing and burning house for pigs is at H H (Fig. 1), and is placed at the end of the porcheries (see Fig. 24). The building has thirteen sides and is divided internally into six chambers separated from each other by dwarf brick walls. The materials employed are brick, with stone dressings and tiled roofs.

The animals are brought from the porcheries, and about six or eight of them are placed in one division. They are then stunned by a heavy wooden hammer, killed, and the bodies placed side by side. Straw is covered over them and ignited in order to burn off the hair from the carcasses. The smoke occasioned by this work ascends and escapes through the louvred ventilators at the apex of the roof.

The carcasses are then taken to the "pén-doirs," Figs. 25 and 26, when they are disembowelled, scraped, and prepared. This is a very fine hall covered by an iron roof. As shown in the illustration, dwarf iron columns support iron beams, fitted with hooks, from which the bodies are suspended.

On either side of this hall are the "de-

ample supply of troughs and sinks for cleaning purposes.

At J J are buildings occupying three sides of

FIG. 24.

* This series deals with the construction of the Cattle Markets and Abattoirs of La Villette and La-Rive Gauche, Paris.

Fig. 25.

lance station, veterinary inspector's office, and "Syndicat du Commerce."

To the right and left on entering the gates are two-storied buildings (Q Q and R R, Fig. 1) devoted to apartments for the concierge, octroi, recette, administration, declaration and chef de service and employés. At the entrances four weighing tables are also provided for weighing the carcasses as they leave the abattoirs.

Adjoining the boundary railings at the corner of the Rue Militaire, and also at the opposite side, are small wooden buildings used as merchants' offices, club for the butchers, labour bureau, &c. (S S and X X).

The small pavilions T T, U U, Y Y, and W W adjoining the entrance gates are offices of the octroi, Y Y for gas meters, and Z Z is a tool shed.

Adjoining the above is a small stone building of one story which is used as a police station, and also by the firemen and Republican Guard (A A A).

The long one-storied building abutting on the Quai de la Charente (B B B) is used as private bergeries, and at the end is a small shed (C C C) for sharpening knives, &c.

As will be seen in many of the illustrations, trees are planted on either side of most of the main avenues, which add a decidedly pleasing appearance to the group of buildings.

The concluding articles will deal with the

New Abattoirs of La Rive Gauche, in which many great improvements are manifest.
(To be continued.)

Fig. 27.

Trade and Craft.

MESSRS. ASPINALL, LIMITED.

Messrs. Aspinall, Limited, manufacturers of the celebrated enamel, last week circularised their customers, informing them that a slight delay in the execution of orders will necessarily occur owing to their extensive premises at North Road, New Cross Road, S.E., having been destroyed by fire. The building, which was four stories in height, and was used as a manufactory and store, was completely gutted.

THE CLYDE STRUCTURAL IRON COMPANY.

The Clyde Structural Iron Company have opened their new works at Scotstoun for the construction and erection of sheds, roofs, bridges, and structural work of all kinds. They have just secured the contract for the erection of the spacious workshops in connection with the tube works which are to be opened at Whifflet, Coatbridge, by the Clyde-side Tube Company.

A MEMORIAL WINDOW.

A memorial five-light window to the late Mrs. H. S. Richards has just been placed in the chancel of the Asbury Memorial Church, Handsworth, near Birmingham, together with two smaller side windows. The subjects are the Transfiguration and the True Vine and Good Shepherd. The windows were designed by Mr. T. W. Camm, of Smethwick, and executed at his studio.

Property and Land Sales.

HAMPTON AND SONS, ESTATE AGENTS, AUCTIONEERS, AND VALUERS.

1898.

HAMPTON AND SONS beg to announce that their AUCTIONS of LANDED ESTATES, Town and Country RESIDENCES, INVESTMENTS, BUSINESS PREMISES, and other PROPERTIES are held MONTHLY at the Mart, Tokenhouse-yard, E.C. Auctions can also be held on other days in Town or Country by arrangement; also Sales and Valuations of Furniture, Pictures, Farming Stock, Timber, &c. List of Estates, Town and Country Residences, Hunting Boxes, and Sporting Properties can be had gratis on application to HAMPTON AND SONS (Ltd.), 1, Jockspur street, S.W.; or by post, three stamps. Auction and Estate Offices, 1, Cockspur-street, Pall-mall, S.W.

HAREFIELD GROVE ESTATE, near Rickmansworth. MIDDLESEX and WEST HERTS. 7 miles from London and two miles from two railway stations.

To be Sold by Auction, on Tuesday, October 18th, 1898, by **MESSRS. MILLAR, SON, and Co.**, are instructed to SELL this beautiful FREEHOLD RESIDENTIAL, Sporting, and Agricultural ESTATE, in one or more lots, as under:—

Lot 1.—The unique Residential Estate, Harefield Grove, comprising a well-built, comfortable mansion, approached by a carriage drive, with lodge, occupying a fine position amidst most perfect surroundings of undulating lawns, luxurious shrubberies, lakes, ponds of aquatic plants, tennis lawns and courts, and containing five handsome reception rooms, conservatory, about 20 bedrooms, complete domestic offices; modern stabling, with clock tower, kitchen gardens, vineries, and other glasshouses; electric light plant; gardener's cottage, orchards, farm buildings, &c., the whole comprising 146a. 1r. 10p. of finely-timbered park, rich meadow, and woodlands.

Lot 2.—A beautiful Small Freehold Estate, containing nearly 20 acres of well-timbered park land, and having extensive frontages to main roads, and commanding over views; picturesque lodge, with carriage drive, and gates—a unique position for a good residence.

Lot 3.—A Building Estate of 7 acres, with a frontage of 485ft. to main road.

Lot 4.—A Building Estate of 7 acres, frontage of 520ft.

Lot 5.—A Building Estate of nearly 4 acres, frontage of 420ft.

Lot 6.—A Building Estate of 18½ acres, with extensive frontages to two roads, extending to 2100ft.

Lot 7.—A Building Estate of 11½ acres, with a frontage of 555ft.

Lot 8.—A similar Estate of 11½ acres, with a frontage of 680ft.

Lot 9.—Valuable Building Estate, comprising 21 acres, commanding nice views, with orchard and cottages, frontage of 1100ft.

All these Building Estates have excellent sites for large or small residences (for which there is great demand).

Particulars, plans, and conditions of sale at the Mart; of Messrs. F. and Co., Solicitors, 6, Dowgate-hill, E.C.; and at the Auctioneers' Offices, 14, Grafton-street, Bond-street, London, W.

FOR SALE.

FREEHOLD.—SANDFORD HOUSE and ESTATE, Godshill, I.W.

Six rail stations within one to four miles. Lush beauty, splendid views and soil, mild climate, majestic, rare evergreen trees, &c.

Whether as one property, or in portions to suit buyers, viz.: 1. The HOUSE, with a beautiful cottage and any portion of gardens and grounds.

2. The FARM, with 6½ acres good land, part adapted for building development.

3. The BUILDING LAND, skirting the High-road to Godshill.

4. The SEVEN perfect STONE COTTAGES.

5. The 12 ACRES of MARKET GARDENS, and several old and new orchards, &c.

6. The EIGHT GLASS FORCING HOUSES, splendid vineries, peach, tomato, cucumber, melon, and fig houses, &c.

7. The important matured NURSERIES, several acres of rare trees, shrubs, evergreens, &c.

(Nos. 5, 6, and 7 are all going concerns.)

Part of the purchase money may remain on mortgage, or particulars, &c., apply to Messrs. DOWSETT, MIGHT, and Co., 3, Lincoln's-inn-fields, London, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above exams. by correspondence; no books are required.—or particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION.—personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural reading Library. Special three months' finishing courses.—For full particulars apply to Mr. W. HURCH HOGWATE, A.R.I.B.A., Perchard House, 1, Gower-street, W.C. (close to the British Museum).

HONOURS BUILDING CONSTRUCTION and **HONOURS CARPENTRY.**—Special classes for the above will be taught by Mr. H. BUSBRIDGE, E.C.S., Mem. San. Inst., at Westbourne Park Institute, Bayswater, and at Goldsmiths' Institute, New Ross, commencing last week in SEPTEMBER. Also separate Elementary and Advanced Classes at low fees. For further particulars apply to the SECRETARIES, or 43, Heavitree-road, Plumstead, S.E.

R.I.B.A., SOCIETY of ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

ARCHITECT, SURVEYOR, and VALUER.—For SALE, on account of death, first-class PRACTICE; a splendid opening for an experienced man with capital.—Apply, PARSONS, 9, Grimshawe-street, Burnley.

CITY of LIVERPOOL. SCHOOL of ARCHITECTURE AND APPLIED ART.

UNIVERSITY COLLEGE.
Fifth Session, 1898-9, commences MONDAY, October 3rd.

In Architecture, a TWO YEARS' COURSE of Preliminary Training is provided for Students to pass through before entering an Architect's Office. Classes are also held in the Day and Evening for Pupils and Assistants already in offices.

Classes are held in Modelling and Design, Ornament and the Figure suitable for Sculptors, Modellers, Carvers, Plasterers, &c.; in Drawing, Painting, and Decorative Design, the last being divided into two classes, specially arranged for Students who wish to take up Decorative Work; in Wood Carving and Wrought Iron, especially in their relationship to Architecture; in Brass and Copper Work, in Stained Glass, in Furniture and Fittings' Construction, and in Furniture and Fittings' Design.

Six Free Studentships are offered to the Day Classes. Eighteen Free Studentships are offered to the Evening Classes, two to each of the above-mentioned Classes.

Prizes are awarded at the end of the Session to the most successful Students.

For details of Classes, Free Studentships, Prizes, and all further particulars, apply to the Director, Professor SIMPSON, University College.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, in the Municipal Engineer's Office of a large Midland town, a DISTRICT FOREMAN of HIGHWAYS, 45s. per week; DISTRICT BUILDING INSPECTOR, 45s. per week; ARCHITECTURAL ASSISTANT, 50s. per week.—Apply, stating age, experience, &c., to Box 837, BUILDERS' JOURNAL Office.

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office. Gentlewomen only.—Box 837, BUILDERS' JOURNAL Office.

CLERK of WORKS.—WANTED, a thoroughly specially experienced Clerk of Works, in connection with the work to be done in the redrainage and new sanitary fittings to the Holborn Union, Archway-road Infirmary, N. Salary four guineas per week.—Apply by letter only, stating qualifications, and enclosing copies of three recent testimonials, to Mr. H. WILLIAMS MELLOR, Quantity Surveyor, 17, Buckingham-street, Adelphi, W.C.

WANTED, ARCHITECTURAL ASSISTANT. Thoroughly conversant with design, specifications, estimating, surveying and levelling, together with some knowledge of modern steel construction. State age, experience, and salary required, to SUPERINTENDING ENGINEER, H.M. Dockyard, Devonport.

ASSISTANT (young) REQUIRED in City Architect's office. Must be smart tracer and colourist. State age and salary.—JUNIOR, care of W. Everett and Son, 17, Royal Exchange, E.C.

ARCHITECT'S ASSISTANT (duly qualified) WANTED at once. Must be a neat and artistic draughtsman, and well up in construction.—Apply by letter, stating age and qualifications, and salary required, to ARCHITECT, care of J. W. Waddington, Stationer, Silver-street, Hull.

BUILDER'S ASSISTANT WANTED at once in a Jobbing Business. Must be practical and experienced. Well up in setting-out, measuring-up, and superintending work. Have good command of men.—State age, references, and salary required, to W. BARNETT, Builder and Decorator, 65 and 67, Myddleton-road, Bowes Park, N.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. G. SCOREE, 28, Newman-street, W.

HOSPITALS and INFIRMARIES.—Expert confidential ASSISTANCE. Formerly draughtsman for Local Government Board; highly successful in competitions, for which moderate speculative terms are offered.—"G. B.," Caen Cottage, Hyde, I.W.

YOUNG Gentleman REQUIRES SITUATION as SURVEYOR'S ASSISTANT; seven years' experience in building trade; well up in quantities, details, and all office work; good references.—Apply, Box Office 823, BUILDERS' JOURNAL.

ARCHITECT'S ASSISTANT and CLERK of WORKS desires ENGAGEMENT. Ten years' London experience. Draughtsman, quantities, specification, surveying, and constructional ironwork.—"G.," 47, Cotleigh-road, Kilburn.

TO SURVEYORS.—Assistance given in spare time by Builder's Clerk, working up, &c. Also working and detail drawings prepared.—Apply Box 833, BUILDERS' JOURNAL Office.

ARCHITECT'S JUNIOR ASSISTANT requires ENGAGEMENT. Just terminated three years' articles. Good draughtsman, tracer, and colourist. Good reference. Aged 22.—A. MIDWINTER, St. Paul's Vicarage, Lisson-grove, N.W.

ARCHITECTS ASSISTANT, terminating engagement with well-known Architect, desires RE-ENGAGEMENT. Six years' experience in London offices. Working and detail drawings. Assist at quantities.—SURRELL, 56, Gap-road, Wimbledon.

AN ARCHITECT of twenty-five years' experience desires a RE-ENGAGEMENT as MANAGER or SENIOR DRAUGHTSMAN. London only. Accustomed to church, school, villa, public buildings, and public-house work. Salary 3 guineas. Good references.—"P.," 6, Kelvin-road, Highbury Park, N.

ARCHITECT'S ASSISTANT (23) requires ENGAGEMENT. Good draughtsman. Eight years' experience. Would like better knowledge of quantities. Will submit drawings. Smart colourist. Salary 30s. Good references.—"W.," 133, Manchester-road, Burnley.

ARCHITECT'S ASSISTANT. Thoroughly up in all building construction, especially steel and ironwork warehouses, factories, and business premises. Sixteen years' experience.—"F. M. C.," 1, Gladys-road, West Hampstead, N.W.

ARCHITECT'S JUNIOR ASSISTANT requires RE-ENGAGEMENT. Salary, 22s.—Address, G. B., 9, Ely-place, Holborn, E.C.

An Architectural Causerie.

WE must confess, to begin with, that the sound of the "model village" is an alluring one. You picture, in the model village of romance, the aged villagers seated round some ancient tree in the midst of a verdant village green, and gossiping, while the younger generation disports itself in rustic games, and while thirsty souls sit on benches outside a picturesque village ale-house in the background and carouse. You picture all these things in your mind's eye because this is the sort of scene which the scene-painter and the stage-manager arrange for the stage in romantic drama. It is a pleasing picture, and you readily conceive that the "model village" on some reforming nobleman's estate, of which you read in the papers, is on these lines. It was, for instance, but the other day that we read an account of the so-called "model village" of Canford Magna, near Wimborne, the creation of the present Lord Wimborne; and so laudatory of the place was that account that, when in that district, we made a point of seeing it. The disappointment was great. Trim lawns and well-kept flower-beds were much in evidence, it is true, at the sides of the roadway; and the cottage gardens were gorgeous with a late summer display of sun-flowers and asters. Some of the cottages, too, were actually thatched. But the majority of the dwellings here were built in a peculiarly hideous kind of brick, which was neither white, brown, grey, nor yellow, but a pallid combination of all four; a complexion suggesting a tardy recovery from a severe illness. Also all the cottages bore an unmistakable likeness to one another and were numbered as scrupulously as a London street. The village ale-house was missing, and a temperance tavern was in its place, which may or may not be an admirable innovation—just as your prejudices suggest. Village green there was not, but there was over all the place that sense of proprietorship which probably no self-respecting villager could live under for long, and yet keep his self-respect, even though his weekly rent be insignificant. When the present Royal Exchange was built and the inscription cut on its forefront, "The earth is the Lord's and the fulness thereof," the Radicals humourously shifted the apostrophe in the political skits of that time, rendering the meaning to be that the earth and its products were the property of the House of Peers; and it is just this assumption of omnipotence which is conveyed at the village of Canford Magna by Lord Wimborne's "model" settlement. The moral of it all is that you can no more make a beautiful and picturesque village to order than you can rear handsome and model inhabitants to people it. The ultimate test of that much misunderstood quality—picturesqueness—lies with the artist. Would he select such places as subjects for pictures? The answer must sorrowfully be made that he would not. The model village is no new thing, although examples are now becoming more frequent. As far back as 1786 the village of Milton Abbas, in Dorsetshire, was built by Joseph Damer, first Earl of Dorchester. He demolished the old cottages

and rebuilt the whole of the village street. That street has one of the loveliest woodland views in this country. The road goes sloping down steeply towards the heavily wooded expanse of Milton Park, with swelling uplands on either side, and beneath them those eighteenth-century ideal cottages, each one with a steep thatched roof exactly similar to its neighbour, and with a most depressing regularity of plan and elevation. This was the ideal of a century ago; to-day it seems but a blot upon the landscape, singular, and in some respects interesting, but not beautiful by any means. Will future generations be able to say anything better for the model villages built in our own times?

C. G. H.

labours is a wealth of information on everything connected with the construction of the stage, which cannot but be highly appreciated by all those interested in the matter. The book is divided into three sections, dealing with wood stages, wood and iron stages, and iron stages respectively, in which the methods of each are explained, and the various advantages and disadvantages are discussed. The author, however, does not formulate any model stage of his own; he presents examples and different types, and prefers that his work should be considered as a study, which he hopes will be of practical value to all those in any way concerned with stage construction or management. There is no doubt that such will be the case.

Stage Construction.*

CONSIDERING the recent activity in theatre building, both in the suburbs and in the provinces, one can quite understand the demand for reliable information as to the latest and most approved principles of stage construction which has prompted Mr. Sachs to take the unusual course of issuing this supplement to "Modern Opera Houses and Theatres" before the appearance of the third volume. Mr. Sachs has had the privilege of visiting most of the principal playhouses of Europe, and had opportunities afforded him for thoroughly studying his subject—even to the account books—for details of cost of maintenance. He has discussed his subject both with those who design, and those who manage the respective stages, and is able to give the opinions of many leading authorities in all countries. The outcome of his

Incidentally, we are able to see now backward we are in this country compared with the Continent, and how much room there is for the application of modern scientific methods and appliances to our stage construction. The volume is profusely illustrated by six plates and 170 illustrations in the text, giving plans, sections, photographic views, and elaborate details of most of the examples discussed. It is a pleasure to be able to congratulate Mr. Sachs on the appearance of this addition to our technical knowledge, and we are impressed by his energy and enthusiasm. The book deserves every success, and we hope it will obtain it. There can be but few men who have had Mr. Sachs' opportunities for comparison or for the acquisition of knowledge of this subject. When he has had more time to think it over, and thoroughly digest his information, perhaps he may be tempted to give us his view of the ideal stage, which could not fail to be interesting and instructive.

A. R. J.

* "Stage Construction." A Supplement to "Modern Opera Houses and Theatres." By Edwin O. Sachs.

OLD ENGLISH FURNITURE.

ALTHOUGH the taste for Chippendale and old English carved furniture generally is of by no means recent date, the season of ales just closed must always rank very high, says *The Times*, so far as regards prices. It is a surprisingly curious fact that very few Chippendale articles have occurred in the great collections of antique furniture which have come under the hammer during the past half a century—the Hamilton Palace sale only included a mahogany table which fetched 58 guineas—so that the collector's main chance of meeting with first-rate articles of this description is very largely confined to miscellaneous sales both in town and country. During the last few years the demand for the genuine work of the earlier English designers has enormously increased, and prices have gone up in a proportionate ratio till they have long since passed beyond the reach of the man of small means. During the summer months the London dealers, directly or indirectly, scour the entire country, paying ready money for anything at all likely to bring them in a profit. Some wonderful stories are told of the discoveries which have in this way been made. The vendor, who is more often than not ignorant of the real commercial value of his property, does not often have the best of the bargain. During the season the dealers' agents are everywhere, and practically no sale advertised in London is left unscanned. It was at one of these country sales that the record prices for

CHIPPENDALE CHAIRS

were obtained. This sale, it is true, was conducted by a London firm of auctioneers (Robinson and Fisher), and it was held in July last at Bradfield Hall, near Reading, the property of the Connop family. There were two remarkably fine old Chippendale elbow state chairs, with openwork backs, with exquisitely carved bold lion's head handles to the elbows, the cabriole legs with lion's head masks, and covered in fine old English silk needlework. These two chairs were bought for 780 guineas by a dealer, who is said to have sold them shortly afterwards for 1000 guineas—a very good day's work indeed. The same sale included a large Chippendale state easy chair of fine design and cleverly carved, having the arms of the Barrington family, the seat, back, and elbows covered in beautiful old tapestry; this realised 205 guineas, and a similar chair, but gilt, upholstered in red velvet, went for 105 guineas. A set of six Chippendale chairs, with mahogany frames, and with very finely carved openwork backs in scrolls and leaves, realised 93 guineas, or at the rate of 15½ guineas per chair. Earlier in the season the same firm sold at their London house another set of six carved mahogany Chippendale chairs, with finely decorated and pierced backs of beautiful design, on carved cabriole legs, for £108, or at the rate of £18 per chair; this set is said to have cost the late owner about £6. Some very interesting and genuine old Chippendale furniture occurred in the sale of the contents of Longstowe Hall, Cambridge (Grain, Moyes, and Wisbey, of Cambridge), several arm chairs realising, even at so remote a place, from £10 to ten guineas a-piece, and a mahogany bookcase, 5ft. 9in., with projecting centre, brought £30. At the Egmont sale in London of the furniture removed from the mansion-house of Cowdray, Midhurst, Sussex (Messrs. Trollope), one set of three Chippendale chairs, covered with damask, sold for 23 guineas, and another set of six chairs, the seats covered with figured leather, and two elbow-chairs *en suite* together showed a total of just over £53. Two unusually

FINE CHIPPENDALE MAHOGANY CABINETS, with carved borders and legs and open gallery above, each with three glazed doors 7ft. high and 4ft. wide, at Christie's on May 20th, together brought 230 guineas; at the same time a dozen very ordinary Chippendale chairs brought 63 guineas. On June 3rd, at the

same place, a pair of Chippendale torchères of mahogany and satinwood, formed as tripod altars, carved with festoons and drapery, acanthus foliage, &c., 55in. high, brought 44 guineas. Finally, the sale in August of the late Mr. John Hargreaves, of Maiden Erlegh, near Reading (held by Walton and Lee, of London), comprised a number of choice Chippendale articles—a 6ft. beautifully carved mahogany table with marble top (the latter faulty) brought the excellent price of £28; a mahogany cabinet, glazed front and sides, with a quaintly-designed open top for china, 4ft. wide, brought £124; one of the cheapest bargains of the year was obtained at this sale when a beautifully-carved Chippendale suite from the ball-room, upholstered in Persian pattern tapestry, comprising six chairs, a pair of elbow chairs, and a 5½ft. settee, was knocked down for £50. At this sale also four ordinary carved mahogany chairs brought £7 each. Of course, it is almost unnecessary to say that all, or nearly all, these articles were bought by dealers as a speculation, and that the prices here quoted are much below those at which they will be acquired by private purchasers. There is never any difficulty experienced in disposing of first-rate articles of decorative or antique furniture. Next to Chippendale, the Sheraton style of English furniture is most in demand with collectors and connoisseurs. It is not necessary in this place to discuss the relative merits of the two styles, but owing to the more widespread popularity of Chippendale the prices are considerably higher than those realised by Sheraton articles. Nevertheless, some good prices have been realised during the past season for Sheraton furniture—prices which at one time would have been regarded as impossible ones. On June 3rd a writing-table, 33in. wide, inlaid with vases of flowers, rosettes, flutings, and a figure emblematic of Faith, in coloured woods, was sold at Christie's for 70 guineas; on April 1st, at the same place, a small Sheraton upright secretary of inlaid mahogany and satinwood, 25in. wide, inlaid with arabesques of baskets of fruits in coloured woods, brought £14 10s.; on January 28th, also at Christie's, a circular table of inlaid mahogany and satinwood, 42in. in diameter, on pillar and claw-feet, realised 20 guineas. Although they have very

LITTLE TO DO WITH SHERATON,

we may include here two other articles of furniture, namely, an Adams upright secretary of mahogany and satinwood inlaid with vases, rams' heads, and laurel festoons, with tall cabinet above, 105in. high and 53in. wide, which brought £30 at Christie's on April 1st; and a Carlton House writing table of satinwood with inlaid rosewood borders, painted with festoons and wreaths of flowers and foliage, &c., 48in. wide, which at the same place on May 17th realised 66 guineas. There are many articles of English furniture, dating long before the times of either Chippendale or Sheraton, which brought noteworthy prices during the past season. We can only refer to a few of the more striking articles. At the Longstowe Hall sale, a very fine Elizabethan cabinet, 5½ft., with sunk inlaid panels with scenes, and profusely inlaid pilasters, the bottom with richly and boldly carved trussel supports, brought £40; at the same sale a very fine old English marqueterie cabinet, 3ft. 8in., the interior and exterior profusely

INLaid WITH VASES OF FLOWERS AND BIRDS, the cornice and mouldings with ivory and ebony, sold for £53. A set of six finely carved Elizabethan ebony chairs, with decorations of the highest quality, square backs, and upholstered in crimson Utrecht velvet, brought 126 guineas at the Bradfield Hall sale. At the Addison sale at Christie's, June 24th (the articles were removed from Bilton Hall, Rugby, formerly the residence of the great essayist, and are said to have been removed there from Holland House), there were two articles of old English furniture of note—a walnutwood arm-chair, with arms carved with scroll foliage, and with spirally fluted stretchers for the legs—this brought 21 guineas; and an old English bench, with open back and ends, boldly carved with scroll foliage, coronet, and

shields, 26 guineas. The Egmont sale comprised several interesting articles of carved oak furniture of the Jacobean period—two cabinets, 4ft. 3in. wide, brought 40 guineas and two other tall cabinets, one 4ft. 4in. wide, and one not so wide by 12in., together realised 61 guineas. At Robinson and Fisher's, on February 17th, a pair of old high-back carved Jacobean chairs, on cabriole legs, fetched 22 guineas; the Bradfield Hall sale also included some

ARTICLES OF THE JACOBÆAN PERIOD

in mahogany—e.g., a 7ft. 8in. side table, with finely carved border and decorations, and the companion table realised £90. At Christie's on June 3rd a pair of Charles II. large oak arm-chairs, carved with scroll foliage, the arms carved with lions couchant, brought the very high price of 75 guineas. The Bradfield Hall sale included many very choice articles of the Queen Anne period, notably a set of six Spanish mahogany dining room chairs, with scroll and decorated backs, on massive and finely-carved cabriole legs, brought a total of £180, or £30 per chair, probably a record price for chairs of this period. The same sale included a set of six richly-carved Queen Anne state chairs, the backs with shell and scroll decorations, and two settees *en suite*, the eight articles realising a total of 142 guineas. Compared with the enormous prices paid for articles of decorative French furniture at the Hamilton Palace and other sales, the foregoing amounts will appear indeed insignificant, but compared with the prices paid a few years ago for articles as nearly as possible similar, it will be at once admitted that the past season has been one of the highest importance in the annals of furniture sales. The finer articles of old English workmanship are becoming increasingly difficult to obtain, while the taste for them seems to increase as the supply diminishes.

"SOME LATTER-DAY PROCLIVITIES."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I refer you to the review of my article embodied in the letter published in your current issue. I have an admission to make. No longer will I conceal the fact from my Editor. It is true, as "F. B." has said: I am *not* omniscient. I have been found out at last, and "F. B." is the man who has done it.

It is only to be regretted that he did not understand the article in question, or his revelation would have been more complete. His letter, as you will have noticed, is somewhat of a silliness, but rather well put, though wordy. I did not, of course, use the term "Latter-day" synonymously with "Modern," but obviously gave it a particular meaning indicating typical present-day ideals. For the rest, I only go armed *cap-à-pie* to fight, not to joust or play on the green. On these occasions I flog with my bladderful of peas the donkey whose progress I am interested to hasten, and no other. We can't all play the part of heavy father to the Arts, and always—everywhere. Paradox and hyperbole have a legitimate use and value, although an ear trained to specification clauses may not perceive it.

I hope "F. B." won't understand this letter either. But pray, Sir, don't explain it to him. We must all work out our own salvation. Finally, on a charge of having said something I did not say, "F. B." calls me a "child," Sir, and also states that I am a stranger to my own imperfections. This is personal, and a little rude, and therefore does not call for remark. At the same time, one is always glad to hear any reflections one's readers may have to cast. They help to keep one merry.—I am, yours obediently, B. C.
September 29th, 1898.

A FIRE broke out on Saturday morning at Bisham Abbey, an historic building on the bank of the Thames between Marlow and Henley. The flames originated in the roof, part of which, together with several old oak beams, were destroyed. The damage was not extensive.

AN OLD ALMSHOUSE.

BY CHARLES G. HARPER.

THAT great modern borough of Croydon, which sprawls ungainly over the southern fringe of London, has eaten up with its continual growth many fair nooks and old-world corners. Meadows and woodlands and quaint villages have been swallowed up and incorporated within that town, and the town itself has within the last decade been practically rebuilt. All these changes may be looked upon with mingled feelings of congratulation and regret: congratulation because the squalid slums that festered at the very centre of the borough have been swept away; regrets because much that was picturesque disappeared at the same time. The modern

almshouse. It is this monument of old-time piety and benevolence that is now threatened by local widening schemes, for it is proposed to demolish the buildings and to erect business premises on what remains of the site when the street frontage has been set back. A potent argument in favour of these proposals is that with the sale of this now valuable site the Hospital can be rebuilt on a much larger scale on the outskirts of the town.

A solitude amidst the throng, it now stands in North End, remarkable in the simplicity of its screening walls of dark red brick, elbowed by all the impertinence of modern plate glass. Once within the outer portal of the Hospital, ornamented overhead with the arms of the See of Canterbury impaled with those of Whitgift, and eloquent with the motto "*Qui dat pauperi non indigebit*," we are in another world than the striving business world outside. The building is, as old Aubrey quaintly puts it, "a handsome edifice, erected in the manner of

These are ideal rooms: rooms that delight one with their unspoilt air of the sixteenth century. The sun streams through the western windows over their deep embrasures, lighting up finely the darksome woodwork with patches of brilliance, and brightening every cranny of the cavernous old place, designed as much for strength as for comfort; for the door is of solid-hewn heart of oak, studded with nails and furnished with a hatch for parleying with visitors standing on the stairs without.

Then there is the chapel in a corner of the quadrangle. No pomp of carving or vanity of blazoning ash to be seen here, for the good Archbishop, mindful of economy, would have none of these. The seats and benches are contemporary with the building, and are rough-hewn. On the western wall hangs the portrait of the founder, black-framed and mellowed, rescued from the boys of the Whitgift schools ere quite destroyed; and on the other walls are the portrait of a lady, supposed to repre-

Hospital of the Holy Trinity.
The Dining Hall

THE DINING HALL, WHITGIFT'S HOSPITAL, CROYDON.

Architecture that has replaced the mean buildings of eighty years or so back in the chief business streets of Croydon is some of the finest to be seen in any provincial town, and certain examples might be instanced which would do credit to London itself; while the Municipal Buildings that have replaced that miracle of commonplace design, the old Town Hall, form a monument to the local patriotism of Croydon's burgesses and a model for other places to copy.

But with all this admirable enthusiasm for true improvement, and with the material prosperity which has attended Croydon of late years, has come a passion for widening the principal thoroughfares which, in itself beyond criticism, is about to perpetrate an act of extremely shocking vandalism. Those who know their Croydon well will remember the ancient Hospital of the Holy Trinity, better known as "Whitgift's Hospital," standing with its long frontage to North End, where that thoroughfare and the High Street join. Time was (and that not so long since) when this part of Croydon was singularly old-world in appearance, but now whatever of antiquity and picturesqueness the spot possessed has all gone in the building of shops that would not disgrace Bond Street itself—save only this old

a college, by the Right Reverend Father in God, John Whitgift, late Archbishop of Canterbury." The dainty quadrangle, set about with grass lawns and bright flowers, is formed on three sides by tiny houses of two floors, where dwell the poor brothers and sisters of this old foundation—twenty brothers and sixteen sisters—who, besides lodging, receive each £40 and £30 per annum respectively. The fourth side, the farthest from the street, is occupied by the hall, the warden's rooms, and the chapel, all in very much the same condition as they were at their building. The old oak table in the hall is dated 1614, and much of the stained glass is of sixteenth century date.

But it is in the Warden's rooms above that the eye is feasted with old woodwork, ancient panelling black with the lapse of time, quaint muniment chests, and curious records. These were the rooms especially reserved for his use during his lifetime by the pious founder, Archbishop Whitgift. Here is a case exhibiting the original titles to the lands on which the Hospital is built, and of the others with which it is endowed; formidable sheets of parchments, bearing many seals, and, in one instance, what does duty for a seal—a gold "angel" of the reign of Edward VI.

sent the Archbishop's niece, and a ghastly painting of Death as a skeleton digging a grave. But all these things are seen but dimly, for the light within the chapel is very feeble.

The formal opening of the reading and band room for Blackpool, at 66, York Street, took place a few days ago.

The foundation stones have been laid at New Benwell, Newcastle, of the Bond Memorial Wesleyan chapel, which is being erected at a cost of £4000.

A LARGE block of offices, Nos. 28, 29, and 30, the Minories, has been burnt out. Twenty-nine offices were completely destroyed, and other portions of the block suffered severely.

The Bishop of Truro has opened new church premises at Perranarworthal. The premises consist of a commodious Sunday school and class-rooms, built on a part of the glebe, close to the church.

PRESIDENT M'KINLEY has written a letter approving the proposed erection of a monument to Lafayette in Paris, the cost of which would be defrayed by subscriptions from the students and school children of the United States.

Ancient Irish Ecclesiastical Plate.

THE Rev. J. F. M. Ffrench, whose name is well known in the field of Irish Antiquarian research, has recently communicated an interesting paper to the "Journal of the Royal Society of Antiquaries of Ireland" upon the subject of some Irish Church chalices. "The history, the form, the material, and the workmanship displayed on the vessels used in the services of the Christian Churches, must," Mr. Ffrench observes, "always interest a large number of people, and serve to illustrate the education, the culture, and the

ART-WORKMANSHIP OF THE PERIOD

during which they were constructed." The chalices in use in the primitive Church and in early times in this country, were, we are told, frequently made of rude material and inferior metals. Wood, earthenware, stone, glass, copper, brass, bronze, and pewter were all used in these days, when, we are reminded, the Church in "her infancy, her weakness, her poverty, and her persecution, had to be satisfied with objects made of such poor material, and of such rude art workmanship as the exigencies of her position enabled her to provide." Not only of course was this the case in Ireland, but throughout Christendom. Although the "principal knowledge we have of the former existence of chalices made of these rude materials is derived from the ordinances of ecclesiastical councils," a few specimens are still extant. The

EARTHENWARE CHALICE OF ST. JEROME,

still preserved in the Church of St. Anastasia at Rome, is one, while the stone chalice preserved in the collection of the Royal Irish Academy is another. In his labour of research Mr. Ffrench has not been able to discover any wooden chalice in Ireland that can be "really identified as a church cup;" yet he tells us that such vessels must have remained long in use, for the simple reason that they were prohibited as late as the year 787. Mr. Ffrench believes glass to have been the earliest material used in the construction of Irish chalices, and quotes from the Tri-partite Life of St. Patrick to show that in the days of Ireland's great apostle glass chalices were certainly in use. One of these rare and curious chalices was, moreover, actually discovered in our own times by some workmen who were pulling down portion of the walls of the old Church of Tallaght. It is interesting also to note that the famous cup of the Musgraves of Eden Hall, familiarly known as the "Luck of Eden Hall," is, indeed, a specimen of one of these

RARE AND ANCIENT GLASS CHALICES.

Coming to the employment of metals in chalice workmanship, we find that brass, bronze, and copper have been especially identified with the use of the early Celtic Church, while, adds Mr. Ffrench, "I think we can fairly infer that they were introduced into Ireland by St. Patrick himself in order to supersede the easily-broken glass vessels. Ireland being a centre of bronze workmanship, would be a place where we might expect to find chalices of that substance." Thus, in the "Tri-partite Life," the following occurs: "The holy Bishop Assicus was Patrick's coppersmith, and he made altars and quadrangular patens and quadrangular book-covers in honour of Patrick." "Now, what could be more natural," remarks Mr. Ffrench, commenting upon the foregoing passage, "than that the artificer who constructed one of the sacramental vessels of copper and bronze should construct the other of a like material?" While Mr. Ffrench further recalls the interesting fact that the celebrated Celtic St. Gall, founder of the Abbey of St. Gall, in Switzerland, when offered a silver chalice declined to accept it, saying that his master, Columbanus, was wont to offer the Sacrifice of Salvation in brazen vessels, because our Saviour is said to have been affixed to the cross with nails of brass. Neither pure copper nor bronze chalices seem to be extant among Irish collections of the present day; though, on the other hand, a copper paten was found

in the grave of St. Tigernan at Erren, a promontory of Lough Con, which has been dated as far back as the close of the fifth century. But, as the writer well puts it, "although we have not a chalice made wholly of either copper, brass, or bronze, we have a cup in which all these materials occupy a prominent place"—namely, in that

"NOBLE SPECIMEN OF EARLY CELTIC ART,"

the far-famed Ardagh Castle. In this, bronze, brass, copper, lead, gold, and silver are used, while the decoration of the cup includes no less than three kinds of enamel, besides crystals and amber. Miss Margaret Stokes has declared, as Mr. Ffrench reminds us, that nothing so lovely as the Ardagh Chalice has been found in Celtic, or perhaps in any Continental art, at so early a period. Moreover, from this beautiful cup, which is two-handled, we are enabled to fix the shape and dimensions of the finer chalices during the Celtic period. Of two-handled chalices there are now many specimens still in existence on the Continent, of which the most important are Tassilo Chalice, preserved near Wels, in Lower Austria—a cup specially interesting to us because it betrays in its workmanship the decided influence which Irish ecclesiastical art exercised on the Continent of Europe in the reign of Charlemagne. It is made of

RED COPPER OVERLAID WITH SILVER WORK,

and it is ornamented with representations of the four Evangelists in the style of Irish illuminated books of the seventh century. Visitors to Venice will also find among the ancient chalices preserved in the Tesoro di San Marco several which bear strong resemblance to the Ardagh Cup. Pewter chalices were also used in Ireland, being expressly permitted by the Canons passed at the Provincial Synod held in Christ Church Cathedral, Dublin, in 1186, and continued in use to our own day. Interesting specimens of these from the old Celtic shape to the more modern forms may be seen in the Museum of the Royal Irish Academy. A chalice of ivory was exhibited not very long ago at a meeting of the Royal Society of Antiquaries. But, of course, we scarcely need to be told that even from very early times gold and silver, the precious metals, supplied the favourite materials for Church plate. The Annals of the Four Masters tell us of the chalice of gold presented by Princess Dearvorigil, wife of O'Ruairé at the consecration of Mellifont Abbey. But it is sad to be reminded that not a single chalice of gold or silver has come down to us

FROM PRE-NORMAN TIMES.

To the barbaric devastations of the Norse invaders we doubtless owe the loss. The warfare of the Dane in Ireland was, as Mr. Ffrench reminds us, quite as much a crusade of fanatical paganism as an expedition of invasion and conquest. In their hands the sacred vessels of the Christian Church would be little likely to meet with reverence or even preservation. No doubt they stole them for the sake of the precious metals contained in their material. Yet, almost beggared as Ireland has been in this respect, enough still remains to prove that this country contained at that time a school of workers in the precious metals, who produced objects which, for "gracefulness of outline, refinement of feeling, and artistic skill displayed in their construction have never been surpassed, and of which we are justly proud." It is sad to be told that "after the coming of the Normans Irish Art began to pine and die. The hard-headed, heavy-handed soldiers who acquired dominion over the country had little time to devote to the fine arts, and the sacred vessels used in their services would naturally bear the impress of the Norman and not of the Celt. Irish Art lingered in the places where the Celt still held dominion, but it was no longer a bright light—it was only the shadow of its former self a flickering in the socket." Mention is made of the 17th century revival of Irish Art in ecclesiastical vessels, of which revival many excellent specimens are still preserved. The illustrations given of the Kilmore, Adare, Mayler, Cloonclare, and Kilkenny chalices show that Irish 17th century art was deserving of considerable respect,

The Decoration of Modern Churches.

WE noticed last week one of the most interesting of the subsidiary institutions connected with the Church Congress at Bradford—the Ecclesiastical Art Exhibition. In addition to this exhibition, the Clergy and Artists' Association has organised a similar show, embracing historical and decorative Art. The exhibition is not a large one; one end of the Corporation Art Gallery suffices for the display; but the works shown are so full of interest, and are so suggestive to the art student and art lover that they well merit a careful inspection. The association, whose object is clearly stated in its title, has been in existence for some three years, its first exhibition having been opened at the Shrewsbury Church Congress, when Mr. W. Holman Hunt, who has displayed much interest in the organisation, read a paper on the subject with which the association is concerned. Last year's exhibition at Nottingham received a good deal of attention, and it is hoped that in time the Association may do something to improve taste in many directions. Four or five hundred years ago

THE BEST THAT ARTISTS COULD DO

went into the churches, and there is no reason, say the members of the Association, why the decoration of modern churches should be confined to journeymen painters' stencil patterns, to framed oleographs and machine-made carving. Mr. G. F. Watts, R.A., contributes to the present exhibition three pictures, "The Creation of Eve," "The Curse of Cain," and "Time, Death, and Judgment," the last named a varied replica of the great picture which the artist has contributed to the decoration of St. Paul's Cathedral. All three works are full of the vigour and vitality and the exquisite colour and drawing which mark the master. He also lends a very delicate and characteristic drawing by the late Sir Edward Burne-Jones in illustration of the "Song of Solomon"—one of a series done for the Kelmscott Press. Sir W. B. Richmond, R.A., sends some sketches, working drawings, and mosaic studies for the noble series of decorations in mosaic which he is executing in St. Paul's Cathedral. Mr. W. Holman Hunt lends two small water-colours,

"JERUSALEM FROM THE WEST,"

showing the Fortress and the Tower of David," and the other of "Bethlehem." Both are, no doubt, topographical studies of some of the artist's pictures, and both are marked by minute, almost photographic, fidelity of detail, as well as by good colour. There is a large picture by Mr. Byam Shaw of "The Comforter." What a different place the chapel of a cemetery would be with a few such works as this! The decoration would be appropriate, for the picture is not one merely to admire, but has deep spiritual purpose and power. These are practically the whole of the pictorial works, and the greater part of the wall space is occupied by decorative designs. There are a number of interesting pieces of

WORK IN RELIEF,

including a finely-modelled design of the Annunciation by Miss Hermione Unwin. Mr. Conrad Dressler and Miss E. M. Rope contribute works executed in high relief in glazed earthenware. These are animated by a very high feeling, are really a revival, though not in any sense a copy, of the work of Della Robbia. Like the work of the Della Robbias, they are intended mainly for poor churches, though they would do the wealthiest no discredit. Another departure which promises a future of usefulness is seen in a number of small memorial tablets in bronze for graves. These are executed with taste and feeling, yet can be sold at prices to compete with the execrable enamelled iron wreaths which seem to be the only graveyard memorials within the reach of the pockets of the poor. The exhibition includes a large number of examples of architectural decoration and a few examples of brass work, among which must demand special mention some fine brass work by Mr. Bainbridge Reynolds,

YE POOR OLDE ENGLAND.

AN ARCHITECTURAL JOKE AT
EARL'S COURT.

BY BULKELEY CRESWELL.

"We will now pass into PICTURESQUE ENGLAND, in discussing which admirers of old-fashioned Architecture invariably expend many adjectives."

IT is with these words that a writer in the "Guide to the Earl's Court Exhibition" introduces his readers to a description of the "old English town" which now, for a second year, forms one of the advertised attractions of the place. One has no reason to doubt the accuracy of this writer's observation, nor the exactness of the terms in which he has reported it, and consequently, can only say that one is shocked and grieved to know that what he says can be true. Although, under certain circumstances, it may be palliated, and to a certain extent excused, nevertheless, the habit of bad language is most reprehensible, and cannot be defended, and the above explicit statement of a personal observer as to its widespread frequency, is humiliating and painful to read. At the same time one is glad to know that one's own lapses from strict decorum of expression on visiting "Picturesque England" were not due to any inherent personal depravity, but rather to the common frailty of humanity; for one is, above all things, an admirer of old-fashioned Architecture, and it will be noticed that, in the above quotation it is precisely stated that in discussing the spot, admirers of old-fashioned Architecture invariably use these violent expressions. Indeed, "Picturesque England" is calculated to make intelligent humanity exacerbate, as naturally as pepper may be expected to make it sneeze. For these reasons one is consoled by the belief that the impolite, discourteous adjectives into which one was betrayed at the first brunt of "Picturesque England" are in the main excusable.

At the outset the whole crowd of these incongruities, anomalies, and anachronisms, bunched together and tied about into a wisp of sentimental inanity, (for this is a fair description of "Picturesque England" and its kind) is wholly repugnant to anyone who has any reverence for, or appreciation of, the traditions and arts of the past. In its beginnings the thing held some claims upon

sanity and intellectual decency, when the literal reproduction of some historic spot was attempted. Specialists were employed, care was not grudged to insure that the reproduction should be exact in its particulars, and the persuasiveness of the whole spectacle was sought to be advanced by attention to minute details of costume and furnishing. Now, however, there is no better contriving than may be effected by the employment of some uneducated person, or persons, who succeed only in raising a tawdry, staggering old monument to the proverb, "A little knowledge is a dangerous thing." Among the absurdities which this form of entertainment has fostered is a ridiculous jargon. It consists chiefly in putting the signs "Ye Olde" before the nouns in a sentence; in a frequent interjection of the cypher "ye" or "Ye," and of doubling the last consonant of a noun and adding "e" wherever possible. Thus "Ye olde Shoppe." This does not mean at all that the "shoppe" is necessarily "olde," nor, so far as one has been able to learn, anything else, except that where the hieroglyphics appear a man may reasonably expect to be able to buy a sixpenny thing he does not want for a shilling.

One refers to this jargon because the diction it seeks to reproduce belongs only to a date long previous, for instance, to the Elizabethan epoch, so that it is a complete anachronism, and its use provokes scepticism on at least three points of tradition which are involved in it. First, granting that this fantastical language is a graceful or a beautiful thing, which one emphatically declines to do, can we believe that a similar inanity of speech existed in the seventeenth or eighteenth century (the conjectural date of some of the Architecture of Picturesque England), when we know that there were no "exhibitions" to cherish and foster it? Second, is there any reason to suppose that our forefathers had the intuition to know that everything about them was in reality old; and did the young journeyman, when he took him a wife and set up in business, really grasp the fact that he was merely an ancient tradition of the nineteenth century, and accordingly so soon as his shop was built, call it "Ye Olde Shoppe," as the popular exhibitions would have us to believe?

FIG. 4. YE OLDE PENNYWISE PORTICO.

Third, is there evidence to show that our forefathers never built in new material, but selected always decayed and lichen-covered stones, mildewed plaster, and warped and worm-eaten beams, such as would justify the directors of architectural reproductions in consistently showing us ancient buildings mouldering in rot and semi-ruin at what is avowedly the heyday of their prime? One would unhesitatingly answer all these questions with an unqualified "No!"

It was upon this affectation of language one expended one's first adjective on entering the domain of "Picturesque England." There is a machine called a Mutoscope, which is the newest and latest development of the ingenious mechanical contrivances that give us the moving photographic pictures. On entering under the portals of "Picturesque England," which are constructed in a wonderful segmental arch of hewn rocks such as no man born ever built, one was greeted with the legend—YE MUTOSCOPE. From that point onward the violent expressions referred to in the above extract from the Guide to the Exhibition were called forth in an unconscious ever-flowing stream of vituperative criticism, punctuated with an expletive or so, by the long expanding vista of bland errors and complacent smiling absurdities offered to the visitor in the name of old Architecture. Some of the most accessible instances are slightly sketched in these pages to illustrate and establish the fact of what is here described; but the true banality of the designs is lost in a drawing, and the spot is so rich in materials that a whole issue of this Journal would scarcely avail of them to the full.

In justice to the "inventor" (shall one say) of "Picturesque England," however, one will take his old Architecture in the spirit in which it has been presented; and regard it, not as a folly, but as a serious archaeological effort worthy of serious criticism. One confesses to a certain apprehension at the task: one steps forth out of the realms of all known rules of construction and tradition, and one's confidence grows weak at the knees. It is true that most of the designs may be vaguely allocated to some general epoch with a show of plausibility, although they belong to no style of Architecture yet evolved; but how is one to describe a portico such as No. 4, which is like nothing but a conjectural restoration of members dug up during excavation on the site of the ruins of Pimlico, in the year 3000 A.D. The text books give no information upon the subject of the architectural styles represented in "Picturesque England," nor do they afford any clue to their origin or meaning, and accordingly one has sought to make good this hiatus and supply an additional chapter in the history of Architecture.

FIG. 1. YE OLDE SPATTERDASH STYLE.

FIG. 7. YE OLDE SHELF CAPITAL.

On entering upon the Old English Town from the central gardens the visitor is first struck by the open colonades that go rambling away on all sides, round corners, and at many changing angles, in a praiseworthy attempt to be picturesque. The most notorious curiosity contained in these colonades is the spacing of their columns. The various classic rules of intercolumniation had each an appropriate name; the more lax methods of the Renaissance builders called for no such distinctions; but when we come to light columns some 8ft. high, spaced 12ft. or 14ft. apart, and spanned by a stone lintel, whose section measures only about 9in. by 4in., such as we find here, one feels that the system not only deserves a name, but such a name as language can scarce compass. Here then is an opportunity such as shall put the philologists on their mettle. Another thing that will early arrest the visitor's attention is the frequency of a certain style of design wherein, it would seem, the walls are run up plain, and the various window heads, strings, cornices, pediments, brackets, and other members and ornaments being arranged ready at hand, are stuck on very skilfully and quickly while the building is hot. This style, after mature deliberations, one has christened "Ye Olde English Spatterdash Style." The illustration numbered 1 is a fine example of this rare old style. The maker evidently had a quantity of old adhesive string-courses and brackets left on hand, and he has availed himself of them, with great variety and precision by arranging a running scheme of pediments, with a bracket firmly fixed at the apex of each, and by putting a much bigger pediment of the same string-course material over the centre. As this is more than twice the size of any one of the pediments below, the artist has, with discernment, allotted not one but two brackets to it; but instead of putting these side by side under the apex of the great pediment, as we should expect, he has, with a nice skill and discretion, separated them and stuck them to the wall, one on each side of the fireplace, in

FIG. 2. YE OLDE SPATTERDASH STYLE.

the true classic feeling. His use of the pilaster cap, too, is masterly; having only one of them the difficulty of using it without disturbing the balance of the elevation must have been almost insuperable. Everyone will agree that the cap would not have looked so right at the side as it does underneath the hearthstone, as shown. The second sketch gives also a valuable example of "Ye Olde Spatterdash Style." The reader will ask: What is the triangular decoration above the window? But one really does not know. It is a form of ornament which must be considered to belong exclusively to this fine old style. The two fancy escutcheons, which are here so aptly placed one on each side of the window, are also of interest. They occur throughout "Picturesque England" of this one exact pattern, and have been attached with equal success to stonework and plaster without reference to style or date.

The reader will note ye olde English door as shown here and elsewhere. Through all ages, whether in conjunction with half-timbered or stone buildings or brick ones, or in Gothic, Renaissance, or Classic styles, these fine old doors always consist of square-framed panels with a triangular, elliptic, or lozenge-shaped slice of wood, glued strongly into the middle of each. Sometimes these decorative additions are enriched and carved after the model of a shortbread cake.

Closely akin to "Ye Olde Spatterdash" style must be considered that which one has named "Ye Olde Pennywise Style." Its vital characteristic consists of leaving out what have hitherto been considered the essential members of a design. In the examples here illustrated we have a portico with no caps, and a pediment with no cornice, and the colonades above described also belong to this style.

Among the most interesting specimens of Architecture is a hitherto unknown Order, which evidently owns to an origin in the last century, when gentlemen wore decorative waistcoats and aspired to account for two bottles of port wine every day after dinner without winking, and thereby win the distinction of being called "Two-bottle men." Accordingly one has christened this hitherto unrecorded architectural Order "Ye Olde Two-bottle Order," from its obvious sympathetic relation to this epoch of diners. The reader will observe the base of this interesting specimen, which is here detailed. It is simplicity itself. The cap eulogising, on each side, the rich curls of the bag wig, the huge gaping mouth and row of heavy teeth, and the extremely short neck of the diner, is very fine and suggestive. Another feature of this style is the "pseudo-balustrade," a balustrade, that is, which has half melted and run into the wall. The last sketch shows a very ingenious arrangement of a column and lintel of a portico. Instead of the column coming under the lintel it is set in front of it, thereby offering the great convenience of a roomy shelf, whereon the housewife may stand things out to cool, or, if she prefers, set a pot of geraniums.

The premises of the St. George Liberal Club, Bristol, have been entirely renovated.

A DRINKING-FOUNTAIN at King's Norton has just been unveiled. It has been erected by Messrs. Roddis and Nourse, sculptors, Aston Road, North Birmingham, from the plans of Mr. W. De Lacey Aherne, architect.

The very interesting and valuable collection of Oriental objects of Art formed by the Marquis of Dalhousie, when Governor-General of India between 1848 and 1855, will be offered for sale in December next by Mr. Dowell, of George Street, Edinburgh. The collection comprises Oriental arms, armour, and jewels, such as gold inlaid and jewelled shields, jewelled scimitars, swords, &c.

An Ancient Perthshire Church.

THE ancient church or chapel of Innerpeffray, situated in an elevated position near the river Earn and fully three miles east of Crieff, has recently been restored. The old collegiate church had, during a long course of years, been allowed to fall into a state of general disrepair. The roof was not only getting into a dilapidated condition, but the walls and general interior of the building—in which so many of the ancient and noble dead of the district repose—had also been

MUCH NEGLECTED.

The right of burial in the church is retained, says the Scotsman, by three of the landed families in the district—namely, the Earl of Ancaster, the present head of the House of Drummond, Drummond Castle; Viscount Strathallan, the representative of the Drummonds of Strathallan; and the present proprietor of the estate of Innerpeffray—the Hon. Captain Hay Drummond, a brother of the late Earl of Kinnoull. Some time ago these three custodiers resolved to have the old church put into a proper state of repair, and this has now been very satisfactorily accomplished. It is said that the date of the first building of the chapel is not known, but it must have been at a very early period, as there is a record of certain deeds having been signed in it in the year 1283. In all probability there was some

FIG. 6. DETAIL OF YE OLDE ENGLISH TWO-BOTTLE ORDER.

official connection between the Church of Innerpeffray and

THE ABBEY OF INCHAFFRAY,

founded in 1198, and which is situated a few miles further east. At any rate, there is authentic record of Innerpeffray Chapel in 1342, and it was made into a collegiate church in 1508 by the first Lord Drummond, who is described as the first Provost of Innerpeffray. Authentic information in this respect is supplied by the Rev. John Fairbairn, minister of the adjoining parish of Madderty (1620-1657), who was a relative by marriage of the Drummonds, and who in an account of the House of Drummond, says:—"John, Lord Drummond, having re-edified the Chapel of Innerpeffray from the ground, and erected it into a college for some few prebendaries to pray for requiems for him and his house, ordained it to be their burying place for all time coming, and being nearly eighty years of age, he framed one of the most material and peryfte testaments that ever I saw, and syne closed his eyes and time togidder, and was most honourably interred in Innerpeffray Chapel in year 1519. On June 4th, 1507, the King confirmed in mortmain the charter of John, Lord Drummond, by which, for the souls of the King and Queen, for his own soul, and that of Elizabeth Lindsay, his wife, and the umquhile Margaret Drummond, his daughter, &c., he granted as a pure free alms-gift to four chaplains to celebrate the Divine offices for ever at

THE FOUR ALTARS IN THE CHURCH, dedicated in honour of the Blessed Virgin, of Innerpeffray, an annual income of forty

FIG. 5. YE OLDE FESTIVE OR TWO-BOTTLE ORDER.

merks from his land of Innerpeffray and Dunfallys, with houses, residences, and gardens, to be marked off and built for each, with the right to each of them of obtaining necessary fuel in the common mure of Innerpeffray, with four-sums for grasses and for one horse." The chapel now stands as "re-edified" by John, Lord Drummond. According, however, to archaeologists, the western portion of the edifice was not rebuilt by Lord Drummond, as that part shows evident marks of greater antiquity. The chapel is a long, low, narrow building, measuring about 80ft. in length and 22ft. wide, and is still entire, with the exception of the sacristy near the north-east end, which had communicated with the chapel by an arched doorway, still remaining, although now built up. One peculiarity in the church is the round chancel archway, placed about 8ft. from the west end, which appears to have formed a vestibule, having evidently been filled in by some sort of a wooden screen, judging from the holes cut in the stone arch and pillars. In the wall of the arch there is an oblique opening, known as a "squint." It is rarely, if ever, seen in ecclesiastical buildings, and was, it is said, used by those who were late in attendance to hear mass, without attracting the attention of the priest. A narrow circular stone stair in the north-west angle leads from the vestibule to a room immediately above, which was a small window and fireplace, and a bevelled opening in the wall over the arch looking into the church, and is said to have been used by David Drummond, third Lord Madertie, during public worship. (This Lord Madertie was the founder of the ancient library that is stored in the house closely adjoining the church, he having, by his will, dated 1691, bequeathed the half of 6000 merks for the maintenance of the library and schoolhouse which he had erected at Innerpeffray.) It is also stated that the small room referred to was used by Lord Madertie for holding his books, and where, after the death of his second wife, Lady Beatrix Graham (sister of the great Marquis of Montrose, whose Bible, with autograph inscribed, is still in the library), he spent a large portion of his time. The ceiling of this western portion of the chapel bears traces of having been all

PAINTED IN BRIGHT COLOURS,

and has a representation of the sun, with clouds around, and until lately had the figure of an angel appearing out of the clouds blowing a trumpet held in the hand, but that portion has been destroyed. There now only remains a small part of the ceiling, and steps

have been taken to preserve it. The church originally had three doorways, secured by wooden drawbars on the inside. The jambs and lintels have been elaborately moulded, and the windows are double-splayed, and filled in with strong iron interlacing bars. The south doorway is arched and moulded in the inside, with moulded corbels. The door in the west end is supposed to have been one of the entrances to the original chapel, and was allowed to remain. Two small doors in the north side of the building are built up, one of which had apparently served as an entrance to the chancel. On the south side one of the original doors has been made into a window, and one of the windows now forms the door on that side. What is called the "stoup" is placed on the right-hand side of the south doorway, and is of plain design, with projecting bracket.

A STONE ALTAR

is still intact, and stands against the east wall. A number of consecrated crosses are to be seen on the walls of the interior; and one evidence that the west end of the chapel is of much earlier date than the eastern portion is shown by the finding on the west wall of two crosses of dedication and consecration—one on either side of the door. In ancient chapels the usual number of such crosses was seven, and six have now been discovered in this church. Traces of painting are also still visible in some portions of the plaster work. Externally, the gables have crow-steps, and in the east one there is a niche with a bracket, in which evidently there was a statue of some saint—probably the

Virgin Mary, to whom the chapel was dedicated. Two shields, bearing the three bars wavy, gules—the coat of arms of the Drummond family—are also to be seen on the outside walls. It may further be mentioned that at each of the four corners of the old graveyard beside the church there stood what was called a "roundle," or small tower, and one of these remained up till about the beginning of the present century. The "roundle" was stated as consisting of a ground floor, and a room, with fireplace, on the next floor. It will thus be seen that this ancient ecclesiastical edifice is one of much historical and antiquarian note; and it, along with

THE OLD LIBRARY

adjoining and its unique collection of books, as well as the old Castle of Innerpeffray, also near by, are of great interest, and are resorted to by many of the visitors from all parts of the kingdom who annually sojourn in Strathearn. The roof of the chapel has been thoroughly overhauled and repaired with stone slates in keeping with the old roof. A great improvement has also been made by the removal of the soil all round the church, and exposing a fine dressed double base course, which was perfectly hid before. Handsome home oak doors have been put on, studded with iron bolts, and all the windows have been opened up. The floor of the chapel has been levelled, and for the most part gravelled, and turf laid over the graves. Altogether the repairs and improvements carried out in and around the chapel are such that will preserve intact this ancient landmark—now over five centuries old—for many years to come; and Lord Ancaster and other proprietors merit warmest thanks and commendation for their generous conduct in the work of renovation. The various improvements were carried out under the personal supervision of Mr. G. T. Ewing, architect, Crieff.

The Mayor of Gloucester has laid the foundation stone of a free library.

ALTERATIONS are being made to the Congregational Chapel, Yeovil, under the direction of the architect, Mr. J. N. Johnston. Special consideration has been given to the ventilation, which will be carried out on the Boyle system.

FIG. 3. YE OLDE PENNIWISE PEDIMENT.

THE ORIGIN OF DENE HOLES.

AN ARCHEOLOGICAL PROBLEM ANSWERED.

THREE years ago, under the title of "An Unsolved Mystery," the Daily Graphic published an account of the "Dene Holes" which are to be found excavated in the chalk in various parts of Essex and Kent, more especially in Hangman's Wood, near Grays, in Essex, and in two woods—Stankey Wood and Cavey Spring—near Bexley. Precisely described, a dene hole consists of a vertical well-like shaft, fifty, eighty, or even one hundred feet in depth, and three or four feet in diameter—passing down through the overlying sands and gravels into the chalk beneath—in which are excavated several large and lofty chambers, arranged more or less symmetrically around the bottom of the shaft. In Hangman's Wood, which is a small copse some four acres in extent on a chalk slope overlooking the Thames Valley, there are no fewer than seventy-two dene holes, clustered as closely together as was possible, their entrance shafts being on an average not more than 20yds. distant from one another. The

SIMILARITY IN THE GENERAL PLAN

of all the pits in Hangman's Wood is so close that a description of one will serve practically for all. The entrance shafts of all the pits run vertically downwards, through the material known to geologists as the "Thanet sand," for about 56ft., when the chalk is reached. This in its turn has been penetrated for about 25ft. before the level floor of the pits—about 80ft. below the surface of the ground—has been formed. At the bottom of the shaft is an open space or "vestibule," round which are ranged six crypt-like chambers, nearly always of the same shape and arranged on the same symmetrical plan. Exactly opposite to one another at either end of the vestibule are two main or primary chambers, while on either side of the entrance to these are somewhat similar "lateral" chambers, making six in all for each pit. In nearly all cases the ground plan is practically the same, the chambers being arranged in a double-trefoil pattern. The average length of a chamber is about 30ft. (reckoning from the entrance and not including the vestibule), the height about 18ft., and the width 11ft. or 12ft. What gives to the Dene Holes at Hangman's Wood

THEIR MOST CURIOUS ASPECT

at the present day is that many of these underground chambers have been put into communication one with another by the excavating industry of investigators, so that by descending into one chamber it is possible to find access to sixty-five others. In other respects the Dene Holes are blank of any remains which would testify to their origin, and the only interest attaching to them was the interest born of speculation as to what their uses could have been. Little is known of their history during the Middle Ages, though it is said that in the days of Henry IV. the Dene Holes near Grays were regarded as the deserted gold mines of King Cunobeline, and that the working of them was actually begun again with the object of extracting gold. It is certain that among the many wild-cat schemes sprung upon the investor at the time of the South Sea Bubble one for working these ancient "gold mines" was floated and collapsed. In the last hundred years they have been examined by archaeologists several times, but until very recently no one could agree upon their use or origin. The theory most generally held was that they were

MERELY OLD CHALK PITS,

but most of their friends and patrons refused to entertain this view. Why, they asked, should any country wanting chalk have dug through 60ft. of superimposed strata to get at chalk which outcrops on the surface a mile away? And why was such care exercised that none of these chambers should communicate—though, as shown by the excavations of enquirers during the last ten years, a very

short tunnel would connect one chamber with another? The theory of chalk workings was, therefore, abandoned in favour of several others more picturesque. Some suggested prisons, others that the dene holes served some devotional purpose. "Burial places" was an ingenious suggestion; "habitations" was disposed of by the fact that any race so using them would be quickly exterminated by rheumatism; and they were certainly too capacious to be used as storage places for grain, which some inquirers thought a likely thing. Several correspondents have pointed out their great usefulness as places of refuge and concealment in time of invasion, though a dene hole is almost the last place in which a man would care to be found by his enemy. One correspondent sent three theories. The first was that they were places of punishment, and that the word "denn" among the early Saxons signified a cave or a place of doom. The usefulness of this theory is discounted by the fact that dene holes were excavated some centuries before the Saxons reached the country; and this objection applies to a second suggestion that "dene" may be a corruption of "Dane," and that seventy-two—the number of dene holes in Hangman's Wood—was also the number of divisions of the Wissenges or Belgæ. Nor could we accept a fourth theory that tribal societies may have had their secret meetings there. Strange as it may appear, the most commonplace of all the theories is the correct one. They were, the Daily Graphic has discovered, merely chalk-pits. The best possible proof of it is that in another part of England quarrying for chalk had been carried on up to the middle of the present century by means similar to those which were responsible for the form and

CONSTRUCTION OF THE DENE HOLES.

In a paper recently written by Mr. Charles Dawson, F.S.A., F.G.S., he describes some chalk workings in the centre of East Sussex, in a neighbourhood many miles away from any railway station, where is exposed a series of rocks known as the "Purbeck Beds." The whole of this area is covered with countless thousands of pits resembling the dene holes of Essex and Kent. They represent, in fact, the result of the usual method of procuring the limestone wherever the stone is quarried from a depth below the surface of the ground. The workmen, who with their forefathers have been accustomed to this industry all their lives, perform the work with wonderful celerity. The stratum of stone having been ascertained to exist near the surface, a well about 3ft. to 4ft. in diameter is commenced in certain blue and brown shales, and usually reaches the limestone within 40ft. (sometimes 50ft. or 55ft.) from the surface. The cavity above the stone is then belled out on all sides to a diameter varying with the stability of the strata. Sometimes the cavity is 15ft. or 16ft. in diameter, sometimes considerably more. The stone is then removed, and four small arched lateral chambers are dug at four equidistant points in the side of the bell-shaped cavity, so as to extract as much stone as the pitman dares without endangering his life. While the last pieces of stone are being removed from the pit one of the men begins another shaft about 6yds. away, so that it may be well forward by the time the other work is completed. Sufficient room is scrupulously left to prevent one chamber encroaching too near to the other, and it is therefore necessary to adopt some

REGULARITY IN THEIR DESIGN.

And so the operation is repeated over and over again without any variation of importance. There are three questions which occur to those who do not approve the chalk-pit theory:—1. Why are they frequently clustered together; and although they are dug so close to one another, yet are they never intentionally connected? 2. Why are they all constructed on the same general design and seemingly elaborate ground plan? 3. And why were they dug for chalk when chalk itself occurs on the surface less than a mile away? To the first and second of these the chalk workers them-

selves reply that the way they work the chalk occupies less time, is least expensive, and that they work always on the same general design, because they know by experience that it is a safe one. Indeed the whole operation of digging a well and getting out the stone is only a matter of a few days, and they then fill one pit with the debris of another. The limestone has, however a bad trick of thinning out very rapidly within a short distance, and partly for this reason and partly for the economy of surface space

THE PITS USUALLY OCCUR IN CLUSTERS.

With regard to the third point, the chalk is usually used as a "chalk dressing" for agricultural purposes. The chalk obtained from a depth is much better suited to this purpose than that obtained from the surface, which, so the older agricultural writers maintained, was "very indifferent, and only fit for lime to be laid on the roads, gateways, &c." Nor was the method of digging for chalk thought to be at all expensive compared with that of bringing it from a distance in carts. In fact, Mr. John Bannister, writing in 1799 of the practice of "chalking," observes that the plan of sinking a pit in a field where chalk is intended to be laid as manure "is far preferable to that of drawing it in carts." Altogether Mr. Charles Dawson's contention that dene holes are chalk-pits pure and simple seems to be established and incontestable.

THE IMPORTANCE OF CISTERNS.

DR. SEDGWICK SAUNDERS, Medical Officer of Health for the City of London, reporting to the Sanitary Committee of the Corporation, states that the difficulties which had arisen in consequence of the enforced suspension of the "constant" service of the East London Waterworks Company had not depended exclusively on a diminished supply, but rather on the absence of the means of proper storage of water for domestic and sanitary purposes. The abolition of cisterns in houses of any class was bad enough, but in those divided into tenements for the occupation of the poor, the want of such receptacles involved an amount of suffering wholly inconceivable to persons possessed of such conveniences. It was a well-known fact that whereas in the area supplied by other companies the existence of cisterns in houses was practically obligatory, the system was objected to by the East London Company. To what extent the abolition of such receptacles for storing water was responsible for the misery inflicted upon the poorer customers of the Company need not here be discussed. Suffice it to say that, when the day of reckoning came, the Company would have to show better reasons than had hitherto obtained for their action in that respect. The area supplied by the East London Company in the City affected 133 houses, with a population (day and night) of 1709. Of these houses 77 were without cisterns and 33 had constant service, 43 were tenements, and 12 empty premises. The water was turned on three times a day—viz., 6 a.m., 12 noon, and 6 p.m., for two hours each time; and, when it was remembered that a very few years ago the New River Company's general supply to the City was only turned on for one hour a day, and often less, it seemed an absurdity to apply the term "water famine" to the East of London, more especially as the Company's representatives averred that the present supply equalled 24 gallons per head—an amount much in excess of that furnished to some of the most important provincial towns. The 77 houses without cisterns had no means of flushing the drains and water-closets when the water was turned off, and some of the latter were in an unspeakable condition. In advocating the use of cisterns, it must not be inferred that a direct supply from the main for drinking and cooking purposes could be dispensed with.

THE Town Council of Southampton has just adopted a new code of by-laws with respect to new streets and buildings.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
October 5th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE only structures in Japan which seem to be earthquake proof are the pagodas which are erected before the temples. There are many which are seven or eight hundred years old, and as solid as when first built. There is a reason for this, and it lies in their construction. A pagoda is practically a framework of heavy timbers which starts from a wide base, and is in itself a substantial structure, but is rendered still more stable by a peculiar device. Inside the framework, and suspended from the apex, is a long, heavy beam of timber 2ft. thick or more. This hangs from one end, and to the other end are bolted, at each of the four sides, four more heavy timbers, and if the pagoda be very lofty, still more timbers are added to these. The whole forms an enormous pendulum, which reaches within 6in. of the ground. When the shock of an earthquake rocks the pagoda, the pendulum swings in unison, and keeps the centre of gravity always at the base of the framework.

So much antiquarian and architectural interest attaches to the cloisters and crypt of the Chapel of St. Stephen's—the only portions of the old Palace of Westminster which escaped destruction by fire in 1834—that the news of a somewhat awkward subsidence in the foundations of the former will be much regretted. Fortunately the authorities have discovered the weakness before any serious damage has been done, and labourers are now at work laying a bed of concrete preparatory to inserting iron girders at the point where collapse seemed most to threaten. Pending the completion of the operations now in progress, which have necessitated deep excavations on both sides of the cloister wall, the superstructure is shored up by huge baulks of timber. The attention of the authorities was first drawn to the subsidence by a couple of ugly cracks in the masonry near the cloak-room entrance, but a more minute examination revealed the fact that close by a section of the beautiful groined roof had begun to give way. As soon as the immediate defects have been remedied the foundations of the other parts of the cloisters will be carefully overhauled with a view to safeguarding the building against the possibility of further mishap.

It is not often that a whole town is razed to the ground to make room for new fortifications. This, however, is exactly what is happening at the present time in British Columbia. Esquimalt, B.C., has for some years now been a thriving little town on Vancouver Island, having a population of about 1500. It is built

on a jutting peninsular, and commands a magnificent strategic position. The War Department decided that this position would be the very place for an impregnable fortress; so a notice is being served on all Esquimalt landholders informing them (says the Daily Mail) that the Government desires to pay them fairly for their land and house property, but that, in any case, the greater part of the town has to come down, in order to make room for the arsenals, docks, and fortifications that the Government proposes erecting.

Two or three weeks ago a couple of men of the Engineers walked through the town, and wherever directed by an officer accompanying them, drove deep into the ground a little iron post. Their stroll took the trio along the Victoria-Esquimalt Road from the canteen field, past the picturesque parish church of St. Paul, and down "the one street of the little town" to its termination at Esquimalt wharf. The posts are still in position, with the letters "W.D." (the sign of the War Department), and the significant broad arrow beneath, to tell the residents of the place that the time is approaching when the town is to be officially effaced. For many months past hundreds of men have been employed in the fortifications at Esquimalt. A store, repair, and supply station are to be built, and the fort will be so manned as to make them capable, if possible, of defending the place against any foreign force whatever its strength. The Government's plan also embraces the providing of every necessary building appertaining to a naval station. The history of Esquimalt has been from first to last one of steady expansion and development, and the station owes its existence to-day chiefly to geographical conditions. The town was originally founded by the Hudson's Bay Company, which used it as one of their outposts. Esquimalt of the future has already been dubbed in engineering circles "The New Gibraltar of the Pacific."

AN interesting exhibition is now on view at St. Martin's School of Art, Castle Street, W.C., consisting of work done by the students in the past year. As in former cases, designing in every form is the great feature of the teaching given, and valuable rewards and prizes have been gained by the students in this branch of Art. Although much attention is given to designing, other subjects are not neglected. There is a good life class, under a qualified master, both for figure and costume. There is also a special class for carriage building in connection with the City and Guilds of London Institute. In the examinations of the Science and Art Department the students have gained thirty-nine advanced certificates and 108 elementary certificates.

THE new part of Mr. Percy Thomas's noble serial devoted to the Temple and its principal architectural antiquities and associations comprises excellent etchings of the interior of the famous round church and of that quaint survival, the Temple Cloisters, which, though they date, as a familiar inscription in Latin testifies, no further back than 1681, when this part of the Temple was rebuilt after a fire, preserve the tradition of the site of the ancient cloisters of the days when the Temple was still a monastic or semi-monastic establishment. Twelve etchings from Mr. Percy Thomas's needle will complete the work, which is sumptuously printed on thick paper of large folio form and accompanied by descriptive letterpress contributed by Canon Ainger, Master of the Temple.

DUBLIN has got a new explanatory title. It has become "the electric trammiest capital in Europe." The peculiarities of the city have marked it out for this destiny. Its wide stately streets, more like boulevards or the "avenues" that radiate from the Arc de l'Etoile, permit of the double rows of poles necessary for the electric installation, and the sparseness of the traffic prevents the cars being a trouble or an obstruction. The whole city

is now reticulated by these wires, and there is connection from each part with every other, and from all with the suburbs. Foreign cities like Havre and Rouen have the same system, but to no such completeness. The gain is great in comfort, speed, and economy.

FOR some time the spire of St. Ann's Church, Newcastle, has been in a threatening condition, owing to the effect of severe high winds during the last two years. The Corporation authorities have formally drawn the attention of the vicar and churchwardens to its state as a public danger, and strongly urged the great necessity of undertaking the immediate restoration of the spire. Some of the external stonework is decayed by the action of the weather, and must be renewed; and there are numerous openings between the courses of the masonry, from which the lime has completely disappeared. The spire itself has a most ominous and apparent list to the south-east. Though at present there is no immediate peril, still there is considerable risk from the winter storms, owing to the slender proportions and the great elevation of the tower, and it is felt that it would not be safe to leave it in its present state during another winter. The vicar and churchwardens have sought the advice of Mr. W. S. Hicks (of the firm of Messrs. Hicks and Charlewood), and he strongly presses the importance of having the spire taken down and rebuilt in a thoroughly substantial manner. The estimated cost of doing this is about £250, and may possibly exceed this. In order to execute this work the church authorities are appealing for funds. St. Ann's Church was built in 1768 to replace one of very ancient foundation, the date of whose erection is lost in the mists of time. The Corporation of that day rendered valuable assistance by giving for its construction part of the stone which was removed from the city wall that then ran along the Quayside.

GLOVER'S ISLAND, opposite Petersham meadows, failed to find a purchaser when it was put up to auction at Tokenhouse Yard the other day. As an inevitable preliminary to the sale came the speech of the auctioneer, who combines in his person the mayoralty of Richmond and the headship of an important firm dealing in landed estate. Mr. Chancellor at once proceeded to outline the attractions of Glover's Island, remarking that from the attention the property had received from the newspapers, it must possess extraordinary interest. Unquestionably, the island was situated in a classic locality, which had gained the attention of British painters and British poets long before public appreciation of the beautiful had attained to its present high pitch. Mr. Glover, the owner, had it was explained, purchased the property, which bears his name, some twenty-six or twenty-seven years ago, and had expended a considerable sum in restoring the island to its original limits, and in "camp-shedding" it, under the sanction of the Thames Conservancy. Various erections had also been put up for the purposes of boat-building and boat storage.

THE Glasgow Architectural Association held its opening meeting of the winter session on Tuesday week. Mr. Geo. S. Hill, President, delivered his inaugural address on "Architectural Tradition and Precedent." The distinction implied between the terms was gone into closely and clearly, noting that the acquaintance of history of any particular branch of work was invaluable for many reasons, but at all times the element important to us, which is entirely absent from the past, was the present and all that it implies. Every young designer was advised to obtain a clear and articulate idea of the position held by these great factors, as by their aid the superficial attractions of quaintness and eccentricity can be evaded when his hand can be laid upon what he knows infallibly to be good. It requires but a lively, if not over-refined, fancy to impart to present conditions a clothing never before represented. This is all what much of the modern work has to depend upon; in it oftentimes lies something analogous to the abnormal, the freak in nature, which is

never pleasing. The rationale of such Architecture is in the designers themselves, and they themselves are the only Court of Appeal by which it might be judged, taking refuge from outside criticism behind the assertion "But you do not understand." Mr Hill pointed out that the great epoch-making features and characteristic forms were not the outcome of any feverish desire for something new, but came by the pressure of their own manifest advantages, and concluded his address with the truism, "That to advance wisely we must refresh ourselves liberally from the past."

THERE has been recently unveiled a monument to the memory of the Russian Marshal Suvarof at a spot in the gap of Uri Mar where he defeated the French under Jourdan, in 1799. The total cost of the monument has been nearly £30,000, all of which has been defrayed by Prince Galitzin, Governor of Moscow. The monument has been placed in a niche about 90ft. above the famous Devil's Bridge over the Reuss. It consists of a Greek cross 40ft. high placed on a pedestal 26ft. in height cut out of the solid rock. On the latter is this inscription in Russian:—"To the valiant companions in arms of General Field-Marshal Prince Suvarof Rimnitski, Count Italiski."

A DECIDEDLY original treatment of a plaster-cast of a familiar classical group, the Laocoon, is to be seen in a villa front garden in the Forest Gate district. The father has been tinted a bright blue, the two sons are green, while both serpents are scarlet, with here and there a mottling of black. The other evening a practical joker got over the railing and placed a battered hat on the head of each of the figures. Forest Gate is nothing if not classical.

BUSINESS at Tokenhouse Yard during the past few days has worn a much brighter aspect, and there is every promise that the well-known centre will soon resume its usual activity. Although nothing of a high-class character was offered, there was a keen demand for small investments. Ten leasehold residences off the main Highgate Road, sold by direction of the trustees of the late Mr. Goodall, the well-known playing-card manufacturer, realised extraordinary prices. A freehold in Cowcross Street, E.C., producing an income of £188, was sold for £3000. The week's total, amounting to £37,100, may be regarded as very satisfactory, and it compares well with that for the corresponding week in last year, £25,170. The important riverside property known as the Bolney estate, of over 1700 acres, with a frontage to the Thames extending from Henley to Shiplake, has been sold privately for £50,000.

VAUXHALL BRIDGE is at length disappearing after an existence of a little over eighty years. Messrs. Pethwick Brothers, of Plymouth, have contracted for its removal, and they have been engaged upon it now for about three weeks. The footways are all torn up, and already so much of the roadway has been removed as to show great gaps through to the river below. The whole bridge is now one dreary Sahara of draught and dust, and something like three or four thousand cartloads of material have to be carted off wherever it is possible to dispose of it. It is expected that the whole structure will have disappeared in about nine months from the present time.

LITTLE more than £1000 is still required by the Golder's Hall Acquisition Committee to complete the purchase of the estate, so as to enable it to be handed over to the London County Council. Some £40,000 has already been subscribed or promised, and the Committee hope that the small sum now required will be raised without any further appeal to the public. The Hampstead Vestry has instructed its Tree and Open Spaces Committee to consider what suggestions should be made to the County Council as to the use to be made of the house, in accordance with the Council's resolution not to do anything with it unless by the sanction of the Vestry.

A LARGE gathering of that section of the Art world whose interests are concerned with the teaching of various branches of design assembled on Thursday afternoon in the hall of the Bermondsey Settlement in Farncombe Street, S.E., to view an exhibition which is of importance in its way. It consists of work done in the London Board Schools of the Southwark division, a locality wherein a faculty for artistic invention and an intelligent handicraft seem particularly rife in spite of somewhat depressing surroundings. The free use of the brush, both for primitive and more advanced efforts, has been encouraged with astonishing results in combinations of line and colour, and even very small pupils are almost bound to bring out any inventive instinct that is in them. The rapidity of the method is an attraction to the juvenile mind, though of course it may have its dangers for those who wish to obtain all knowledge and manipulative skill by the shortest road. It is satisfactory, however, to note that the higher grade students who are able to study closely from natural objects—flowers, leaves, &c.—produce some thoroughly artistic work fit to hold its own in any decorative display. A large number of specimens, not only of drawing and painting, but of modelling, wood carving, and metal design, have been selected to be shown at the Paris Exhibition.

A "LONDONER," writing under date of a week ago, observes:—"The ways of those who have to deal with our streets are certainly past finding out. Having had the Strand 'up' for three weeks, necessitating the disorganisation of the traffic between Charing Cross and Norfolk Street, the average mortal would suppose that between those two points at least there would be no necessity within a couple of weeks to interfere with the roadway. Therein, as usual, the average mortal would be wrong. For the past two or three days the traffic of the Strand has been congested, the roadway having been taken 'up' in the lower part of Wellington Street, on the south of the Strand just above Lancaster Place; while a little farther east, by Catherine Street, the road has also been 'up,' and is indeed at the present time, while probably because it is only a small piece, and therefore could be finished rapidly by working at night, this course has not been deemed necessary."

THROUGH the generosity of Colonel R. F. Waldo-Sibthorp the South Kensington Museum has recently become possessed of a large collection of silversmiths' work, chiefly German, ranging in date from the sixteenth century to the present time. These specimens are very varied in form, and include tankards, flagons, beakers, and salvers, decorated in *repoussé* and by engraving with flowers, scroll-work, and figure subjects; there is also a considerable collection of spoons. Among the pieces of historical interest is a standing cup and cover, surmounted by a bust of Gustavus Adolphus, King of Sweden, and with an inscription in his honour. There are a number of specimens of the work of English silversmiths, the most important being two Communion cups of Queen Elizabeth's reign, one of which retains its paten-cover. The series of English spoons covers a considerable period of time; they are interesting on account of the hall-marks, the decoration of the handles, and the shapes of the bowls. The handles of some terminate in figures of Apostles, others are seal-topped, whilst others are of the plain "sleppe endyd" form. A set of teaspoons in the form of shells, with dolphin handles, formerly belonged to Lord Nelson. Colonel Waldo-Sibthorp has included in his gift a small collection of snuff-boxes of the last century, two of which are specially deserving of notice—the first is of tinted gold set with diamonds and other jewels; the second is of enamel, and has inside the lid a portrait of Peter the Great painted by Crodowiczky.

OWING to recent changes, Holy Trinity, Minorities, has ceased to be a parish, and will be united to St. Botolph's. It may be well to remember that the church, which will thus undergo transformation into a mere parish

room, has a long and distinguished history. Originally the chapel of the Abbey of St. Clare, which was founded in 1293 by Blanche d'Artois, Queen of Navarre, the church was known by its present name as far back as 1563, some twenty-five years after Lady Elizabeth Savage had surrendered the abbey to Henry VIII. Among its plate are a pair of flagons presented by "Honest Will Legge," the cavalier who was given the Abbey Buildings for his loyalty, and lies buried in the church.

THE "authorities" have been playing a new game on the approaches to Waterloo Bridge. At the north end a kind of obstacle race and driving competition has been arranged for omnibus drivers by prolonging a tongue of "up" road into the middle of the thoroughfare. The game consists in compelling drivers going east and west to see how near they can go to each other without carrying off the buttons of the policeman who regulates the traffic. At the south end of the bridge half the roadway is "up," and the authorities are building a commodious wooden house upon it. Popular belief inclines to the theory that they propose to let it by the year as a "house on the river" pending repairs of the road.

AFTER being closed for a period of over two years, the Church of St. Mildred, Bread Street, is now within measurable distance of being reopened. The interior of the structure, which was completed by Wren in 1683, now presents a pleasing appearance. Unlike most London churches, it is capped with a large and enriched dome, the ornamental plaster-work being of the most tasteful design. To Grinling Gibbons, one of Wren's pupils, is attributed the beautiful carving of the pulpit, which is in a splendid state of preservation. Conspicuous in the centre of the nave is the Lord Mayor's pew, with its civic emblems, while overhead are suspended the massive chandeliers now fitted with electric light. The aisles have been laid in marble, and air pipes have been fitted in the centre of the herring-bone flooring of the pews. The cost of the alterations has been estimated at £1000, the work having been carried out by Messrs. Dove Brothers, of Studd Street, Islington.

MR. J. H. BALDOCK writes to the Times:—"Being at Darenth on Saturday last for the purpose of obtaining some photographs of the old Roman villa, I was informed that the remains of the villa would be shortly covered up again, and that corn probably would again grow on the site. I should like to suggest, therefore, that those among your readers who are interested in the matter should lose no time in seeing this important archaeological discovery ere it is too late. Farningham Road, on the London, Chatham, and Dover Railway, is the station to go to."

THE ancient and lovely Weald Common at Harrow is about to be protected from the assaults of unscrupulous vandals. In framing a scheme to carry out this object no small difficulty was encountered. The common was under the control of so many authorities, all apparently in conflict with each other, that for a long time it seemed as if their passive indifference would resolve itself into absolute neglect. Harrow Weald Common was given to the people of the parishes of Harrow, Wealdstone, Wembley, Harrow Weald, and Pinner in order that they might provide themselves with gravel, which was to be found there in abundance. Further, of course, the parishioners were given the right to enjoy for ever the manifold natural beauties of the common. Of late years the common, which covers a very large area and is 500ft. above the sea level, has fallen on evil times. At last, however, there is a probability that the common will shortly be placed under one responsible controlling authority. Several residents in the vicinity of the common have subscribed sufficient money for the purpose of enabling a body of conservators to be appointed with the object of preserving the common and improving its natural beauties. A scheme has been drafted, and it is hoped it will be confirmed by Act of Parliament.

A CERTAIN degree of indiscretion attaches to Sir John Donnelly's attempt to defend himself, and the Science and Art Department that he represents, by writing explanations to *The Times*. So says the *Globe*. He only, in our contemporary's opinion, revives unpleasant scandals, and affords to the many opponents of his administration useful opportunities of making more emphatic the indictment of the Department. Mr. Spielmann, for instance, writes a rejoinder to Sir John that is definite enough, and disposes satisfactorily of the official platitudes. Most people would be better pleased to see the chiefs of the Department prepared to accept and carry out loyally the recommendations of the Select Committee. After all, the South Kensington Museum has been created and maintained at great expense for educational purposes, and everything that increases its efficiency in this direction is worthy of support. Continued opposition on the part of the officials to reasonable reform is extremely foolish, and must have, ultimately, results most unpleasant to them.

THE Poet Laureate has unveiled at Whitby a cross which has been erected to the memory of Caedmon, the first English poet. Twelve hundred years ago, Caedmon, a simple cowherd attached to the Abbey of Whitby, composed the Hymn of the Creation, the first great song of an English poet. An Anglican cross, designed after the great contemporary crosses of Bewcastle, Ruthwell, Rothbury, and Hexham, on the Abbey Cliff, has been chosen as the most appropriate memorial. The cross is of fine-grained hard sandstone, and is 20ft. in height, standing on a solid base of stone. On the front of the cross are four panels representing Christ in the act of blessing, David playing a harp, the Abbess Hild, and Caedmon in a stable composing his great song. The three other sides of the cross are decorated with figures and designs. The first nine lines of the Hymn of the Creation have been carefully translated by Anglo-Saxon Professors at Oxford and Cambridge. These lines, in English and Runic characters, are carved upon the back and sides of the cross.

THE Wesley Museum, of which so much was heard in the early part of the year, is to be opened on Thursday, November 10th. Wesley's old house, which, as every Londoner knows, or should know, adjoins the handsome chapel in the City Road. The house, which possesses no architectural features of distinction, but is an ordinary and very severely-built red brick building, is of some age, and was for many years the residence of Wesley. A sum of over £1000 has been spent on its restoration, and of this amount close upon £500 has had to be laid out in strengthening the foundations, which were in an advanced state of decay, the house having been originally erected on a swamp. The three rooms on the first floor have been set apart for the purposes of the museum, and have been entirely renovated.

THE Leadenhall Press has just issued a facsimile of a work published in 1615, one of whose copies is now worth its weight in gold. The title of the book runs as follows:—"A Rooke of Sundry Draughtes, principally serving for glasier, and not impertinent for plasterers and gardeners, besides sundry other professions." It was printed "by Walter Dight in Shoolane, at the signe of the Faulcon." Even the British Museum is without an original copy of this work, which has become the text-book on the subject of decorated drawings for leaded glass. The volume from which the Leadenhall Press has made the facsimile came from the celebrated library of the Earl of Ashburnham, recently dispersed at Messrs. Sotheby's sale rooms. Quaint features of the book are the old parchment binding and leather thongs, also facsimiled from the original volume. The price is 6s.

THERE has been unveiled and dedicated at Broadhempston Church a new east window. The subject of the window, which is a three-light one, is the Resurrection; and in the centre light is the figure of our Lord rising

from the tomb holding the rod of triumphant victory. At His feet are roses and the crown of thorns, and on the right hand, seen in the distance, are the three Marys approaching the sepulchre, bringing the spices, &c. Below there is a sleeping guard, with a marvellously-brilliant maroon cloak lined with rich gold, helmet, and armour, sitting on the grass; and at the left, opposite to the slumbering soldier, are two others with similar accoutrements, one with startled expression, evidently wondering at the sight he beholds. Above him is a beautiful angel, with his hand upon the up-lifted stone, watching the rising Saviour. The adoring angels were depicted in the tracery at the top, and in the apex was the sacred monogram. The window is a most magnificent one, and is a splendid acquisition to the recently-restored grand old building.

THE first theatre in London to adopt electrical power to assist in the construction of elaborate scenes in the manner advocated by Mr. Edwin O. Sachs is the Theatre Royal, Drury Lane. Mr. Sachs, who holds the commission, has, to begin with, been entrusted with the arrangement for moving some large sections of the stage floor—each measuring 10ft. by 7ft.—to any level above or below the footlights, every movement to be easily controllable from an ordinary switchboard. This improvement will be completed for the impending pantomime. The contractors are the Thames Ironworks, whose civil engineering and electrical department are excelling themselves in the rapidity of execution under the most difficult circumstances, as will be seen from the fact that the whole of the heavy constructional work had to be carried out whilst such an elaborate play as the "Great Ruby" was in rehearsal, the rehearsing being done on temporary stage flooring, and shifts of men working turn by turn day and night. As regards the system of construction adopted, those of the suspended electrical lift have been applied, but in such a manner that the appliances will be a great improvement on what has been so far done on the Continent. The material is steel throughout, except for the stage floor proper. It is a matter of particular congratulation that the so-called National Theatre should have led the way in the matter, and all credit is due to Mr. Arthur Collins and his co-directors for having met the conservatism and prejudice so common to the stage with improvements more in keeping with this modern age of invention.

AFTER being closed for nearly three weeks, St. Nicholas Cathedral, Newcastle, has been reopened. The whole church has been thoroughly cleaned from roof to floor, the dust and dirt which had accumulated upon the beautiful reredos, the carved oak work, and the many handsome monuments has been removed, the arches in the choir, which were blackened by the gas, have been cleaned, and a complete installation of the electric light is being put in by Messrs. Barnett, electrical engineers, Newcastle, which promises to show off the fine proportions of the grand old building to great advantage, as well as giving much less heat, and tending to greater cleanliness.

THE collection of pictures forming the eleventh exhibition of oil paintings and watercolours promoted by the Dudley Art Gallery Committee, must, from a purely artistic point of view, be regarded as the best that has ever been seen within the borough. The collection consists of 130 oil paintings and about fifty watercolours, &c., nearly all of which are by living artists. The place of honour is accorded a large painting by John R. Reid, entitled "A-hunting We Will Go," which, in vivid colours, characteristic of the artist, represents a bright November morning, and a typical country family hastening with all speed from an old-fashioned cottage to catch a glimpse of the huntsmen and hounds as they career across the fields in the distance. Near to this admirable study is a clever work, "An Interior at Murano," by W. Logsdail, which is a triumph of the painter's art, in the equalities of artistic design and exquisite colouration. In a metal manufacturing dis-

trict like this the subject and the peculiar shades of W. H. Y. Titcomb's picture, "Making of Steel by the Bessemer Process," will appeal strongly to the imagination of visitors. "The Evening of Life," by Flora M. Reid, representing a peaceful country village scene, with an old lady being led by a young one for its central figures, is a work of much technical excellency, refinement, and pathos. The picture which will probably attract the most attention is S. Melton Fisher's "Vanity Fair," in which the play of colour is infinitely varied, rich, and fine; whilst the contours of figures of the handsome and fashionable ladies, and the animation on their countenances as they inspect the beautiful materials offered for their personal adornment, are introduced with rare skill.

THE well-known Academy picture, "My Crown and Sceptre," by T. C. Gotch, which has also been exhibited on the Continent, cannot fail to impress visitors with its wonderful technique. Mr. E. Hayes sends a fine picture, and one which the committee would like to acquire, representing French fishing boats leaving Boulogne Harbour. "Eve," a study in the nude, by Mary R. Raphael, which has been exhibited at the Academy and recently at the Paris Salon, is a clever and interesting work. Other pictures worthy of special mention are: "Jeanie, Jeanie, save me," taken from the trial scene of the "Heart of Midlothian," by Florence Small; "The Placid Stream," by Ernest Parton; "Portrait of a Lady in White," by Mary F. Raphael; "Tired Out," by T. Hartland Fisher; "A Hollow in the Downs," by J. Aumonier; "A Scribe in the Door of the Mosque, Tangier," by A. Mann; "Autumn," by D. Farquaharson; "Tending Turkeys," by Arthur Meade; "Birds of a Feather," by W. H. Longmaid; "A Circus Starting to Parade the Town," by C. J. Adams; "Satan Finds some Mischief still for Idle Hands to Do," by J. C. Dolman.

PETRARCH and Laura de Noves have rendered famous for ever the fountain of Vaucluse, which, with the swift Sorgues, has also been immortalised in verse by a modern English poet. Lovers of the picturesque past of the place will be sorry to hear that the utilitarian engineers of the French Government are about to tamper with the fountain by order of the Minister of Agriculture. The officials of the hydraulic service of the department of Vaucluse, or some of them, are under the impression that the fountain can give out a fuller supply of water than that now available. According to M. Dyrion, chief engineer of the district, the fountain, which is in a chalky bed, is surrounded by internal caverns of vast dimensions, where water accumulates during the rainy season, and which thus act as reservoirs. Another authority, however, M. Pochet, believes that the calcareous mass is like a wet sponge, which empties water through fissures during the summer. Experiments are now to be made for the purpose of ascertaining, if possible, the exact condition and capabilities of the interior of the fountain, or rather of the rocks from which its waters spring and form that tributary of the Rhône known as the Sorgues. This being the case, it is certain that for some time to come at least the fountain which is associated with so many historical and literary recollections will be disfigured. The works to be undertaken at the bidding of the Minister of Agriculture are, however, necessary in the interest of the inhabitants of the district. The fountain has given out a limited quantity of water during the recent summer, which was, of course, fiercely hot in the south at times, and occasioned serious droughts.

MR. WILLIAM WILSON, M.I.C.E., the famous railway engineer, has just died at his residence in Kensington, in his seventy-seventh year. In early life the deceased gentleman was associated with George Stevenson. He first suggested the advisability and practicability of bringing the Southern Railway lines across the Thames, resulting in the construction of the now world-famous Victoria Station, as well as the Victoria Railway Bridge over the river,

which, in conjunction with Mr. (now Sir) John Fowler, he built in 1859-60, the station being erected on the site of the old Grosvenor Basin. He it was, too, who named the station, and, consequently, the street and district; for, at a meeting at the house of the Marquis of Westminster to determine on a name for the station, Mr. Cubitt wanted it to be called "Pimlico," while the Marquis wished it to be called "Grosvenor," but Mr. Wilson said, "Why not call it Victoria, after the Queen?" and that name was adopted. Other works for which Mr. Wilson was responsible were the first Metropolitan Railway, of which he did the pioneer work, and prepared the estimates; the Millwall Docks, of which he was the originator, although his original plan was not carried out in its entirety; the Hammersmith and City Railway, the West London Extension, the Aylesbury and Buckingham Railway, the Banbury and Cheltenham Direct Railway, Neath Harbour Works and Docks, and Jenez and Algericos Railway. He was also connected with the erection of Euston Station, and with many important railway and other engineering enterprises in all parts of the world.

THERE appear to be many difficulties in the path of the committee of the Monmouthshire County Council, who were appointed to inquire into the proposed acquisition of Tintern Abbey and Raglan Castle, on the Marquis of Worcester's estate. The council has no power to buy unless it be conferred upon them by Act of Parliament, and then, probably, it would only be obtained after some public-spirited person had first of all effected the purchase. There is, however, the difficulty of arriving at an estimate as to the true value of the places, which have a commercial and an historical value. As regards the commercial estimate, it is stated that Tintern, as a sight-seeing resort, has produced an average of about £700 or £800 a year, and Raglan about £500. The historical value, however, would vary with different persons. It has been suggested that private persons of means, or the National Society for the Preservation of Ancient Monuments, should come to terms with the vendor, and vest the buildings in the council or local trustees. There is, however, no fear whatever that the Marquis of Worcester will accept the offer of any one in the way of an enterprising showman.

THAT dingy corner of central London known as Southampton Buildings is at present undergoing extensive alterations, and the Patent Office—that repository of many lost hopes and unfulfilled schemes—is closed for much-needed extensions. The inventor is a sanguine person, as any one of the many patent agents who abound in the neighbourhood of Chancery Lane can bear witness, and here have been accumulating for years past hundreds of thousands of specifications of patented inventions that, in the belief of their authors, were to revolutionise the industries of the world. The percentage of patented devices that have brought fortunes to their originators must, however, be a very small one, and between the capitalist on the one hand, who generally exploits the usually impecunious inventor, and the commercially unsuccessful patents themselves, the inventive genius generally finds in the long run that the comparatively stupid person who pursues fortune on the old lines has the best of it. How difficult it would be to rub these facts in may be judged from the facts that inventors have been numerous enough and sanguine enough to fill seven miles of shelves with their specifications, and that more room is urgently needed for the stream of new ones, which shows no sign of decreasing. These documents are temporarily housed in Chichester Rents, on the other side of Chancery Lane, adjoining tenements made famous by Dickens in "Bleak House."

Good progress is being made with the mural decorations which are converting the ambulatory portion of the Royal Exchange into a beautiful picture gallery. There are twenty-four niches in all to be filled with paintings, and of these five have been already filled, two

are being prepared for the artists, and eight have been bespoken, leaving nine places to be yet taken up by citizens of companies of public spirit. Four of the five paintings executed are the gift of a private gentleman, the fifth is the gift of the Corporation, and one of the promised paintings will be given by the Sun Fire Insurance Company. Two of the five completed pictures have scarcely received their finishing touches, and are not yet unveiled.

FOR some little time past the Greek Archaeological Society has been excavating in the neighbourhood of Thermon, the place of assembly for the ancient Ætolians. Professor Sotiarides, a distinguished scholar who is in charge of the operations, informs the Standard's correspondent that the Temple of Apollo, which has recently been discovered, dates apparently from the seventh century B.C. It is built on a cemetery, where may still be seen the bones and ashes of the dead, preserved in large vases of earthenware. Five iron and copper swords and two buckles were also found in the large field which contains the cemetery and temple. The foundations of the temple indicate, the Professor says, that it pointed due north and south, like the ancient temples of the Etruscans in Italy. The sacred enclosure was divided into two galleries by six wooden columns, of which the bases are still preserved. The temple was 38 metres in length and 12 metres in breadth. Of the twenty marble columns which went round it, the bases and various parts are preserved. Several heads, beautifully modelled in clay, and coloured, stood on the cornice of the temple. Inscriptions, some giving the decrees of the Ætolian Assembly, have also been found, and are of exceptional interest.

THE Art Museum at South Kensington has recently acquired several designs by the late Sir Edward Burne-Jones. Among the more important are "The Tree of Life," for a mosaic in the American Episcopal Church of St. Paul in Rome; "The Nativity" and "The Crucifixion," for stained-glass windows in St. Philip's Church, Birmingham; and "The Four Evangelists," for a stained-glass window of Castle Howard. Besides these drawings of Burne-Jones, the Department have obtained two tapestries woven at Messrs. Morris and Co.'s works at Merton Abbey—"Angeli Laudantes," designed by the same master, and "The Orchard," designed by the late William Morris; also a cartoon for tapestry, "The Goose Girl," by Walter Crane.

THE Photographic Salon, which exists especially to show the latest developments in what may be called fanciful photography, opened at the Dudley Gallery last week its sixth annual exhibition; and at the beginning of this week another of the autumn shows, that at the New Gallery, was opened. This consists of works of Art by living French artists, and of a collection of pictures and artistic objects lent by Signor Bordini, of Florence.

THE Cherche Midi Prison, in which Colonel Picquart is now so closely confined that even his counsel is not allowed to visit him, has many historical associations. It was built in the eighteenth century by the architect Victor Dailly for the Countess de Verue, whose salon was famous in the days of Louis XIV. At a later period it was the residence of Madame Récamier, when it became the rendezvous of the most famous French men and women—Lucien Bonaparte, Bernadotte, afterwards King of Sweden, Madame de Staël, the Queen of Naples, the Duchess D'Abrantes, and a host of others. Now-a-days the building is much changed internally. It is a military prison fitted up with cells, from a refractory cell of bare plaster without furniture to the officers' cells, such as that at present occupied by Colonel Picquart, which is provided only with a rush-bottomed chair, a deal table, and a little narrow iron bedstead with bedding. The famous pictures collected by the original owner were long ago dispersed, and the walls are bare of anything like ornaments, save official regulations and notices.

ARCHÆOLOGISTS AFIELD.

VI.—IN THE ISLE OF MAN.

THE Isle of Man Natural History and Antiquarian Society during a recent tour in the island came upon much of archaeological interest—Rushen Abbey in particular. On the way to the abbey the leader pointed to a small house at the corner formed by the two roads leading to the entrance gates to the hotel. An arch could be traced in the gable, the date of which he put at 1300-1400 A.D.; the building was used as the Abbey Court-house. Permission having been courteously granted by the manageress to go over the grounds, the party proceeded to inspect the tower behind the hotel. This appeared to have been placed at the south end of the Cistercian Church, which ran north and south, having an aisle on its western side, divided from the nave by an arcade of four or more arches. From inside the tower one could see a perfect arch remaining, formed of twenty-six blocks of a yellowish sandstone having a plain chamfer. It measured 8ft. 6in. across, and 4ft. high in the centre. A wall, possibly of older date, runs from the S.E. corner of the tower due E. In this was a rectangular window, recently reopened, the lintel formed of two blocks of stone, roughly fitted near the centre. It measured 3ft. 10½in. high, and 1ft. 7in. wide at the sill, tapering by 2in. to the top. The splay was on the south side. The leader pointed out the tower at the old road as the ancient and only entrance to the abbey, which on the east would be well defended by the river, doubtless in those days much deeper and at a lower level than now. An indication of its level appeared in the Refectory, which was next visited. Here the tops of the window could be seen almost on the level of the present floor. Proceeding to Castletown, the Grammar School—formerly the Church of St. Mary—was visited. Here the leader pointed out three arches which appeared to be in every respect similar to those at the Abbey. The measurements were the same; the material was identical; and they bore the same simple chamfer. He argued that, after the dissolution, these arches had been removed and utilised in the building of the present structure. It was suggested that these arches did not necessarily imply an aisle here, as they might possibly have been brought and built into the walls in order to preserve them from desecration. The three arches as now standing measured 31ft.; if this were added to the remaining one, and the portion of one still in the tower at the Abbey, it would give a length for the Cistercian Church of at least 40ft. It was stated that graves were said to have been found around the Grammar School, but it was pointed out that it stood upon solid rock.

LORNE HOUSE.

The grounds of Lorne House were visited. On the edge of an abrupt bank close to the old road which separated the Abbey Lands from the Lord's Lands, slight traces as of a moat could be distinguished. This, on the Ordnance Map, is marked "Site of chapel and burial ground;" and the caretaker said he had heard of skulls and other bones being found in the enclosure when the surface was levelled in 1825, and had always heard it spoken of as a chapel and graveyard—the stones being supposed to have been built into the present barn. The leader pointed out how admirably it was situated for a defensive position, for which purpose it might possibly have once been utilised.

CASTLE RUSHEN.

Proceeding to Castle Rushen, some time was spent in examining the underground vaults, which, it was suggested, were probably on the site of the oldest castle or fortified post erected here. One looked almost as if it had been a water gate to the present castle. It would have been easy, before the moat had been filled up, to have entered from the river right into the surrounding moat. The keep was thought to be more likely late than early—perhaps fifteenth century.

HOLLOW WALL CONSTRUCTION.

WE give, on this page, sketches illustrative of this subject and supplementary to those which appeared in our issue of a fortnight ago. The sketches fairly explain themselves, but in forwarding them Mr. G. A. Kenney writes:—

"I may say that for good bond in brickwork I consider that in every case the work should be set out so that the cross joints of each course of brickwork should be straight through the thickness of the walls, wherever possible, as shown in the accompanying sketches of plans. In every case of hollow walls, the cavity should be well and properly ventilated by 9in. x 3in. close mesh air bricks, just above the ground level and under the eaves, as shown in Figs. 1 and 6; and the under part of the ground floor should also be well ventilated by a number of 9in. x 3in. flues or openings in the inner 9in. wall, below the bold level, through to the cavity in wall, but not opposite to the air brick in the outside wall (see Fig. 7)."

"The window sills should be the required width so as to have a bearing of not less than 1½in. on the inner 9in. wall (see Fig. 2). The wood lintels to all door and window heads should be the width required so as to come up to back of external arch (see Fig. 3) and the cavity between the inner 9in. wall and arch filled up with cement and sand, half of each, and the top hollowed out or channelled to form gutter, and fall to each end of wood lintel from centre, as shown by dotted lines in Fig. 4, and the crosses in same indicate the position of the wall ties, as also in Fig. 9. The reveals and jambs of all doors and windows should be built solid in cement and sand, one to two, as both adds to the strength of the wall where most required. Particularly door jambs and the cross joints, filled full, prevent the damp getting through by reason of the work being solid. Also there should be extra ties to all openings (see Fig. 4)."

"Fig. 12 is plan of 4-flued chimney, 14in. by

9in. each, and Fig. 13 is plan of course above and below Fig. 12, which show the chimney well bonded together in every way with the cross joints, straight through each way also."

KEYSTONES.

HER Royal Highness Princess Christian of Schleswig-Holstein has consented to open the Artists' Guild Tenth Amateur Art Exhibition, at the Imperial Institute, on November 7th.

THE collection in the Louvre has been lately enriched by the addition of an important canvas, a "Virgin and Child," by Piero della Francesca. The figures are life-size, and are set against a landscape background. The picture was formerly in the Tremoille collection, and has been acquired by the authorities of the Louvre at the cost of £5200.

ABERGELDIE CASTLE, which is the principal Royal residence on Deeside after Balmoral, is a fine old mansion in the Scottish baronial style, between Balmoral and Ballater. The whole estate of Abergeldie (which includes the celebrated deer forest of Whitemouth) has been leased for many years by the Queen from Mr. Gordon.

TRAVELLERS on the railway line from London to Brighton and Redhill cannot fail to have noticed the handsome red-brick building half hidden by trees, on the summit of a hill on the right hand, shortly after leaving Croydon. This is the Russell Hill, or, to be more precise, the Warehousemen, Clerks' and Drapers' Schools. A new wing has been added. The new building, which is connected with the main structure by a range of cloisters, has eight class-rooms. The architects are Messrs. Kingwell Cole and Kenneth Wood. The style of the building is late Scholastic Gothic. The woodwork of the roof is of sequoia, and all the floors are fireproof. Ventilation and heating apparatus are by Messrs. Rosser and Russell. It is estimated that the total cost amounts to something like £9000.

BRIDGE BUILDING.

THE INTRODUCTION OF IRON.

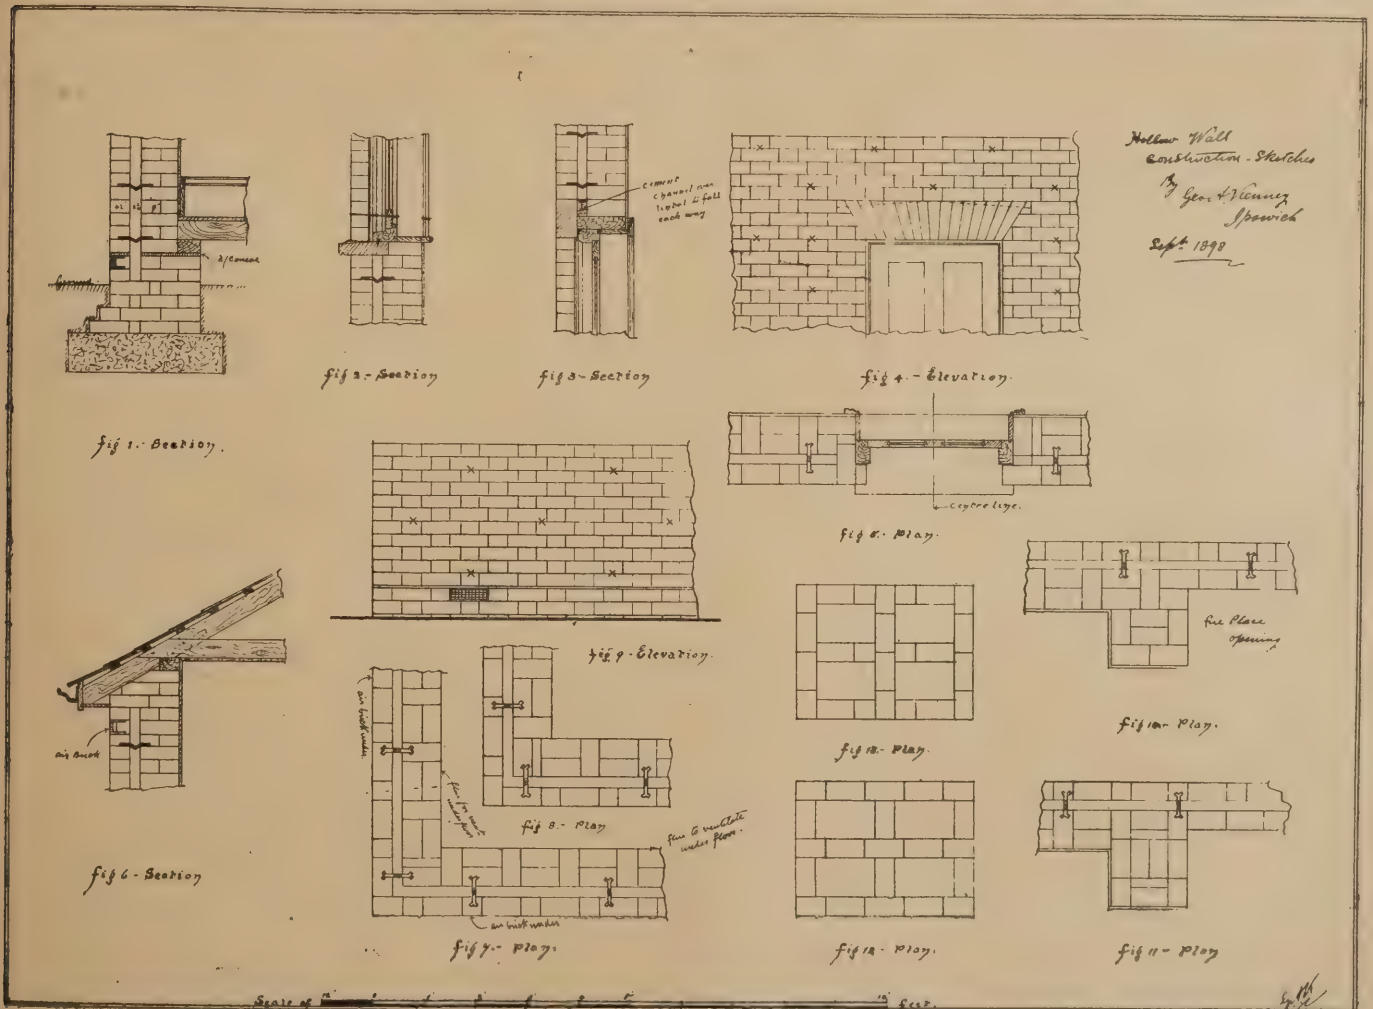

IT was Locke who said that "he who first made known the use of iron may be styled the father of arts and the author of plenty." Prior to the close of the eighteenth century, bridge building, where any engineering skill might be required, was in its infancy; rickety wooden structures affected by wind and rain, or

CLUMSY STONE STRUCTURES

impeding the flow of the water, being the order of the day. It was John Wilkinson, the famous Shropshire ironmaster, who first conceived that his favourite metal might be employed for the purpose; but the idea was pronounced to be ridiculous, and Wilkinson himself termed "iron mad." Perhaps the latter accusation is hardly to be wondered at, when we read that this eccentric manufacturer built iron pulpits, and kept iron coffins of various sizes scattered about his garden, from which his friends were encouraged to take their pick gratis! It is only fair to state, however, that though Wilkinson's idea was a novel one in this country, both French and Italian engineers had already made attempts in the same direction, but had failed, owing to their inability to cast large masses of metal. The

FIRST ATTEMPT AT AN IRON BRIDGE

had been carried out about 1757 at Lyons, and one of the arches was put together; but the project was then abandoned as too costly, timber being substituted in its stead. How the scheme was carried to a successful issue over here, and how the art of bridge building became in consequence revolutionised, may be told as follows:—In 1775 the Coalbrookdale ironmasters, with Wilkinson at their head, says the Engineer, formed the project of making a bridge of cast-iron, to supersede a boat ferry across the Severn, near the village of Broseley, the expense to be defrayed by a joint stock company. The plan the architect

HOLLOW WALL CONSTRUCTION,

suggested was to use part stone and part iron, iron only being brought in to form a crown to the arch. But Wilkinson insisted upon a fabric composed of iron throughout, and, as he was the largest shareholder, his influence gained the day. In 1777 the stone abutments were laid whilst the castings were being prepared at the neighbouring works; and on the ironwork being completed two years later, the erection of the bridge itself only occupied three months.

THE EARLY IRONMASTERS

and architects deserve the greatest credit for introducing this hitherto untried material for bridging, and for the manner in which they erected the great ribs, each of which consists of two pieces only, weighing nearly six tons each. The span of the semicircular arch is 100ft. 6in., and the height from the base line to the centre is 40ft. The weight of iron in the whole is 378 tons. On the largest or exterior rib is inscribed in capitals, "This bridge was cast at Coalbrookdale, and erected in the year 1779." Its convenience and importance to the district may be imagined from the fact that the town of Ironbridge was called into existence and known by that name by its erection. The projectors had been unable to disengage totally their ideas from the usual masonry arch, the form of which in iron is not graceful, nor does it offer sufficient resistance against the pressure of earth behind the abutments, which has pushed them forward, and thus raised the iron arch to a curious peak in the centre. But when first opened the bridge was found to be such an enormous improvement upon the heavy, clumsy-looking structures of stone that choked up the stream by their huge abutments, that no one was inclined to be too critical. Again, authorities like Telford and Stephenson have spoken highly of it, the latter saying: "If we consider that the manipulation of cast-iron was then completely in its infancy, a bridge of such dimensions was doubtless a bold as well as an original undertaking, and the efficiency of the details is worthy of the boldness of the conception." Somewhat late in the day, in 1792, a now very rare copper halfpenny token was issued in its honour. The medal, which has a representation of the bridge, together with the date of its erection, bears on the reverse the inclined canal plane at Ketley, a village near. This apparatus for raising barges from one reach to another, also the first of its type, had been erected in 1789. But although the first iron bridge to be constructed had been immediately hailed as an unequivocal success, nearly twenty years elapsed before the experiment was repeated. This took place in the same locality. The new bridge spanned the same river, and was cast at the same works. The old Norman bridge at Buildwas, situated two miles higher up the stream, had been swept away by an uncommonly high flood in 1795, and to Telford, the engineer of the hour, was entrusted the

DESIGNING OF A NEW BRIDGE

to be built at the expense of the country. "This," says Telford, in his autobiography, "led me to consider a new mode of bridge building, which had been introduced about twenty years before that time; but in forming the design for Buildwas Bridge, the next bridge of cast-iron, I made the arch 130ft. span; the roadway to rest on a very flat arch—the segment of a very large circle—calculated to resist the abutments if disposed to slide inwards as at Coalbrookdale, while the flat arch was itself sustained and strengthened by an outer arched rib on each side of the bridge." This bridge was cast in an admirable manner by the Coalbrookdale ironmasters, and opened for traffic in 1796. The elegant form of its structure—after the elimination of the few faults the bridge had been found to possess—was followed in the construction of the handsome iron bridge, erected in 1817, crossing the Severn at Coalport, four miles below Coalbrookdale.

The peal of four bells in Barnack Church has been rehung, after having been recast by Messrs. John Taylor and Co., of Loughborough.

A DERBYSHIRE CHURCH RESTORED.

THE OLD EDIFICE AT BOLSOVER.

THE ancient little Derbyshire town of Bolsover has just restored its parish church. The beautiful old parish church was destroyed by fire something less than two years ago. As a landmark the church has vied with the fortress-castle since Saxon times, and many vicissitudes have they passed through during that lengthy period. Bolsover was a much more important market town, comparatively, 500 years ago, when it was noted for its manufacture of steel buckles, amongst other things, than it is to-day, but centuries before that a complete stone church had supplanted a primitive erection in which the inhabitants used to worship.

THE HISTORY OF THE OLD CHURCH

is therefore full of interest, and many and strange have been the changes during the years the church has stood on the ridge of the valley it overlooks. Some parts of the early building constructed by the Saxons have been incorporated in the new building. The church building impulse, which culminated in the massive grandeur of the style known as the Anglo-Norman-Romanesque, was felt in the Derbyshire town, and the result was seen in a complete stone edifice being erected in the year 1020. This building was demolished 180 years later, and another in the style known as the Early English built in its place. This building stood for 600 years. In the year 1878 it was thoroughly restored at a cost of nearly £6000. The old 1200 chancel arch was to a large extent buried in the north wall. This, however, was restored to its proper place, and with other stones formed the beautiful chancel arch of the 1878 restoration. All that remained of the building after the fire two years ago was THE THIRTEENTH CENTURY TOWER AND SPIRE,

portions of the outside walls of the fourteenth century chancel, the Cavendish chapel erected A.D. 1618, and the north porch and parts of the outside walls of the north aisle and transept (the latter used as a vestry) which were built some twenty years ago. A movement was at once set on foot to gather funds to defray the cost of replacing the charred ruins with a new church. The Duke of Portland contributed handsomely to the fund, and so readily did the response follow the appeal that the contractor's men were soon in the churchyard preparing to carry out the work of rebuilding. Mr. Louis Ambler, London, was appointed architect, and to his designs the work was carried out. The former church provided seats for about 500 worshippers, and it was desired to increase the accommodation as much as possible, retaining the portions of the old building which were not destroyed by fire, and without adding to the length of the church. This has been accomplished by extending the south aisle laterally, about 100 additional seats being thus obtained. The north and south aisles are now of almost equal width, instead of the latter being about half the width of the aisle on the opposite side, as it was before the fire. The nave has been made 3ft. 6in. wider than the one destroyed, thus being restored to the central axis between the western tower and the chancel, as the original thirteenth century nave evidently was. A triple arrangement of roofs over the nave and aisles has been adopted, the nave arcades being carried on octagonal pillars with capitals as before. Most of the remaining portions of the building having been of the fourteenth century period, it has been considered best to build the new portions in the same style, in order to produce as far as possible a harmonious whole. The external walls are of Bolsover Moor stone, with Weldon stone for the window tracery, &c. Throughout the interior Ancaster stone has been used, the walls, which formerly were plastered, being now lined with stone; those of the tower having been repaired and pointed only. The

WOODWORK OF THE ROOFS

is chiefly pitch pine, the whole being stained palm-leaf green. The new roof of the beautiful

Cavendish Chapel is of oak, with carved beams and pendants and enriched plaster panels in the Jacobean style, and is covered with lead. While the passages are paved with "terrazze" and cube marble mosaic, under the seats wooden blocks are used. The chancel floor is of marble mosaic, with Devonshire marble steps. It may be interesting to mention that the slab stones found in various parts of the church have been relaid in the floors of the transept (vestry) and under the tower; and several ancient stone coffin lids, with incised crosses, which have been discovered, have been fixed round the base of the tower walls inside. An old piece of carving representing the Nativity (probably part of the fourteenth century altar piece) has also been preserved, and fixed to the wall inside the porch. The new carving has been modelled on that in the Chapter House at Southwell Minster. The font, which was formerly in the parish church at Chesterfield, has been presented by the vicar of that place, and

THE HANDSOME STONE PULPIT,

designed by the architect, is the gift of Major Hallows. The doors, seats, and choir stalls are of oak. The total cost of the rebuilding and restoration, with such fittings and furniture as are at present provided, is about £9000. The following are the names of the firms who have been entrusted with the work:—Contractors, Messrs. Bowman and Sons, Stamford; clerk of the works, Mr. J. C. Walker; and the organ builder, Mr. C. Lowe, Sheffield; Messrs. Bowman and Sons being responsible for the case, which was designed by the architect. The heating has been carried out by Mr. James Gray, Chelsea (hot water on the low pressure system); the recasting and rehanging of the bells by Messrs. John Taylor and Co., Loughborough; the mosaic floors have been executed by Messrs. Mainzer and Co., London; the wood block floors by Messrs. Charteris and Longley, London; the wrought iron and brass gas fittings by Mr. Geo. Wragge, Salford, Manchester; the fireproof door to the Cavendish Chapel has been supplied by Messrs. Chubb and Sons, London; the ornamental wrought iron door hinges and furniture by Messrs. Jones and Willis, London; the new clock by Messrs. Smith and Co., Derby; and the stone carving has been executed by Messrs. Tuttell and Son, of Lincoln.

A CARVED-OAK lectern, the gift of the Duke of Richmond and Gordon, has been placed in the chapel of the West Sussex Asylum.

The members of the Cardiff Corporation recently paid a visit of inspection to Cathays Park for the purpose of finally determining the sites of the new Town Hall and Law Courts. Mr. Harpur, the borough engineer, accompanied the members, explaining the sites as marked out by lines of flags, while the architect (Mr. Lanchester) also attended with the necessary sketches. As the result of the inspection the buildings will occupy the sites as shown on the plans, with the modification that they will both be placed nearer the avenue of trees. This will have the effect of removing the Law Courts a little farther away from the noise of the traffic on the North Road, and on the other side will leave a space between the site of the municipal buildings and Park Place of about 100yds., allowing room for a good 50ft. roadway and the erection of another building, probably a museum. The architects were also directed to proceed with the preparation of the working drawings, the council thus finally approving of the additions and modifications previously suggested by Mr. Lanchester, increasing the original estimated cost from approximately £198,000 to £233,000. The increase will be chiefly absorbed in the cost of giving the buildings a higher elevation, the remainder being for a few additional offices. Both the Town Hall and Law Courts will be facing Queen Street, their frontages being roughly in a line with the canal lock, separated from one another by the existing avenues of trees, and having in front an open space, bounded on the Queen Street end by the broad roadway of 60ft. or more in width, crossing from North Road to Park Place.

Professional Items.

ABERAYRON.—The formal opening of the Aberayron County School buildings has just taken place. The school is situated within its own grounds on a prominent site just above the Feathers Hotel. It is an open situation, but has a southern aspect and is sheltered from easterly winds. The architect is Mr. L. L. Banks Price, B.A., of Doldremont, Lampeter, and the contractor Mr. E. Evans, Llanybyther. The buildings consist of a fine and spacious centre hall, two class-rooms, master and mistress's room, workshop, laboratory, music room, kitchen, etc.

BIRMINGHAM.—A useful addition to the Birmingham Homœopathic Hospital buildings, in Easy Row, has just been opened. It is the first instalment of a series of extensions and improvements, for which a building fund of £4300 has been raised. It is proposed to extend the hospital itself, replacing the remainder of the old frontage in Easy Row with an elevation similar to that of the new part. The old part, which was originally a factory, will be taken down and rebuilt, with a view to completing the hospital as a thoroughly efficient institution on modern lines. For the completion and furnishing of the new buildings another £1000 will have to be raised. The portion opened is an extension of the small block at the rear. This building was originally intended for an isolation hospital, but, as the municipal authorities now deal with infectious cases, it has been utilised for a nurses' home. The extension, the building and furnishing of which have cost £700, provides five additional bedrooms and a nurses' parlour.

CARDIFF.—A new steam laundry just off Marlborough Road, on the outskirts of Roath, Cardiff, has just been opened. The laundry premises occupy rather over an acre of ground, and the whole is surrounded by a brick wall with white coping stones, surmounted by a wrought-iron railing, with substantial pillars at frequent intervals. The building has been in course of construction for some twelve months, under the supervision of Messrs. Habershon and Fawcner, who are the architects. Messrs. W. Thomas and Co., of Cardiff, secured the contract for the building. The entire cost of the buildings is estimated at £8000.

DUBLIN.—The foundation stone was recently laid of the Howth Presbyterian Church, Dublin. The new building will be spacious, and on handsome architectural lines. Its position on the Howth Road is nearly midway between Sutton and Howth. The design is Gothic, and the length of the body of the church is 25yds. and the width 8yds. A stately and imposing tower is included in the specifications, and everything will be carried out with perfect regard to the purposes of the building. The architect selected to design the church is Mr. Arthur Young, and the builder Mr. Small.

EARLSTON (Scotland).—The Parish Church of Legerwood, in the Presbytery of Earlston, after being closed for eight months, has just been reopened. The alterations on the church at first contemplated were confined to interior improvements, and the restoration of the chancel, to the extent of opening up the arch, giving it a roof and floor, and other details. Afterwards the Building Committee thought it advisable to extend their operations, and make the church exterior in keeping with its Norman chancel, and this accordingly has been done. The pointed Gothic porches and windows have disappeared; windows have been reconstructed, and new Norman windows made, including a circular one in the dead wall of the west gable, 7ft. in diameter, with ten lights. A Norman porch has been built for the south entrance. The chancel has been from the first shut off from the church as useless for the reformed service; the arch was

built up, and has remained so ever since. The building was partially dismantled and unroofed to make a private burial ground, and this has fortunately preserved it from destructive alterations. The only material alteration seems to have been the removal of the gable and making a wide entrance door to the burial ground. Apparently the building has suffered more from the damp and vitiated air of the church than from any mutilating alterations. The details which remain, however, amply justify the restoration as an interesting example of the early Norman of the twelfth century. The archway has been opened up, the gable restored with a circular light, 3ft. in diameter, a corbel eaves course laid for north and south walls. The old windows, which are only 3ft. by 8in., have been opened out, and another made to match them where the door to the burial ground had been broken through. The roof is of the best British oak, with ceiling of the same material formed within intersecting timbers of the roof, which are moulded and have short hammer beams, resting on two massive beams, carried on four large pillars, which had been built with the walls at the corners. The glass of the chancel windows is from designs by Messrs. Ballantine and Gardner, and these are executed in pure mosaic of the richest coloured pot metal glass. The works have been carried out from plans by Messrs. Hardy and Wight, architects, Edinburgh.

GLASGOW.—New premises have just been erected in Renfield Street, to be used as tea rooms. The following are the contractors:—John Dick and Son, masons; James Tait and Co., wrights; Hugh Twaddle and Son, plumbers; Alexander Brown, plasterer; P. and W. Maclellan, iron and steel work; Kean and Wardrop, tile work; James Coombe and Son, heating engineers; James Brown, ventilating; Blackman Ventilating Company, Limited, ventilating fans; William Ramay and Co., gasfitters; Alexander Burns, painter; Claud Hamilton, Limited, electricians; Crossley Brothers, Limited, gas engine; Thomas Aimer and Sons, "cyclone" fan makers; Thomas Hill and Co., engineers; Archibald Stewart and Co., furnishing.

LANCASTER.—The Earl of Derby on Wednesday laid the foundation-stone of an extension of the Royal Albert Asylum, Lancaster. The extension of the asylum will consist of a new wing to be built at the south-east angle of the Brooke wing. It will be about 150ft. long and two stories high. The ground floor will accommodate fifty cripples, and the first floor, which will be level with the ground floor of the main building, will afford room for fifty epileptic patients. The plan is on the "pavilion" principle. The cost of the extension, without furniture, is estimated at about £15,000. The building occupies an elevated position, and has been designed in "a simple, domestic style of Architecture."

LONDON, E.C.—After being closed for a short period, in order to make the necessary preparations for the installation of the electric light, the Church of St. Edmund the King and Martyr in the City has now been reopened. The new system of lighting is certainly a great improvement, and, beautiful as is the interior appearance of the sacred edifice by day, the effect is much more striking when the church is lighted at night. The handsome roof and carving can then be seen to greater advantage than is possible through the gloom which, owing to the lofty nature of the surrounding buildings, usually overhangs the church. A cluster bracket with three lights has been placed on both sides of the Communion table, and besides being fitted with electric light, the wall brackets have all been re-decorated. The work has been carried out by Messrs. Wentworth and Co., of 102, Newgate Street.

MANSFIELD.—The Victoria Hospital at the Mansfield Union Workhouse has just been formally opened. The new structure has been erected at a total cost of some £13,500. The build-

ing is a two story erection, to accommodate 68 patients. The buildings are of brick. The wards are filled in with specially designed hospital windows, having in the lower part double-hung sashes, and in the upper part a sash opening inwards, and are heated by stoves fixed in the centre of the wards which have descending flues carried underneath the floors and up to the external walls. Special attention has been paid to prevent the possibility of the accumulation of dust by avoiding all right angles and undercut mouldings. The whole of the works have been carried out by Mr. John Greenwood, of Mansfield; the boiler and hot water supply by Messrs. C. and F. Sanderson, of Mansfield. The architect was Mr. R. F. Vallance, of the firm of Messrs. Vallance and Westwick.

MORPETH.—The memorial stones of a new Congregational chapel and schools in Dacre Street, Morpeth, have just been laid. Dacre Street, in which the new chapel will stand, is an open and pleasant part of the town, and also possesses the advantage of a fairly central situation. The building, which includes chapel, school, infant class room, ladies' parlour, and rooms for a caretaker, are being erected from designs by Mr. J. W. Taylor, architect, Newcastle. The cost of the whole, land included, may be put down roughly at £2700.

OCKBROOK.—The ancient parish church at Ockbrook, Derbyshire, was re-opened on Sunday week by the Bishop of Southwell, after repairs. The fabric has not been touched, but in the interior there has been a renovation, including reflooring with concrete over the vaults, a new pulpit, and the whole of the chancel has been refurnished, new candelabra have been provided, and there is a general renewal.

Correspondence.

MASONRY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Being interested in masonry, I think a little criticism upon the above article in your issue of the 21st ult. would do good.

The writer begins by saying "Before a mason can hope to grapple successfully with the work entailed in setting out tracery windows he should be familiar with plane geometry." That remark applies to others besides masons, and, as the writer says in his last sentence, "a little examination of the window used as an example will make this clear." "The example chosen to illustrate this article is a simple one." The simpler the better, say I, but let it be fairly workable.

If we are to take these articles as instructions, they ought to deal with the subject in a practical way, as many young men are glad to try and work out such things as they are shown. The practical hand takes them for what they are worth. For instance, what mason would think of putting a label mould directly on a splay or chamfer? Or, would he be likely to treat the bands or fillets in the manner here indicated?

My idea as to drawings such as these is that they should be shown together with the scale from which they are drawn, and also a section should be given, or the drawing is likely to mislead. Again, to omit some of the principal lines, as is here done, is not right. It is usual to show such windows half outside, and half inside in elevation, with a section. The mason has nothing to do with arranging the points. The architect does this. It is advisable that the mason who has to set out tracery should be familiar with plane geometry; but it is also necessary that he should be familiar with construction.—I am, sir, yours faithfully,

ROBERT RAMM,

3, West Grove Villas, Hersham Road,
Walton-on-Thames.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDARE.—For the erection of the Ivy Bush Hotel, Cwmaman, Aberdare. Messrs. Morgan and Elford, architects.

Williams and Williams, Cwmaman ... £1,277 10
ASHTON-UNDER-LYNE.—For sewerage Hill-street, &c. Mr. J. T. Earnshaw, C.E., Town Hall, Ashton-under-Lyne.
 R. C. Fish, Aston-under-Lyne ... Underwood ...

J. W. Brierley ... * Accepted as per schedule prices.

BARNESLEY.—Accepted for the construction of sewers, &c., for the Hoyal Urban District Council. Mr. W. Farrington, C.E., Town Hall, Hoyal, near Barnsley.
 Alex. Brunton and Son, Hull ... £1,292 19 11
 Engineer's estimate, £1,397 138 6d.

BASSALLER (Mon.)—For the erection of four pairs of cottages, for Mr. C. D. Phillips, "Gaer Fach," Newport (Mon.).

Baglow ... £2,103 Partridge ... £1,995
 J. Davies ... 2,095 A. S. Morgan and Co. 1,806
 J. T. Morris ... 2,080 C. H. Reed ... 1,801
 J. Moore ... 2,080 J. Charles, Newport* ... 1,744
 E. C. Jordan ... 2,063 * Accepted.

CAMBRIDGE.—For erecting Professors' houses at Westminster College, Cambridge. Mr. Henry T. Hare, architect, 13, Hart-street, Bloomsbury-square, W.C. Quantities by Mr. G. Fleetwood, 3, New-court, Lincoln's Inn, W.C.

S. F. Halliday ... £4,123 W. Bell and Son ... £3,998
 S. F. Halliday ... 4,050 W. Saint (accepted) ... 3,876
CORK.—For alterations to 88, Old George's-street. Mr. D. J. Buckley, architect, 21, Adelaide-street, Cork.
 J. H. O'Connell ... £254 J. Buckley, Lancaster
 L. Dugan ... 230 Quay, Cork

DOVER.—For the erection of "The Corner Cottage," St. Margaret's Bay, near Dover, for Mr. F. W. Speaight. Messrs. Worsfield and Hayward, architects, Dover. Quantities by Mr. C. F. Poland, 6, John-street, Bedford-row, W.C.

R. Webster ... £1,975 T. T. Denne ... £1,796
 Austin and Lewis ... 1,936 G. H. Denne and Son 1,775
 Hayward & Parnor ... 1,839 J. J. Wise, Deal* ... 1,683
 H. Roffey ... 1,798 * Accepted.

DOVER.—For the erection of a workshop, &c., Marton, for the Town Council. Mr. H. E. Stigoe, C.E., Town Hall, Dover. Quantities by the Borough Engineer.
 J. Parsons ... £439 12 2 Austin and Lewis £389 8 0
 Geo. Monro ... 422 17 2 H. B. Ellis, Dover* 381 18 6
 Engineer's estimate £375

EPPING (Essex).—For additions to isolation hospital, Theydon Garmon, for the Rural District Council. Mr. E. Egan, architect, Holmdale, Loughton. Quantities by Mr. J. E. Holden, 39A, Lombard-street, E.C.

Building. Drainage. Total.

Stewart ... £1,126 Walter Lawrence, Waltham Abbey (accepted) £937
 Porter ... 1,000
 Hawley ... 950
TROEDRYHIW (Wales).—For the erection of eight houses, for Mr. E. Stephens. Mr. C. M. Davies, architect, 112, High-street, Merthyr Tydfil.

Wm. Lloyd ... £1,597 12 T. W. Davies ... £1,344 0
 M. Marlow ... 1,520 0 Jones and Jenkins, Abercynon, Pontypridd* ... 1,120 0
 J. Jones ... 1,520 0
 D. L. Jones ... 1,448 0
 J. James ... 1,376 0
 * Accepted.

WAKEFIELD.—Accepted for the erection of Wesleyan Sunday School, &c., South Kirby, for the Congress. Mr. G. F. Pennington, architect, Carlton-street, Castleford.

H. Gundle, South Gate, Pontefract ... £544
WOOLWICH.—For rebuilding Nos. 37, 39, 41, 43, and 45, Powis-street, Woolwich, for Messrs. Carter. Messrs. Church, Quick, and Whincom, architects, William-street, Woolwich.

Brading ... £4,700 Cheshire, Wallington* £4,200
 Holloway ... 4,394 Thomas and Edge ... 4,169
 Goad ... 4,300 Chapman ... 4,159
 * Accepted.

CONTRACTS OPEN.

TO BUILDERS, &c.

The Guardians of St. Marylebone desire to receive TENDERS for the ERECTION of a NEW MORTUARY at their Infirmary, Rackham-street, Notting Hill, W.

Persons desiring to Tender may obtain bills of quantities and a form of Tender, and inspect the specification and drawings any day from OCTOBER 3rd to 6th (both days inclusive) between the hours of TEN a.m. and FOUR p.m. upon application to the Guardians' Architect, Mr. A. SAXON SNELL, F.R.I.B.A., of 22, Southampton-buildings, Chancery-lane, W.C., and depositing with him a £10 Bank of England note, which will be returned to persons sending bona-fide Tenders in the manner and at the time stipulated.

Quantities by Messrs. NORTHCROFT, SON, and NEIGHBOUR.

Tenders must be signed, sealed, and endorsed "Tender for Infirmary Mortuary," and addressed and delivered to me at my Offices not later than TEN a.m. on MONDAY, OCTOBER 10th, 1898.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
 HENRY T. DUDMAN,
 September 27th, 1898. Clerk to the Guardians.
 Guardians' Offices,
 Northumberland-street, W.

BOROUGH OF CHELTENHAM.

The Corporation of the Borough of Cheltenham invite TENDERS for the ERECTION of a NEW BOILER HOUSE at their Waterworks at Tewkesbury.

Plans, specifications, and conditions may be seen on application to the Water Engineer at the Municipal Offices.

Tender to be sent in to me, the undersigned, endorsed "Tender for Boiler House," at or before TWELVE o'clock at noon on WEDNESDAY, OCTOBER 12th.

The Corporation do not bind themselves to accept the lowest or any Tender.

E. T. BRYDGES,
 Municipal Offices, Cheltenham, Town Clerk.
 September 21st, 1898.

BOROUGH OF TUNBRIDGE WELLS. WORKMEN'S DWELLINGS.

The Corporation are prepared to receive TENDERS for the ERECTION of FIFTY-THREE four-roomed COTTAGES and FIVE BLOCKS of TENEMENTS.

Plans and specification may be seen at the Borough Surveyor's offices, and quantities and forms of Tender obtained from me on payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

The Corporation do not bind themselves to accept the lowest or any Tender. By order,

W. C. CRIPPS,
 Town Hall, Tunbridge Wells. Town Clerk.

TO BUILDERS AND CONTRACTORS.

The Committee of the Croydon General Hospital invite TENDERS for the ERECTION of a NEW WING, &c.

The drawings and specifications may be seen at the Office of the Architect, Mr. CHARLES HENMAN, 64, Cannon-street, E.C., on and after THURSDAY, 29th instant, and bills of quantities there obtained on payment of £3, which will be returned to those who send in a bona-fide Tender.

Tenders to be delivered at the Hospital, London-road, West Croydon, before SEVEN p.m. on FRIDAY, OCTOBER 7th, 1898.

The Committee do not pledge themselves to accept the lowest or any Tender.

By order,
 JOHN JONES,
 Croydon, September, 1898. Secretary.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

SANITARY CONGRESS.

THE INSTITUTE'S PURPOSE AND PROGRESS.

PRACTICAL PAPERS.

BIRMINGHAM has been immersed in sanitary science during the past week. The Sanitary Institute—an organisation which aims at the advancement of sanitary science in all or any of its branches and the diffusion of knowledge relating thereto—has been holding its seventeenth congress there. To know and appreciate how much the Institute has done to ensure the enforcement of the laws of health, to diminish the death-rate, and generally to promote the happiness of the people by improving their physical and moral condition, it is necessary to push back the calendar twenty-two years; to look back to the time when the Sanitary Institute first became a practical force in the country. A flood of light is thrown upon the state of things existing in those days, in the description of Sir Henry Burdett, one of the founders of the Sanitary Institute. The public, we are told, were

IGNORANT AND INDIFFERENT

to the importance of sanitation. The bulk of the members of the medical profession were sceptical as to its value, and disinclined to recognise it as a force by the utilisation of which they could materially improve the public health. Very few houses were properly drained; most of the Government houses, and even the Queen's palaces, were very insanitary. There was an absence of provision for the isolation of infectious diseases, and the adequate treatment of infected patients. The water supply nearly everywhere was indifferent or defective, and the systems of drainage, in many places, were bad. The mortality in the best hospitals after serious surgical operations was 37·8 per cent. There was little

LITERATURE ON THE SUBJECT OF SANITATION,

and that which existed was mostly buried in Blue Books not readily accessible. There was no test of competence, and no means of training persons as sanitary officials. Local surveyors, inspectors of nuisances, and even medical officers of health were all without special training or qualification, and did not possess accurate knowledge or information. Little wonder was it that the Government had been appealed to on the subject. The National Association for the Promotion of Social Science and the British Medical Association both made a clear demand for an authorised inquiry into the defects of the sanitary laws. The

PASSING OF THE PUBLIC HEALTH ACT,

which came into operation in 1875, was an important advance in those days of imperfect sanitary conditions. The feeling soon began to spread that the increasing importance attached to sanitary science, and the recognised position it was assuming in the public mind, pointed to the need of a society devoted exclusively to the advancement of all subjects bearing upon public health. "The Sanitary Institute of Great Britain" was the direct outcome of this feeling, an initial meeting, held at St. James's Hall, London, in July, 1876, under the presidency of the Duke of Northumberland, resolving upon the formation of the society "for the purpose of collecting and imparting information upon all matters connected with the subject of public health." The meeting was impressed with the fact that the sanitary condition of the country was still very unsatisfactory, and that further legislation was necessary with a view to its improvement. That the aspirations of the founders have been largely realised in one important respect may be gathered from statistics. The mortality in regard to the more serious surgical operations in hospitals has fallen from 37·8 to something like 2 per cent., whilst the number of these operations has increased a hundredfold. So much for the sanitary conditions in which the early days of the Institute were enveloped. Having been formed in 1876 the good, practical side of the

Institute's being quickly showed signs of development. One of the primary steps was to establish examinations for local surveyors and inspectors of nuisances, and the first examination was held in October, 1877, when eight candidates presented themselves. The fact was at this time pretty plainly revealed that candidates for appointment as sanitary officers had considerable difficulty in obtaining knowledge of the principles of sanitation. To overcome this disadvantage the Council established

SYSTEMATIC COURSES OF INSTRUCTION

suitable for these officers. In 1890 the examinations, until then held in London, were extended to the provinces, and, proceeding in the good work, the following year saw the training lectures for sanitary officers also extended to the provinces, and arranged in conjunction with the County Councils. In the Public Health (London) Act, which was passed in that year, the Institute was able to obtain the insertion of a clause requiring all Sanitary Inspectors in London, appointed after January 1st, 1895, to hold a certificate of qualification. Passing on to 1892, we find a further step in advance. Steps were then taken for adding practical demonstrations to the course of lectures for sanitary officers, and visits for the students were arranged to sewage works, water works, trade premises, and other places that would be instructive from a sanitary point of view. These practical demonstrations were considerably extended, and were elaborately organised in the following year. A suggestion was made by the Royal Meteorological Society, and by it to the Sanitary Institute, that many medical officers of health and others would be glad to gain some information on the important question of weather and climate in relation to health and disease. As the question involved both meteorology and hygiene, it was thought well by the respective Councils that the two should jointly arrange a course of lectures upon the subject. It was known that many persons, having no intention of becoming sanitary officers, yet were wishful to obtain

A CERTIFICATE FROM THE SANITARY INSTITUTE indicating their knowledge of sanitary science, and to meet this class the Council arranged a syllabus which, while not including many technical subjects that an inspector is required to know, is of a higher standard than the inspectors' examination as far as it relates to practical sanitation. The examination is arranged so as to be suitable for foremen of works, builders, and those engaged in allied trades, managers of property, teachers, and lecturers, and others requiring a thorough knowledge of the practical sanitary science. The question of extending the examination scheme to the Colonies is still under the consideration of the Council. A tabulated record shows that since they were established in 1877, there had, up to last year, been 35 examinations for local surveyors; 291 candidates entered, and 142 were certificated; in practical sanitary science there were 15 examinations, 159 candidates entered, and 83 were certificated; and there were 96 examinations for sanitary inspectors, 4333 entered, and 2493 were certificated. Therefore, in the 20 years 146 examinations were held, 4783 candidates entered, and 2718 were certificated. In the same year that the Sanitary Institute was formed the

PARKES MUSEUM OF HYGIENE

was instituted as a permanent memorial of Dr. Edmund Alexander Parkes, the first Professor of Hygiene at Netley. After working together for five years the Sanitary Institute and the Parkes Museum were amalgamated and reincorporated under the title of "The Sanitary Congress," the words "of Great Britain" being deleted. The Museum in Margaret Street is now recognised by the Science and Art Department in connection with their classes, and the class visits paid by students to the Museum may be counted as a class attendance for the purpose of the examination grant. The diffusion of sanitary knowledge is still further aided by meetings which are held for the reading and discussion of papers; by means of a library containing works on hygiene and sanitation, Parliamentary

and other official reports, and transactions of other societies; and through the medium of the "Transactions," which are published in the form of a quarterly journal. Naturally the provincial congresses, such as the one held in Birmingham during the past week, are looked upon as the most important means of spreading the advantages of the Institute throughout the country. Connected therewith is the Health Exhibition, which opened at Bingley Hall, on Tuesday of last week, an institution which has been associated with the meetings of the Institute since the first Congress at Leamington Spa. As we have already noted, it is an exhibition of up-to-date sanitary apparatus and appliances, and medals and certificates are awarded by a special staff of judges, the system adopted being notable for its uniformity. We hope to deal in detail with this exhibition in our next issue.

PRESIDENTIAL ADDRESS.

The inaugural proceedings of the Congress opened on Tuesday of last week. The feature of the first day was the presidential address delivered by Sir Joseph Fayer. Sir Joseph said: We lived in an age of progress and discovery. Intellectual activity had never been greater, scientific research never more profound or far-reaching, whilst the practical applications of the discoveries of science were not less remarkable. Among many subjects of interest which were laid before the Queen on the completion of the sixtieth year of her glorious reign, few, perhaps, afforded better ground for congratulation than the improvement in the vital statistics of her people, as shown by reduced death-rate, enhanced expectation of life, decline in some of the most potential death causes, and the almost total disappearance of others. In effecting this improvement the Institute had taken an important part. The object which it had kept steadily before it from the outset had been the advancement of sanitary science by the promulgation of sound scientific and practical teaching of those principles on which health depended, by which life was prolonged, and the physical, and thereby the moral, welfare of the people promoted. As an illustration of the progress made, it might be stated that when the first Congress took place in 1877, there were 150 members, and the income was £240. In 1896 the members were 2100, and the income £6000. In 1877 five candidates were examined for certificates; in 1896 521 were examined, of whom 300 obtained certificates. The time at his disposal did not permit him to trace in detail the history of

THE GROWTH OF SANITARY SCIENCE

from times of ignorance and superstition to its present well-established foundation on a scientific basis. It was only comparatively recently, however, that preventive, as distinguished from curative, medicine had assumed the position of a science. It was now, from a hygienic point of view, the more important of the two, though the difficulties attending its application were still considerable, and largely such as arose from ignorance and incredulity. Half a century ago the great mass of the population lived and died under conditions which violated all the now well-known principles on which health depended, but measures which were then regarded as mere theories or fads of no practical value, were now accepted as of cardinal importance. Statesmen had learnt to realise that sanitary science came well within the sphere of practical politics, and that it was an important part of the duty of executive governments to protect the people from disease which might be prevented or controlled. Acts of Parliament, officers of health, sanitary engineers, and sanitary inspectors had produced a better state of things, and the poor were no longer left to be a law unto themselves. Public health was cared for in a sense which was utterly unknown in the past; and, were all the existing official provisions enforced, little would remain to be desired on the part of the Executive Government, but as some of the Acts were permissive and not compulsory, and as others were utterly neglected, much of the benefit they might confer was lost. Though education had done much as far as the better classes were concerned,

and though upwards of 200 millions had been spent on sanitary work, with great benefit to the public health, popular teaching and example, and the general diffusion of education, were still necessary in order to convince the proletariat of what so intimately concerned their vital interests. The death-rate was susceptible of further diminution, expectancy of life might still be enhanced, and the general conditions of living and exemption from certain forms of disease were by no means as perfect as they might be, and it would perhaps not be until the more complete organisation of the public health administration, under a minister of public health, was effected that the full benefits of sanitary legislation would be realised, and the people attain to that standard of health and duration of life for which they had a right to hope. Even the great cities, with all their improvements, left much to be desired. Birmingham, according to the journals, notwithstanding the splendid municipal arrangements for which it was remarkable, had still a higher death-rate than some other great cities. Since 1882 up to 1897 it had stood at from 21.6 to 20.2, and the same authority pointed out sanitary defects which one might venture to think could be ameliorated. Nevertheless, when the present state of the country, with its 31 millions of inhabitants, was contrasted with that of

THE ELIZABETHAN ERA WITH ITS FOUR MILLIONS,

there was ample proof of the ignorance of science in those days and of the great improvements which have taken place in these. Many of the diseases of that time had disappeared—never, it was hoped, to return—and others had been mitigated. But could they feel confident that the immunity would continue? He was afraid not. Sudden invasions of cholera and other epidemics, and, as now, of plague in India, were warnings that vigilance must never be relaxed. But the experience of the country under the greatly-improved sanitary administration of the present time had shown how much they might rely on preventive measures wisely enforced, especially when they were based on experience and enlightened observation, and not upon mere theories of causation. A brief inquiry into the statistics of some well-known diseases would show that they had become less severe in their incidence, if not less frequent in their recurrence. The scope and aim of sanitary science in its preventive aspects should not be limited to the consideration of zymotic and other acute diseases, but should extend to the results of abnormal social conditions arising out of the strain and struggle for existence. The influence exerted on vital statistics by sanitary science might be seen by reference to the returns of the Registrar-General. One indication of its effect was observed in the death-rate of the country. In 1841-50 it stood at 22.4 per thousand; in 1891-95 at 18.7 per thousand; but for the four years 1890-1893, it had risen owing to epidemic influenza—the lowest rate, 1884, having been 16.6 per thousand. It was susceptible of

CONSIDERABLE MODIFICATION,

and, as they knew how it might be increased or diminished, it behoved the nation to exert its power and stand credited with the lowest figure. In fact, it was, within certain limits, at their own control, and whether the people should die at the rate of 13 or 23 per thousand depended on how they recognised their responsibility and put in force sanitary regulations. Sanitarians could say how it was to be done, and were perpetually saying it; but more money, more faith, more energy were needed to deal with the question satisfactorily. The death-rate has fallen proportionately more in the towns than among the rural population. Statistics showed that in 1838 to 1854 the mean expectation of life was for males 39.81, for females 41.85 years. From 1871-80 it had increased to 41.35 for males and 44.66 for females. When registration commenced, the mean duration of life in Surrey was 45 years. It was not more than 37 years in the metropolis and 26 years in Liverpool. Now the mean duration of life throughout the whole of England and Wales was higher than

the first-named figures. Eventually, a great future was before preventive medicine, and they might confidently look to the eminent men of science who were now pursuing with such indefatigable zeal their researches into the mysteries of bacteriology for its fulfilment. But those who admired and appreciated their work the most, and looked forward hopefully to its results, were anxious that progress should not be retarded by hasty deduction and premature generalisation, which might only end in disappointment. He ventured to suggest that however great might be the importance of the study of bacteriology, and the various conclusions resulting from it with regard to the origin, diffusion, and prevention of disease, there were other factors of no less importance to be considered, and it could only be by the study of all those that we could hope to arrive at the complete knowledge which would enable them to fulfil the requirements of sanitary science. Whilst on the one hand it was of the utmost significance that they should be able to demonstrate the actual cause, whether a micro-organism or not, on the other hand it was not of less—nay, from a practical sanitary point of view it was of more—importance that they should know all the conditions under which that cause became effective.

MUNICIPAL AND COUNTY ENGINEERS.

Addressing a conference of municipal and county engineers, Mr. T. de Courcy Meade, as president, said the duties of the municipal engineer had been divided into six heads, which embraced no less than ninety-eight distinct subjects. It was, therefore, not surprising that the municipal engineer should always be a student, anxious to learn all that was new, and desirous to benefit by the experience of other engineers. It should not, however, be forgotten that the communities, whose representatives they served, reaped the benefits of the knowledge thus gained. The housing of the working classes, although a well-worn topic, was likely to be of interest. The difficulties of providing sufficient suitable accommodation at a reasonable cost were great, but in Manchester they had been overcome by the erection, on the cleared sites, of blocks of five-storied tenements, approached by common stairs and balconies; blocks of tenements of two and three rooms, with separate entrance and stairs to each set of tenements; terrace cottages of five rooms each, and a model lodging-house. The Manchester Corporation were also erecting cottage dwellings in the outskirts of the city, about two and a half miles from the cleared areas, where land was less costly. These cottages varied somewhat in character, and each contained from five to seven rooms. Much work had also been done in the improvement of existing dwellings and the conversion of "back-to-back" houses into "through" houses. This work, though excellent where it was effected, had a tendency to cause over-crowding elsewhere, as the number of persons that could be accommodated in the converted and improved dwellings was much less than was crowded into the "back-to-back" houses before alteration. The substitution of private water-closets for common pail-closets and privies was gradually proceeding, the water system being provided whenever alterations to property were effected by the Corporation.

NEW STREETS AND BUILDINGS BY-LAWS.

Several sectional meetings were held on Wednesday, the second day of the Congress. Mr. J. S. Pickering (Nuneaton) read a paper on "By-laws Relating to New Streets and Buildings." It was true, he said, that the by-laws made since the passing of the 1875 Act generally adhered closely to the "model" series of 1877, but this was not so much on account of their general suitability to the districts for which they were adopted as to the fact that the Local Government Board would not sanction any important departure from their "model" code. The result was that many authorities possessed no by-laws, others depended upon by-laws of doubtful validity, made under former Sanitary Acts, while the great majority did not enforce the particular by-laws they had been compelled to include in adopting the "model" series. The varying

circumstances of different districts, he contended, made it impossible to frame a series of by-laws applicable to all. By-laws, for instance, affecting new streets and buildings in large towns, would be altogether unsuited to the requirements of the villages of rural districts. But obvious as that was, it was a matter which was overlooked, and accounted for the absence of by-laws in many rural sanitary districts. It appeared to him that many provisions contained in by-laws might with advantage be incorporated in the Sanitary Acts, making them statutory enactments rather than measures to be adopted at the option of local authorities. By-laws should also be made less comprehensive.

SEWER VENTILATION.

Mr. T. J. Moss Flower read a paper on "Precautions to be Observed in the Ventilation of Sewers and Drains." The object aimed at was to prevent the evolution of gases, and to carry harmlessly from the sewers the gases that could not, owing to the physical conditions that existed in sewers, be prevented. With good falls and plenty of flushing all foul matter could be removed before decomposition set in, and unless that could be done a nuisance must arise. Sewers of deposit should be reconstructed, and surface gratings not fixed in narrow streets. Shafts should be fixed to the tallest buildings. High factories and churches might well be used for fixing the shafts to, and the gases so delivered could not do harm. The law should allow of local authorities fixing sewer vents to the houses. In drains the disconnecting trap should be of a self-cleaning nature.

SEWAGE DISPOSAL.

Much interest seemed to be aroused by two papers on sewage disposal. The Rev. Dr. C. Cox read a paper on "Village Sewerage Schemes: Experiments in the Rural District of Brisworth." The moral he drew from these experiences was that rural authorities with small populations should try every other expedient before resorting to water carriage, and that pressure that should be brought to bear upon the Local Government Board to remodel its procedure, and no longer sanction loans for tiny filtration beds with a clay subsoil.—Alderman Compston (Rawtenstall) read a paper entitled "Sewage Disposal and Official Hindrance," in which he said that the natural difficulties were usually augmented by the withholding by the Local Government Board of its sanction from any method, no matter how suitable for efficient local conditions, unless vast areas of land were purchased also. The writer instanced Maidstone, which had an obsolete and most execrable system of sewers, which it was prevented in this way from reconstructing. In the crowded parts of Lancashire this was a very serious question.

PUBLIC SLAUGHTERHOUSES.

Mr. E. Parkes, M.P., read a paper on "Municipal Authorities and Public Slaughterhouses," in the course of which he gave, with the aid of plans, an account of the Birmingham new meat market and slaughterhouses. He urged that the existence of so many private slaughterhouses, often in a very insanitary condition, and placed in the midst of a dense population, was one of the greatest drawbacks they had in England in dealing with the whole subject. Their Parliamentary powers were insufficient to deal with the evil. In the case of new communities and new areas in this country no doubt it could be and was being dealt with, but in the large towns vested interests were so sacred and the number of registered and licensed slaughterhouses was so numerous that they presented an almost impassable barrier to those who desire to see things altered for the better.

(To be continued.)

AN English syndicate has been formed for the purpose of constructing an electric railway to connect Italy and Switzerland. The proposed line would pass over the great Saint Bernard mountain from Aosta to Martigny, and would be about 45 miles long. The cost is estimated at 15,000,000 francs.

PRACTICAL CARPENTRY AND JOINERY.*

By GEORGE ELLIS.

(Continued from page xlv.)

X.—SHUTTERS.

SHUTTERS may, for the purpose of description, be conveniently divided into two kinds, exterior and interior, each kind having special requirements to fulfil; of the latter there are three varieties—viz., boxing, sliding, and rolling; of the former four, hinged or wall shutters, framed or lifting ditto, revolving or spring ditto, and Venetian or louver.

BOXING SHUTTERS, so termed because they fold into a boxing or recess formed between the window frame and the surface of the wall, are composed of a number of narrow leaves, panelled or plain, rebated and hinged to each other, and to the window frame; they must be of such size that when closed they will cover the entire sight line of the window and a margin of at least $\frac{3}{4}$ in. in addition. They must be arranged to swing clear of the edge of the boxing, and so as not to bind upon the window board, or rub the soffit. The first of these clearances is effected by making each leaf of the shutters smaller than the one immediately in front of it; and the latter, by thin guard beads, planted on the faces of window board and soffit, as shown in the sectional elevation (Fig. 161). The leaf that becomes the outer one when the set is inclosed is termed the front shutter, all the others being known as flaps; in some instances the flaps are too narrow to frame, and a plain board is used, but it should always be mitre-cramped to prevent warping. It is not advisable to make the shutters less than $1\frac{1}{4}$ in. thick, and all flaps over 8 in. wide should be framed; when the number of flaps required to cover the window necessitates too deep a boxing to be inserted in a square reveal, the difficulty may be overcome by splaying the jambs, thus obtaining increased width of shutter, and consequently fewer flaps, as shown in Fig. 162, which is an example of a splayed boxing for a 3 ft. 6 in. window in an 18 in. wall; or otherwise, the boxing may be projected into the room and covered with a wide architrave or pilaster, as at B, Fig. 160. The boxings in work of a superior class are covered by a moulded frame termed the cover flap hung to the architrave so that it may swing to permit the passage of the shutters, and to be closed again afterwards, thus restoring the symmetry of the linings. When Venetian or other blinds are used inside, provision for them must be made by affixing a block frame of the required thickness to the sash frame, and hanging the shutters thereto as shown at a plan B, Fig. 160 and also in Fig. 161. This frame should be out of stuff, 3 in. by 2 in., tongued and glued to the sash-frame, and where a cover-flap is used as at B, Fig. 160, the jambs of the blind frame must be worked to a mitre, and a small flap, of sufficient width to carry the remaining flaps to the back of the boxing must be mitred and hung thereto, a $\frac{1}{2}$ in. stop must also be worked or planted on the face of flap for the cover to strike against when the shutters are folded. In the example given, the hanging

FIG. 161. SECTIONAL ELEVATION OF BOXING SHUTTERS.

FIG. 160. TWO HALF PLANS OF BOXING SHUTTERS.

FIG. 162. PLAN OF SPLAYED BOXING.

stile of the framed pilaster is made in two pieces down to the bottom of the boxing, and hinged together, a small bead being stuck on one edge to break the joint; this is for the purpose of obtaining the necessary clearance to close the cover when the shutters are out, and which is then stopped by the rebates of soffit and window board. The back lining of the boxing is fixed to the grounds, and the pilaster grooved and glued to the lining. It will be seen by reference to Fig. 161 that a curtain-box is provided outside the shutters by carrying a cornice with returned ends across the opening, and lining the edge of soffit. Butt hinges are used for hanging the shutters and covers, but wider flanged hinges, called back-flaps, are used for the flaps, and are screwed upon the back face instead of the edges. A flat iron bar hung on a pivot at one end to the first flap, and having a projecting stud at its other end, which is entered into a slotted plate on the opposite flap and kept in position by a kind of button, secures the shutters when closed; when open, it hangs down in a vertical position between the flaps. In arranging these finishings to a window, the stiles of the elbow linings and soffit should be made to range with those of the shutters, and the stiles of the window back to show a similar margin; the stiles of the

window back should be wide enough to run behind the elbows, and the latter be tongued and glued into it.

VERTICAL SLIDING SHUTTERS, Figs. 163 and 164, are used in houses of an inferior class to the above, as being more economical in construction than boxing shutters; they consist of two thin panelled frames the full width, and each half the height of the window, hung on pulleys in a cased frame, in a similar manner to a pair of double-hung sashes. The frame extends from the floor to the soffit, and the window board is hinged to the front panelling; when this is lifted, the shutters can pass down below it, and lie hidden from sight during the day by the window back. Cover flaps hung to the outer linings on each side, close over the face of the pulley stiles, and hide the cords. When it is desired to close the shutters, the cover flaps are opened back flat, the window board lifted, and the shutters run up, a pair of flush rings being fixed in the top rails for this purpose. The window board is next shut down, the inner shutter brought down upon it, the outer one pushed tight up to the head, and the meeting rails which overlap an inch, fastened with a thumbscrew. The bottom rail of the upper shutter is made $\frac{1}{2}$ in. wider than the other rails for the purpose of showing an equal margin when overlapped. Where there is not sufficient depth between the window sill and the floor to receive the shutters, the casing must be carried below the floor, and the joists trimmed or cut back as in Fig. 164—this is a vertical section through the window opening showing the framed window back, with the window board hung to it, and rebated into the bottom rail of a blind frame. The shutters are "down." In the right hand half plan, Fig. 163, the window board and cover flap are closed; in the left half, these are open ready for the lifting of the shutters. Square lead weights are generally used for these frames, as the space is limited, and the shutters heavier than sashes of a corresponding size.

(To be continued.)

FIG. 163. SECTIONAL PLAN OF SLIDING SHUTTERS.

Surveying and Sanitary Notes.

THE Bristol Sanitary Committee have discussed in private the report of Messrs. Taylor, Sons, and Santo Crimp on the question of the disposal of the city sewage. The scheme for discharging the sewage at Avonmouth and Dunball was most favoured by the committee. The engineers estimated the cost of the undertaking at £379,000, the sum required for repayment of capital and interest being £15,487, and, with an extra cost of £2000 for pumping, the annual expenditure would be about £18,000. It was estimated that after forty-five years the annual cost would be only £2500. The report will be sent on to the Council.

THE Sanitary Department of the City Corporation applied to his Worship for an order to have a house in Bow Street, the property of Rose Cunningham, closed as being dangerous to health. It was shown that the drainage was most defective, and the dwelling house was in need of limewashing. Sir Charles Cameron said the odour in the house was

FIG 164. VERTICAL SECTION OF SLIDING SHUTTERS.

terrible, and there was an entire want of cleanliness, which was injurious to health. The order asked for was granted. Prohibitory orders were also made in the case of several other houses in which it was shown the sanitary accommodation was defective.

THE continuance of the long spell of hot and dry weather (says "The Public Health Engineer") is occasioning a considerable amount of concern at Birmingham. Owing to the enormous increase in the population and the extension of the city boundaries, the supply of water under normal conditions does not allow much margin. The Welsh water scheme is being pushed forward as rapidly as possible, but a very long period must elapse before water from this source is available. The danger of a water famine is imminent, unless there is a break in the weather very soon. The streams from which a considerable proportion of the daily supply is obtained are yielding very much diminished quantities, and demands have to be made upon the reservoir storage to an extent which is causing the Water Committee to look to the future with

alarm. Appeals have already been issued to the public to curtail as much as possible the use of water, and the department themselves have restricted the watering of the streets to a narrow area in the centre of the city.

DAILY conferences take place between the city authorities upon the subject, and it is anticipated that an intermittent and restricted supply will have to be resorted to unless there is a fall of rain within the next few days. A considerable amount of inconvenience is being caused at ironworks in the district both by the heat and the drought. Mills and forges are standing, the puddlers being unable to work the day shifts at the fires; but the nights are comparatively cold, and night turns are general. The water supply at many works has been obtained from streams, but these have dried up, and where large quantities are used temporary provision has not been possible, and the works are standing. It is many years since there has been so much interruption to work on account of the weather. Traffic on the Grand Junction Canal between London and Birmingham is seriously impeded. The supply of water is so low that only reduced loads can pass along in the boats. Traffic on the Aylesbury and Wendover branch is entirely stopped. Such shortness of water in the canal has not been known for half a century. Through the drought the supply of canal reservoir water has been exhausted, and the Grand Junction are now pumping back lockage water.

MR. UNDER-SHERIFF BURCHELL and a special jury, at Red Lion Square, Holborn, heard the case of "Hill's Trustees v. the School Board for London." This was a claim for compensation in respect of the freehold interest in premises, Nos. 70, 72, 74, and 74a, Tanner Street, and Nos. 1 to 8, Assembly Place, Bermondsey, the site being required for a Board School. Mr. Littler, Q.C., and Mr. Bartley Dennis appeared for the claimants; Sir William Marriott, Q.C., and Mr. A. J. Ram represented the School Board. Mr. Littler stated that the property had been in the possession of the claimants since 1874, and had steadily increased in value, especially since the opening of the Tower Bridge and the extensive clearance of property in the vicinity. He called Mr. E. H. Eason (Messrs. Reynolds and Eason), who stated that the area of the property in question was 14,730ft., which he valued at 4d. per foot per annum, or £245 10s., and capitalised at 25 years' purchase, £6137. From that he deducted £452 in respect of existing leases, making £5685, to which he added £933 for the buildings and 10 per cent. for compulsory sale, making a total claim of £7280.—Mr. James F. Field (Messrs. Field and Sons), ex-president of the Auctioneers' Institute, and Professor Bannister Fletcher gave confirmatory evidence.—On behalf of the School Board, Sir William Marriott admitted that property in Bermondsey had been increasing in value owing to the erection of the Tower Bridge, but the fact that the property in question had not been included in the betterment area of the Tower Bridge (Approaches) Bill showed that it was not likely to be enhanced in value. He called Mr. Samuel Walker (Messrs. Walker and Sons), who valued a portion of the land at 4d. per foot, and the remainder, back land, at 2d. per foot, as a cleared site. His detailed valuation amounted to a total of £3948, to which he added 10 per cent., the customary allowance for compulsory sale, making £4340.—Mr. W. P. Goulding, Mr. David Burnett (Messrs. Bean, Burnett, and Eldridge), and Mr. J. R. Cooper (Messrs. Ventom, Bull, and Cooper) gave similar evidence as to value.—The jury awarded the claimants the sum of £6150, plus an allowance of 10 per cent. for compulsory sale, £615, making a total compensation of £6765.

THE reconstruction of the sea wall and promenade at Herne Bay, which were so extensively damaged in the destructive gales of last November, is to be proceeded with at once, the cost being estimated by Mr. Baldwin Latham at £40,000.

Builders' Notes.

ALL of us are aware that the cost of building operations has increased to an enormous extent within the past year or two, but few, probably, save those immediately interested, have any conception of what the advance has really been. A year ago £1100 was paid to a builder for the erection of a villa in a northern suburb. To-day the builder requires an additional £300 for the erection of a sister villa in the same thoroughfare.

At the Westminster Police Court last week the summons taken out by the London County Council against the owner of Abbey Mansions (north block), Victoria Street, Westminster, under the dangerous structure clauses of the London Building Act, again came before Mr. Marsham. Mr. Pollard was counsel for Mr. Pawley, the owner of the building, and Mr. Seager Berry represented the County Council. The summons before the Court had reference to the alleged unsafe condition of the stonework of the angle turret, which the County Council demanded should be taken down on the ground that it was cracked and defective. After much argument at the previous hearing, and contention by the defendant that the building was vested in the Government and therefore exempt from the district surveyor's orders, the magistrate, without prejudice to the legal question, got the parties to agree to submit matters in dispute to an arbitrator, whose report should be enforceable as an order of the Court. On Friday week the superintending architect of the County Council, on the further report of Mr. Drury, surveyor, caused a fresh notice to be served on the defendant to take down the alleged defective stonework between the first and second floor windows. Mr. Pollard complained of this action as a breach of faith, and of the fair understanding which was arrived at. At the previous proceedings the district surveyor had tried to get in other matters besides the turret, but his worship confined the reference to the arbitrator (Mr. Clifton) to the matter specified in the summons. If the owner permitted the reference to be enlarged, he might be fired at in every direction by the County Council. Sooner than have this constant attack and changes of front on the part of the Council, Mr. Pawley would ask for the decision of the Court on the legal question, his worship having decided in the previous proceedings that a physical occupation was necessary, and that the agreement produced showed that the place was vested in the Crown.

MR. SEAGER BERRY, for the Council, reminded the Court that Mr. Drury had already spoken of the fresh cracks which he noticed after his report, on which the summons issued. The County Council were perfectly ready to abide by the reference agreed upon by the Court, but still the district surveyor, as a public official, would not take the responsibility for what he considered to be a defective building. It might be excess of caution, but he had served a fresh notice for what he thought was a fresh defect. This was not the subject of a summons at present.—Mr. Marsham inquired what were the signs of alteration since the previous Thursday?—Mr. Drury replied that the cracks had widened; he was of opinion that they had opened since Saturday.—Mr. Pollard said it was all very well to make this assertion. In fairness he demanded that the architect for the owner should be sworn and give his evidence of things.—Mr. J. H. Goodland, architect, then tendered himself as a witness, and swore that there was no danger to the public whatever in respect of the building. The only changes which were noticeable were due to the vibration caused by inserting the strengthening steel bands, three of which were now in position.—Mr. Berry said he would not cross-examine, as the arbitrator would report.—Mr. Marsham adjourned the summons for three weeks, deciding that the arbitrator must report in accordance with the terms of the written agreement signed by the parties in court.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Oct. 7	Croydon—New Wing to Hospital	Committee	C. Heuman, 64, Cannon-street, E.C.
